Sacramento, Cal.

WEDNESDAY AND THURSDAY

April 6-7, 1921

40 DAUGHTERS OF SIR AAGGIE DE KOL ACME, son of Aaggie Acme of Riverside 2nd, whose production of 1,331.78 lbs. butter in one year is the world's strictly official record, and she is the dam of Miss Aaggie Acme Burke, 1,034.44 lbs. butter in one year from 24,338.6 lbs. milk as a first calf junior 2 year old, a world's record when made, and she in turn the dam of the $41,000.00 bull King Korndyke Pontiac Acme.

30 DAUGHTERS OF KING KORNDYKE PONTIAC, son of King of the Pontiacs, and sire of the $12,000.00 bull King Korndyke Pontiac 20th, who in turn sired the $41,000.00 bull King Korndyke Pontiac Acme. He has A. R. O. daughters with records up to over 31 lbs. butter in 7 days.

30 DAUGHTERS OF PRINCE GELSCHE WALKER KORNDYKE, son of Prince Gelsche Walker, and out of the same dam as King Korndyke Pontiac. He already has a list of A. R. O. daughters with records up to over 31 lbs. butter in 7 days.

HERE IS AN OPPORTUNITY TO BUY ENTIRE FOUNDATION HERDS, MADE UP OF HEIFERS OF THE MOST POPULAR BREEDING IN CALIFORNIA TODAY!

MORE THAN 25 FEMALES BRED TO SIR AAGGIE DE KOL ACME are in the offering, including high record cows and daughters of high record cows.

MORE THAN 30 FEMALES BRED TO KING KORNDYKE PONTIAC are in the sale, including some of the choicest in the herd.

EXCEPT FOR THIS DISPERSAL you would not have the opportunity to buy daughters of these great bulls in numbers, and probably never again will so many of them be available at one time. THIS BLOOD IS BUILDING FORTUNES FOR MANY BREEDERS IN CALIFORNIA. WILL YOU TURN THIS SALE TO YOUR OWN ADVANTAGE?

THIS ENTIRE HERD as a whole is strong in type, and the cattle are well grown, and now in excellent condition. In other words they are in prime condition to go right ahead making profit for their new owners.

AS DAIRY CATTLE this herd is leading the entire Sacramento-Yolo Cow Testing Association, amply justifying the rich breeding that would stamp them as producers on pedigree alone.

A Small Sample of the Females to be Sold:

A 34 POUND 3 YEAR OLD sired by Adventure Lad, a 31 lb. son of Spring Farm King Pontiac 6th.
A 27.99 POUND 3 YEAR OLD daughter of Adventure Lad, out of a 27 lb. double granddaughter of Johanna McKinley Segis.
A 22 POUND 3 YEAR OLD daughter of Adventure Lad out of a 28 lb. granddaughter of Johanna De Colantha Champion.
A 27.95 POUND 3 YEAR OLD granddaughter of King Korndyke Sadie Vale, and her daughter by Sir Aaggie De Kol Acme.
A 28.89 POUND COW, a beautiful individual, and her two daughters by King Korndyke Pontiac.
A 22 POUND JUNIOR 2 YEAR OLD DAUGHTER OF KING KORNDYKE PONTIAC, bred to Sir Aaggie De Kol Acme.
A 20.36 POUND JUNIOR 2 YEAR OLD daughter of King Korndyke Pontiac.
A 23 POUND SENIOR 2 YEAR OLD daughter of King Korndyke Pontiac.
A 21 POUND JUNIOR 2 YEAR OLD daughter of King Korndyke Pontiac, bred to Sir Aaggie De Kol Acme.
TWO DAUGHTERS OF KING KORNDYKE PONTIAC out of a 26 lb. granddaughter of Johanna McKinley Segis.
A DAUGHTER OF KING KORNDYKE PONTIAC out of a 25 lb. daughter of Sir Skylark Ormsby Hengerveld.
A 16 POUND JUNIOR 2 YEAR OLD daughter of King Korndyke Pontiac and her full sister out of the same dam as a 34 lb. 3 year old.
A 25 POUND granddaughter of King of the Pontiacs, bred to Sir Aaggie De Kol Acme.
A 23 POUND DAUGHTER OF KING KORNDYKE SADIE VALE. Her 7 nearest dams average 33.86 lbs. butter in 7 days.
A 24.84 POUND 4 YEAR OLD daughter of King Korndyke Pontiac out of a granddaughter of King Segis Pontiac.
A 25 POUND JUNIOR 3 YEAR OLD daughter of Sir Aaggie De Kol Acme, out of a 23 lb. daughter of Dutchland Sir Korndyke Colantha.
A 24 POUND 3 YEAR OLD daughter of Star Youth Korndyke Wayne, bred to King Korndyke Pontiac.
A 21 POUND granddaughter of King of the Pontiacs, and her daughter by Sir Aaggie De Kol Acme.
A 25 POUND 4 YEAR OLD granddaughter of King Korndyke Sadie Vale.
A 24 POUND 4 YEAR OLD daughter of Cornucopia Korndyke Pontiac.

Look at These Ages!

About 25 heifer calves born in 1921; 69 heifers born in 1919 and 1920; 45 heifers born in 1917 and 1918; 18 born in 1916; 12 born in 1915; 6 born in 1914; and only 8 born in 1913 or earlier. Only 1 female in entire herd born in 1911 or earlier.

WRITE FOR A CATALOG. They will be ready March 26. This is the opportunity you have dreamed about to buy young females of Prince Gelsche Walker—Aaggie Acme—King of the Pontiacs breeding.

Every animal positively guaranteed to be a breeder; no tuberculin test certificates.

The owner is prepared to extend most liberal terms to those who make arrangements for credit with him prior to sale. Applications may now be made either in person or by letter to FRED W. KIESEL, California National Bank, Sacramento, Calif.

SAVE THE HARNESS AND SAVE MONEY

IF there ever was a time when a farmer could afford to neglect proper care of harness, that time is long since passed and nowadays with leather "sky high" (and hides almost unsalable) the thrifty farmer will do well to spend a few of the rainy days in going over his horse gear. Some very practical suggestions as to the care of harness are offered in a recent government bulletin, from which we quote:

Harness made of good leather and heavy enough for the work required of it will last for many years if cared for properly. It is more economical to buy harness that is too heavy than to buy that which is too light for the work. With good care, harness of the proper weight and quality will last at least 15 years, and in many cases harness used on the farm has been in service for 25 years or longer. On the other hand, the department of agriculture has received many reports, especially from the Southern states, showing that harness lasts only from two to five years. This should not be so. It means that the harness used is too light, of poor quality, or is not properly cared for.

Select harness with care. See that it is well made. Make sure especially that the reins, breeching, holdback straps, tugs or traces, belly bands and yoke straps are sufficiently heavy and strong for the work required. A runaway team cannot be controlled with weak reins, nor will weak tugs and straps stand heavy work.

No portion of the harness should show cracks on the grain side when the leather is sharply bent. New leather that does this is worthless for harness or belts, and old harness or belts showing cracks are deteriorating and will soon fail if subjected to heavy loads. Since strong acids prove injurious to harness leather in time, it is to the purchaser's best interest to buy harness which does not contain such materials. Grease in moderate quantities, up to 20 per cent, protects, preserves and strengthens harness leathers. More than 25 per cent is not necessary.

Neglect of harness results in injury that greatly lessens its durability. The sewing, which should have been done with strong waxed linen thread, must be kept in good condition. All buckles should remain solidly in place. It is advisable to wash and oil harness frequently.

For washing, use tepid water, a neutral soap, such as castile or white toilet soap, and a sponge or fairly stiff brush. Hardened grease is very conveniently removed by scraping with a dull knife. Rinse in clean, tepid water and allow the harness to hang in a warm place until it is no longer wet, but still damp. Then oil it and leave it in a warm place for 24 hours before being used. Harness should be oiled or greased while still damp, otherwise it may take up so much grease that it will pull out of shape or take up sand and grit, which will injure it as well as spoil its appearance. Harness should never look or feel greasy.

Neatsfoot or castor oil or a mixture of these with wool grease is good for driving harness. For heavy harness use a mixture of tallow and cod oil, or neatsfoot oil and tallow, or a mixture of any or all of these with wool grease to make a paste having about the consistency of butter. Apply the grease lightly to driving harness and liberally to work harness. Rub the oil or grease, warm to the hand, thoroughly into the leather while it is still damp from the washing. After the harness has hung in a warm room over night, remove with a clean, dry cloth the excess of oil which the leather is unable to take up.

In case the oils and greases mentioned are too expensive or too difficult to obtain, they may be mixed with not more than an equal quantity of heavy mineral oil, petrolatum or paraffin, or a mixture of these substances. In no case, however, should any grease or other preparation containing mineral acids or oxalic acid be used on harness or belts. No matter how highly such preparations may be recommended, avoid them. Their use will hasten the rotting of the leather.

WHERE HORSES COME FROM

Ninety per cent of the 25,000,000 horses and mules in the United tSates are on farms, and only about ten per cent are in cities, towns, villages and other non-agricultural work, according to advance figures of the 1920 census.

It is natural that the ten central states of the great corn belt, Ohio, Indiana, Illinois, Iowa, Missouri, Kansas, Oklahoma, Nebraska and the two Dakotas, where coarse grains are raised in plenty, should be the great reservoir of horse and mule production, rearing approximately three-fifths of all the horses and mules in the country.

The farmers of this section producing horses and mules supply their own needs, furnish work stock for adjoining farms where horses and mules are not reared, also the heavy drafters, wagon horses and expressers wanted in cities, towns and villages, and the farm chunks for eastern states where horse and mule production is not so common.

Pennsylvania and the states east and north do not produce one-fourth of the work animals they use and are constantly drawing on the central west for their work stock. Many of these are farm chunks sold directly to eastern farms, while others are horses produced and worked on the farms of the Mississippi valley until five or six years old, then passed to eastern cities, where, after six or eight years of service, they are re-sold as sore-footed, city worn horses to dealers who sell them at a very nominal figure to farming sections of New England to work the balance of their days. Such horses represent a complete cycle from farms to cities and back to farms again. It is more true now than in the past that the good horse or mule pays a profit to the producer, the dealer and ultimate user, while the poor one loses money to all concerned.

KNOW YOUR COW

If it were possible to limit the number of requisites of success in dairydom to one, that one would be "Know your cows," says Thomas M. Olson, instructor in dairy husbandry at South Dakota state college. Heavy feeding, or feeding a balanced ration does not assure success, although it will increase somewhat the production of the dairy herd. Pure bred dairy cows do not guarantee success, not even pure bred cows from high producing ancestry. Expensive dairy barns and equipment will probably make dairying more interesting, and increase somewhat the total production, but it is not a requisite for success. Many great dairy cows have been developed and have produced wonderful records in barns that would not measure up to the standard so far as up-to-date dairy barns go.

No dairy cow has ever produced her maximum unless her feeder knew her. Knowing her means more than simply calling her by name and reciting the names of her ancestors. It means understanding her every need, desire, and condition. For after all, the dairy cow is an individual, and as such possesses individuality.

It seems well nigh unbelievable that dairymen will continue groping in the dark on this all-important matter, when by means of a pair of scales, a Babcock testing outfit and a little work, every dairyman could know what each cow in his herd produced, and thus have a sound basis on which to feed and judge the individual merits of each cow in his herd.

Thomas L. Matkins of Salt Lake City and Ross B. Matkins of Madera have established a new herd of Herefords in Madera County with 160 head of registered cattle from the Matkins herd of Idaho.

Look About You

and note how many successful Holstein breeders and dairymen have at the head of their herds sons of King Mead of Riverside, Prince Gelsche Walker, and Segis Pontiac De Kol Burke, or bulls out of daughters of these sires.

Every one of these bulls has had one or more world record daughters, but it is not alone because of a few spectacular individual records that their blood has gained so high a place in the records of the breed.

PRINCE RIVERSIDE WALKER

A sire that carries the nick of breeding that has produced an outstanding group of individuals and producers.
His sire, PRINCE GELSCHE WALKER, has a list of daughters and sons almost too well known in California to require description here. His best known daughter is the great Miss Valley Mead De Kol Walker, around which is being built a large and important breeding group in a number of high class herds.
His dam, AAGGIE ACME OF RIVERSIDE, may well be regarded as one of the great producers and reproducers of the breed. With a production of 1054 lbs. butter in one year at 11 years of age, and a former record of 808 lbs. in year, she ranks as one of the foremost cows for two year production. She is the dam of Aaggie Acme of Riverside 2nd, whose production of 1331.78 lbs. butter in one year is the world's strictly official record. She also produced over 2000 lbs. butter in two years, and is in turn the dam of Miss Aaggie Acme Burke, the heifer that made 1034.66 lbs. butter from 24338.9 lbs. milk in one year as a first calf junior 2 year old, and this year as a junior 4 year old made 35.78 lbs. butter from 726.4 lbs. milk in 7 days. She in turn is the dam of the $41,000.00 bull King Korndyke Pontiac Acme.
The transmitting quality of the blood behind PRINCE RIVERSIDE WALKER is abundantly proven on both sides and his sons and daughters may be expected to continue to hand down production.
The first daughter of PRINCE RIVERSIDE WALKER to finish a yearly record, Blanche Nudine Clothilde Walker, has made 865.4 lbs. butter from 21,786.3 lbs. milk in 365 days as a junior 2 year old, the highest butter record for age in California excepting one, the record of Miss Aaggie Acme Burke.
PRINCE RIVERSIDE WALKER has a beautiful group of daughters and is owned by

W. J. HIGDON
TULARE, CAL.

The past, present, and ever increasing popularity of these families and the blending of their blood is based more largely upon the consistent way in which large numbers of their family groups have made large records not only for one year but for two or more years, until their worth as producers and reproducers has a standard value.

This breeding has been the foundation of success with many breeders in California already, and other breeders are now building firmly and soundly upon the same foundation.

Perhaps your own herd can be strengthened by an infusion of this blood through a bull of this breeding at its head, and the popularity of these blood lines has a definite dollars and cents value that is well worth considering.

We are having an unusually heavy demand for bulls, and whether you want a high class sire to head a registered herd, or a bull of known quality to improve your herd of grade dairy cows, it would be well to get in touch with us promptly. Your letter will receive prompt attention, and your visit to our herd is invited.

A. W. Morris & Sons Corporation
Woodland, California

55 Registered Guernseys 55

AT PUBLIC AUCTION

Hollow Hill Farm, Colton, Cal.

Thursday, April 28, 1921

Mr. G. W. Wilder, President of Butterick Publishing Company, New York, has instructed us to make a complete dispersal of the top notch herd of registered Guernseys on his Hollow Hill Farm, Colton, Calif., as he finds himself unable to spend as much time in California as he contemplated at the time Hollow Hill Farm was developed and the herd established.

The production records of this herd stand high in the records of the breed, and the blood lines represent some of the most famous and popular families.

The wonderful show ring record of the herd amply illustrates the high degree of type that is present throughout the herd.

The female offering includes imported and American bred cows, bred heifers, and a very choice lot of open heifers, some nearly ready to breed.

The bull list is unusually attractive, including a number of young bulls, some of service age, that are of real herd heading caliber, rated on pedigree and individuality both.

This herd has been operated under the requirements of a certified dairy and is entirely clean, only one reactor to the tuberculin test having been found during the five years the herd has been tested by a deputy state veterinarian.

Every animal over six months old is tuberculin tested and sold subject to retest by the buyer; every animal guaranteed to be a breeder.

Catalog free on request. Write for one now.

DISPERSAL SALE

135 Federal Tested Registered Holsteins

Toyon Farm Association

LOS ALTOS, CAL.

April 20-21, 1921

This offering consists of 115 young females and 20 bulls.

There is a wonderful quality of breeding present, including many daughters of Sir Pietertje Ormsby Mercedes 43d, Sir Pietertje Ormsby Canary, Sir Aaggie Mead, Sir Korndyke Ormsby Piebe, Sir Bessie Fobes Tritomia, Mutual Fobes Longfield De Kol, Sir Ormsby Burke Segis, and others of corresponding worth. THE BRED FEMALES are mostly in calf to Sir Pietertje Ormsby Mercedes 43rd, Sir Pietertje Ormsby Canary, and Sir Aaggie Mead.

SIR AAGGIE MEAD is in the sale. He is one of the greatest young sires ever led into a sale ring in the West. Sired by Sir Aaggie De Kol Acme, and out of Aralia De Kol Mead who made a strictly official record of 1215 lbs. butter in one year, he combines blood lines of the highest worth and popularity. He is a high class individual and his first calves are very satisfactory.

DAIRYMEN, by all means attend this sale if you are in need of a young bull. There are 20 to select from and they are good ones.

BREEDERS, besides Sir Aaggie Mead there are a number of young bulls in this offering that are the sort to head purebred herds, representing lines of breeding not available in the west except in this sale.

Everything over six months old tuberculin tested by Federal Veterinarian and individual certificates furnished; every animal guaranteed to be a breeder.

BURR FARM

Box 220, Route 2. East 26th and Downey Road, Los Angeles

Cost of Milk Production Formula

The dairy section of the Michigan experiment station has made an extensive study of the cost of milk production covering a period of nine years. Investigations have been carried on on 225 farms, representing 3,730 cows. The milk produced on these farms was either for city trade or condensing purposes.

A summary of these investigations is presented in the following formula, which gives the number of pounds of feed and the number of hours of labor as well as the percentage of overhead costs in terms of feed and labor cost required to produce 100 pounds of milk.

A FEED AND LABOR FORMULA FOR FIGURING THE AVERAGE YEARLY COST OF PRODUCING 100 POUNDS OF MILK

FEED	Amount	Price	Cost
Home grown grains	11.0 lb.	@ $	$
Commercial feeds	15.6 lb.		
Hay	31.1 lb.		
Other dry roughage	15.9 lb.		
Silage (corn)	114.5 lb.		
Other succulent feed	7.0 lb.		
Bedding	12.8 lb.		
Pasture	.3 wk.		
LABOR			
			$
Manual labor	2.23 hr.		$
Horse labor	.10 hr.		
Transportation: Hauling milk			
			$
OTHER COSTS			
1. Taxes, interest, insurance and depreciation on buildings, cattle and equipment			
2. Losses due to death	24.77% of feed		
3. Veterinary service and drugs	and labor costs.		
4. Bull costs			
5. Miscellaneous costs			
6. For management and risks			
			$
Net cost of producing 100 pounds of milk			$

In figuring the above such credits as manure and calves have been deducted from the overhead percentage factors.

To determine the cost of milk production for each month multiply the average yearly cost by the percentage of deviation factors given in the following: January, 112.7; February, 108.6; March, 97.6; April, 100.8; May, 75.8; June, 61.5; July, 85.2; August, 108.3; September, 115.8; October, 115.8; November, 121.9; December, 120.8.

To apply this formula the farmer should use the average price of feed and labor prevailing in his community for a period of time as the amounts of feed and labor represent the amounts required for average yearly production. All prices of home grown feeds should be determined at what the feeds are worth in the farmer's barn, including the cost of any necessary grinding of the grains, while purchased feeds are valued at their actual cost.

Average yearly farm labor prices should be the basis for figuring the cost of man labor. The price of horse labor is based on the cost of maintaining a horse throughout the year; this will range from 15 to 20 cents per hour's work on most farms. The transportation charge may be figured to the shipping station or the receiving plant. All the other costs are based on the percentage of feed and labor costs. In order to determine the cost of 100 pounds of milk, first determine the feed and labor costs, then multiply the results by .2477, which will give the overhead cost. The sum of feed, labor and overhead costs is the cost of production.

To determine the monthly costs multiply the yearly cost by the percentage of deviation factor for the particular month desired.

Why Keep the Other Eight Head?

By Frank D. Tomson

Some months ago the well known auctioneer, H. S. Duncan, was approached by a western Iowa farmer with the query, "What can you get me several registered Shorthorn cows for, just ordinary cows, no fancy breeding, but fair individuals?" He stated that he operated a small farm and was then keeping 12 head of grade cows, but thought of putting in a few full bloods and working the grades off finally.

Col. Duncan asked what price he had been receiving for his calves from the 12 grade cows and at what ages he had been turning them. The farmer indicated $50 as about the price he had been able to get at around 12 to 15 months of age. "They are good stuff and now that the prices are running pretty strong, I can figure on that much," was the rather confident assertion of the farmer. Then he asked again what the registered cows would cost. "You understand I can grade cows and probably a little get around a hundred dollars for these more," he added.

Col. Duncan replied that such cows as he had indicated would cost around $300 per head at the plane of prices at that time. "Well, what would the calves bring then Maybe I had better keep my grades," was the farmer's comment.

"The calves at the ages you sell your grade calves, and this is about the best age to market them, would bring $150 per head."

The farmer did a little mental figuring and then said, "Why, according to that, I would be getting as much for the four calves from the full blood cows as I get for all of the 12 from the grades."

"Yes, that's what you could do."

"But, let's see now, you say these cows will cost $300 apiece. That would be $1,200 for four. My 12 grade cows would sell for $1,200, so I would be paying as much for the four registered cows as all of my grades would bring."

"That is correct," was the response, "and you just stated that the four registered calves would bring as much, using my figures as a basis, and they are conservative, as your 12 grade calves."

"By George, I had almost overlooked that," said the farmer, "and now I'm wondering what I've been keeping these other eight head for, with the cost of feed where it is."

This is about the nub of the whole business. It is a matter of money going out and money coming in. The proportions referred to in this conversation will apply generally. If the prices go up they hold good. If they go down, the ratio still stands.

The food consumption per head will run practically the same with the grades as with the pure breds. The space required per head will be the same in either case. When the totals are all footed up, the advantage is all with the pure breds. It is a farmer's

problem, one that is easy of solution. The business of growing pure bred Shorthorns is quite as simple as that of growing grades. There is the charge of $1.25 for recording each individual, and the keeping of the pedigree. That's all, both small items. Any farmer who can fix the pump or drive a team can look after these items. There is nothing complicated about it.

This matter of the cost of keeping a cow has been causing a good deal of study for a dozen years past. Just now it is the real issue on any stock farm. It has only one solution and that is, the kind that will pay for their keep and make a profit besides.

"Why keep the other eight head?" is the question to be answered.

DAUGHTERS OF PURE BREDS GAIN OVER DAMS

To acquaint livestock owners with the benefits resulting from the use of pure bred sires the bureau of animal industry, United States department of agriculture, has prepared a collection of specific facts and figures. The following incidents have just been made public:

An inferior dairy bull, Brown Bessie's Register, not only failed to increase the milk and butterfat production of his daughters but actually lowered them.

The first five of his daughters to freshen produced in a year 2,140 pounds less of milk and 87 pounds less of butterfat than their dams.

Compared to this record is the report on three daughters of Sultana's Virginia Lad, a good pure bred bull. When these heifers freshened they gave the following average yearly production as two year olds: Milk, pounds, 9,676, butterfat, pounds, 519, while their dams averaged 4,992 pounds milk and 269 pounds butterfat.

Attention is directed to the fact that a bull's influence is equal to that of a herd of 20 cows. In a year's time the cow influences but one offspring, her own calf, whereas the average bull, siring a score of calves, influences each calf.

Calves sired by good pure bred bulls are worth at least one-fourth more than calves of the same age sired by average grade bulls. The increased value of the calves sired by the pure bred bull in one season will nearly balance the difference in purchase price of a good pure bred bull over a grade.

The value of pure bred beef bulls over the common stock is being conclusively shown by a 30 year demonstration at the Sni-a-Bar Farms.

In 1913 the best of the steers sired by common bulls brought $2.25 per hundredweight, or a total of $24.91 under the top price. Two year old steers of the first cross from these cows sired by good pure bred bulls brought the highest price ever paid at that time of the year in Kansas City. They sold for 40 cents per hundredweight, or a total of $5.22 per head above the top price of bulk shipment.

Recent sheep management cost accounting on Missouri farms brought out the fact that where good pure bred rams were used the net profits averaged 50 per cent more than the net profits from flocks where ordinary grade rams were used.

WOOL MARKET NOTES

A cargo consisting of about 5,000,000 pounds of South American wool was unloaded in Boston, January 20. On the same date two other cargoes totaling approximately 14,000,000 pounds were reported en route to the same port due to arrive within a few days.

The market has shown some improvement during the past week. Some sales have been reported, principally of fine, French combing and clothing grades.

A further indication of the improved tone in the wool market is a marked increase in the number of requests from manufacturers received by the United States bureau of markets asking for names and addresses of wool pools and the amounts of wool held by each.

Colorado.—A large percentage of the 1920 wool clip of the state remains in the hands of producers.

Several associations and wool pools have shipped their holdings to commission firms in Kansas City, Chicago, and eastern points. The wools which remain in the hands of local organizations are being offered for sale at prices ranging up to 50 cents on a flat basis.

California.—Wool growers have organized associations in various sections of the state and plan to market the clip cooperatively.

Louisiana.—A considerable amount of the wool produced in Louisiana remains in the hands of producers. Holdings of certain pools are being offered for sale at 35 cents on a flat basis.

New Mexico.—Much of the wool produced in this state has been consigned to commission houses.

Pennsylvania.—It is reported from Western Pennsylvania that dealers are offering 33½ cents per pound for Delaine wools but no sales have been consummated.

Virginia.—Much of the 1920 wool clip remains in the hands of producers. Farm bureaus and associations of growers are acting as selling agencies for the producers in various sections of the state. The holdings of several pools have been graded in accordance with the United States bureau of markets tentative wool grades.

Why So Widely Used?

There is only one reason why Kow-Kare (formerly called Kow-Kure) is so generally used by dairymen all over the country.

Merit, proven time after time, in treating the ills of milking cows is the one answer.

By assisting the digestive and genital organs to function normally Kow-Kare throws off diseases and is a reliable treatment for Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches.

Buy Kow-Kare in 70c and $1.40 packages from feed dealers, general stores or druggists.

Save 10% to 30% of Your Feed

The saving of feed by cutting it up with an Acme Cutter has been demonstrated by many Pacific Coast Dairymen to be more than enough to pay for the cutter in one season.

It is the habit of stock, whenever given an abundance of feed, to pick out and eat only the finer and more palatable portions; nosing out and wasting weeds, and foxtail and the stemmy part.

This loss ranges from 10% to 30%, the amount depending upon the quality of the hay and the method of feeding.

Chopped Hay, with careful handling, will keep five cows, while the same weight of loose or bulk hay will only keep four. Waste is eliminated by chopping your hay.

Men who dairy on a business basis find that chopped feed is the surest way to utilize to the fullest extent the feed value of the entire hay crop.

The durable steel framed Acme will earn its cost every season chopping hay and at the same time provide you with a Silo Filler of superior cutting ability and an Alfalfa Meal Machine.

A FEW SPECIAL FEATURES OF ACME CONSTRUCTION

All steel triple frame construction.

Center hung blower fitted with six arm blower fan that will not clog.

Big range of pulley sizes permits change in speed of cutter head and blower to suit length of cut and heighth of silo. All gears are well guarded.

Soft steel shear pins through fly wheel and pulley prevent accidents to machine or operator. Reverse lever with gears enclosed in housing. No ratchet to stick at critical moment.

Immediate deliveries.

Don't Buy a Cutter Until You Know All About The Acme

POULTRY

Best Chicks Grow Into Greatest Winter Layers, cost little more, yield greatest profit. Our White, Brown, Buff Leghorns, Andalusians, Anconas, Reds, Rocks, Minorcas, Wyandottes (ducks, turkeys), bred 20 years to lay winters and 180-290 eggs yearly, often clear customers $5.00. "Pullets raised from your chicks averaged 209 eggs last year"; "114 hens cleared $612 in 12 months." "Fourteen pullets laid 300 eggs January, 330 February." "Get more winter eggs from 60 your hens than from 200 formerly;" 140,000 electrically hatched. Half booked, yet nearly every week open for thousands, reasonable. Former customers take half. Don't delay. Write (rarely home) Profitable Poultry, 19 North Fair Oaks, Pasadena.

Baby Chicks — We have the following varieties of Thoroughbred Baby Chicks every week: White Leghorns, Anconas, R. I. Reds, Fancy Dark R. I. Reds and Barred Rocks. We use only well selected eggs from rigidly culled flocks. BY SPECIAL DELIVERY. This year all chicks are sent by Parcel Post Special Delivery, thus delivering at your door chicks in the best possible condition, and in the shortest length of time. You should send for price list and put your orders in now. Orange County Hatchery, Harold C. Hebard, Prop., Santa Ana, California.

S. C. White Leghorn Baby Chicks from heaviest laying (Hoganized) stock. Safe delivery live vigorous chicks guaranteed. No money in advance; pay on delivery. Prices for May and June $5.00 per 25, $9.00 per 50, $14.00 per 100. Special prices 500 and 1000 lots. Largest electric hatchery in the World. Established 1898. MUST HATCH INCUBATOR COMPANY, 438 Seventh Street, Petaluma, California.

Hillview Buff Plymouth Rocks — An American bird for Americans. Splendid layers, fine broilers and fryers, beautiful in color, the ideal for the farm, city lot or show room. Blue ribbon winners 1920 in Oakland, Riverside and San Diego shows. **Eggs for hatching from our best matings** $5.00 per setting of 15, commercial eggs $3.00 per setting. Hillview Poultry Ranch, Chatsworth, California.

Sly's Old Mission Strain Rhode Island Reds. My customers won highest honors at various California shows last season. See testimonials in new catalogue now ready. Six ideal matings. Hatching eggs at reasonable prices. NO BABY CHICKS. A. G. SLY, 1642 (D) Middleton Place, Los Angeles, California.

Baby Chix—S. C. White Leghorns from open range standard bred parent stock of utmost utility. Protect yourself in having your order booked early. Prices, etc., on application. I. X. L. Hatchery, 519 Upham Street, Petaluma, Sonoma County, California.

S. C. White Leghorn Baby Chicks from my carefully selected, pure-bred stock of S. C. White Leghorns. Orders for spring delivery booked now at $15.00 per 100, $140.00 per 1000. Write for particulars. J. R. Heinrich Poultry Yards, Arroyo Grande, California.

Santa Cruz Chicks — White, Brown and Buff Leghorns, Anconas, Minorcas, Barred Rocks, Reds, Buff Orpingtons, White Rocks and White Wyandottes. Write for 1921 folder with price list. B. W. Archibald, Soquel, Santa Cruz County, California.

Baby Chicks — Barred Plymouth Rocks and Rhode Island Reds in 25, 50 and 100 lots 20c each. Hatching eggs $2 per 15. We ship by Parcel Post, pay all charges. Write for circular. Hargett & Son, Route 2, Compton, California.

Eggs from purebred Mammoth Bronze Turkeys, $1.00 each, or $10.00 per 11. Eggs from purebred Buff Orpingtons $3.00 per setting of 15. Incubator lots furnished reasonable. Mrs. M. L. Trewhitt, Route B, Box 47, Hanford, California.

For Sale—All kinds of citrus nursery stock, one and two year buds, fine roots. Y. Yamaguchi, Upland, 10th Street and Cucamonga Avenue. Phone 386-W.

Home Grown Budded Eureka, Placentia and Chase Walnut Trees, 50 cents and up. None better. Choice lemon trees $1.00 each. Balled. Bartlett Pear, etc., 50c each. Trees of all kinds for sale. We deliver. Tel. 122-J, Burbank, California. Opposite High School (West), Burbank, California. Snyder Nurseries.

For Sale—Placentia Perfection and Eureka walnut trees, also orange, lemons, avocado, loquats and the leading varieties of fruit trees, berries, rhubarb, grape vines, etc., ornamentals and a fine assortment of rose bushes. Ketscher's Nursery, 1101 E 4th Street., Santa Ana, California. Phone 572W.

Walnut Trees of dependable varieties and quality grafted on Northern California Black Walnut, carefully selected scions from best bearing trees. Good condition for planting now. Placentia, Perfection and Eureka at Reduced Prices. Los Nietos Valley Nursery, Phone 692, Downey, California.

For Sale — Valencia, Navel, Eureka Lemon, Dancy Tangarine, Rangpur Lime; Supply Company and Tree Performance record buds. One and two years. Cyrus Wilhite Citrus Nurseries, Glendora, California. Phone 303.

For Sale—5000 A-1 Valencia Orange and Eureka Lemons; strong clean yearling buds on sour roots, prices right. Nursery at Montebello. A. R. Thurston, R. F. D. No. 6, Box 895, Los Angeles, California. Phone Boyle 3225.

Cling Peaches, Apricots, Almonds — All varieties and sizes. Concord. Mayette. Franquette Walnuts, Cory Thornless Blackberry; large stock. State your wants and let us quote. Ekstein Nurseries, Modesto, California.

Walnut Trees—Closing out balance Placentia and Eureka grafted on black root; choice trees; reduced prices. Terms to responsible parties. Nurseries Ventura and Los Angeles Counties. R. E. PIERCE & A. G. SNOW, Oxnard, California.

Budded Avocado Trees. Leading varieties. Order early to secure best selection. Dr. Stonebrook's Avocado Nursery, 15 N. Raymond Ave., Pasadena. Phone Colorado 208.

5,000 Valencias; 2,000 Eureka lemons; 3,000 Mission olives; 100,000 Florida Sour orange seed-bed trees; 50,000 Sweet orange seed-bed trees. SOUTHLAND NURSERIES, 1941 E. Colorado St., Pasadena. Phone Colo. 6352.

We Have Deciduous and Citrus Trees, berry plants, tomato plants and garden seeds. California Wonder Corn and Elephant Grass are big producers. Send for Catalog. Bishop's Nursery, Highland.

For Sale — 10,000 Florida Sour Orange Seedlings, very fine. Two year old Valencia Orange and Eureka Lemon Trees. W. V. Skillman, R. F. D. Box 387, San Fernando, California.

Florida Sour Seed-Bed Trees, six to twelve inches high. Straight roots. Stocky trees. Highest quality. L. A. Tuttle Nurseries, Route 1, Pasadena.

Avocado Trees—Get your orders in now. Mathers Avocado Nursery, Ventura and Rose Streets, Pasadena, P. O. Box 585. Phone Colorado 6044.

For Sale—Three thousand Phillips cling peaches; also a few Tuscans. Special prices to clean up. Burke's Nursery, Lodi, California.

Florida Sour Seed bed stock. Paul B. Magee, 100 Ventura St., R. F. D. 2, Box 499, Pasadena, California.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

California Sweet Seed Bed Stock, 6 inches and upwards. Kloeckner & Lee, 51 N. Chester, Pasadena, California.

For Sale — Sacks and burlap for balling trees. J. Ross, 313 N. Boyle Avenue, Los Angeles. Telephone Boyle 1800.

TURKEYS

Turkeys — "Goldbank Boy." Champion Giant Bronze young tom. First Prize Cockerel at the New York, Madison Square Garden Show, the premier show of America, with 4311 poultry exhibits, held January 18th to 22nd, 1921, has just been imported by us, arriving at our mountain ranch February 26th. His sire, "Goldbank VIII," was grand champion at the same show, winning first in Cock class. We have mated this young champion bird to a limited number of twenty and twenty-one pound fancy, highly colored, eastern bred hens, also just imported. No eggs of this strain for sale this season at present.
A thirty-six pound yearling son of "Copper King V," the famous thirty-eight pound yearling giant bronze grand champion of the 1919 Madison Square Garden Show, will head our other flock—having mated him to our choice twenty pound hens. Egg prices reasonable. Two young toms of this last strain on hand for immediate delivery. For further particulars address: Bronze King Mountain Farm, Box 308, Calistoga, Napa County, California.

Several Varieties — Mammoth Bronze, Bourbon Red, White Holland turkey eggs, $6.00 dozen; choice prize stock. White Guinea eggs $2.50 setting. Houdan $2.00 setting. Chicks to order 20c. White Muscovy (quackless) duck eggs $1.50 dozen. Grand turkey gobblers for service $2.00 per hen. One mating fertilizes one whole clutch of eggs. Parcel post 25c. B. Hocking, 541 E. 33rd, Los Angeles, California.

Bourbon Red Turkeys, Buff Ducks, Buff Orpingtons. The Ferris Ranch, Reservoir St., Pomona, California.

TURKEYS

Large Number of Choice Bronze Toms and hens, also geese and herding Collie Dogs. Shipped from St. Helena and San Miguel. John G. Mee, San Miguel.

"Goldbank" Strain — Giant Bronze turkey toms. Partridge Plymouth Rock chickens. Chicken and turkey eggs in season. M. M. Reiman, Planada, California.

Turkey Eggs—Mammoth Bronze — Write for folder. Guarantee stock built up by 5 years of untiring effort. Andrews & Andrews, "Bo-K-Haunt" Hemet, Calif.

For Sale—White Hollands, Quality, Size and Vigor. Tom $15, eggs 50c each. Blue ribbon flock header. L. A. Robinson, Hemet, California.

Mammoth Bronze Turkey Toms — Have two good cockerels to sell. Mrs. C. W. Keys, El Monte, California.

FARM LEASE CONTRACT

One of the most perplexing things is the arrangement of the terms and the writing of a contract for lease of farm. Every individual farm calls for study of its conditions and perhaps different percentage of crop or rental consideration. Study has been given to these subjects by L. C. Gray and Howard A. Turner of the department of agriculture and they have given this information in Farmers Bulletin 1164. They summarize their findings in the following:

Was its full meaning understood before it was signed?

Is it so written that its meaning will be clear at any later time?

Is it fair to both parties?

Does it give the tenant a reasonable opportunity to make a comfortable living and to get ahead?

Does it require proper and conservative care of the premises leased?

Are all desired reservations to the lease made?

Are the things stated which each party is to do and to contribute?

Does it make clear the rights and privileges of each party?

Does it define the relationship between landlord and tenant and provide for the settlement of differences of opinion?

Does it contain a statement of the procedure to be followed when the relationship of landlord and tenant is to be terminated?

Does it contain the following essentials to a legally complete lease?

1. The date it was made.
2. The names and the final signatures of the contracting parties.
3. The period for which the lease is to run.
4. A description of the property leased.
5. An agreement in respect to the amount of rent to be paid and the time when and the place where it is to be paid.

SOILS AND AGRICULTURE OF SOUTHERN STATES

"The Soils and Agriculture of the Southern States," by Hugh H. Bennett of the bureau of soils of the United States department of agriculture, published by Macmillan Co., New York.

This book is true to name in that it touches soil conditions in the southern states or section we often refer to as "The South." The soils of the Southwest do not come in for discussion. However, the preface announces: "The writer trusts this volume will be looked upon as Volume I of a series of books which it is hoped will be written to cover the soils of all sections of the United States and their relation to agriculture. At the present time much attention is being directed toward the Southern States on account of extensive areas of unused potential agricultural lands to be found there, and for this and for other reasons, particularly because of the need for more definite knowledge of the soils of the country, it is considered appropriate to present this volume at this time." Where one wishes to keep thoroughly in touch with soil conditions the country over this book will make excellent foundation for the fuller information which will come later. It is thoroughly up-to-date and has a most complete index covering nearly 30 double column pages of fine type. There are 400 pages, illustrated and with many charts showing soil conditions in various portions of the country.

A Real Tractor Scraper

Most complete success was not had at first with tractors because of lack of adapted tools and implements. This situation is gradually changing, however, and today a special article for nearly every kind of work is provided. One of the latest of these is a tractor scraper manufactured by the Miskin Scraper Works, Ucon, Idaho. It is so arranged that the wheels carry the greatest portion of the load whether loaded or empty. It is provided with lever at the side of the tractor driver's seat which makes it easy to dump and spread with a rope. No stopping or backing up is required. We believe the same concern also puts out a fine line of horse drawn scrapers.

"It Won't Take Long"

"We'll finish today, John. I tell you this Hercules Farm Dynamite is great stuff for speeding up tree planting. And say—how these trees do grow. They show that they like holes blasted with

HERCULES
FARM DYNAMITE

"Let me give you a tip. Send for the Hercules Powder Co.'s 68-page book 'Progressive Cultivation'. You need this book for it tells you all about the use of explosives on the ranch and in the orchard—how to plant trees, cultivate bearing orchards, dig ditches, clear land and do many things with the help of Hercules Farm Dynamite."

Send in the attached coupon *today*—and this book will be mailed to you free of charge.

Hercules Dynamite is for sale by leading Hardware and Implement Dealers

Combining to Fight the Grasshopper

THERE is nothing so good as poisoned bran for taking the hop out of a grasshopper, and there is no better way of buying and distributing the bran than through a community organization. In the areas where the grasshoppers come down on the farm crops like all the plagues of Egypt there should be grasshopper fighting organizations, just as there are fire fighting units in every city. Fighting a grasshopper invasion without the help of one's neighbors is like trying to put out a fire in a powder factory with one bucket of water.

In the Pacific states the vast uncultivated areas of mountains, foothills and grass lands afford ideal breeding grounds for at least eight common species of grasshoppers. There seems little hope of destroying the grasshoppers in these isolated breeding areas, and for that reason specialists of the bureau of entomology maintain that it will be many years before the grasshopper menace disappears from the West. But while they cannot be exterminated at their source, they can be met with a systematic, well directed barrage of poisoned bait, fire and other weapons for control when they attempt to invade the cultivated fields.

All preparations should be made early in the spring before the insects have left their breeding grounds. The organization should be directed and controlled by efficient and energetic leaders, and it ought to have the cooperation and support of every farmer in the community as well as the landowners who hold title to the remote areas from which the plague spreads.

An equitable method of raising funds for the work can be arranged if every landholder is taxed on the basis of the acreage he holds or operates. The funds should be collected and placed at the disposal of a good business man who will know how and where to go about buying poisons and other supplies when they are needed, without the necessity of untangling red tape. Sometimes it is advantageous to fight the grasshopper army with fire, and it is often necessary to spread poisoned bait upon the property of nonresident landowners. Here are two points where legal advice is desirable, and the leaders should know their exact rights and limits in these matters before the time comes for them to act to save the crops of the community.

If the district is divided into defense areas and each area put under the supervision of a man who knows grasshopper habits and how to use the weapons which the organization has put in his hands there will be no waste of materials or effort when the foothills disgorge their hungry hordes. Lastly, the wider the cooperation the better the results will be. It does no good to drive the hoppers from one district if they are allowed to settle and feed upon another—passing the pest along to the other fellow does not afford permanent relief, and it puts an extra hardship upon one's neighbor. The assault should be simultaneous throughout the whole infested area.

Comb Honey Production

By G. W. Bercaw

It takes an expert to produce fine comb honey. Southern California produces only a very limited amount. Variable temperatures, elevations, etc., are the prime influencing factors. The night season is generally too cold, and, observation has led me to believe that a large part of the work of bees, storing, evaporating, curing, sealing, or capping, is done at night. It is a difficult matter to use a single story hive through the winter season and tier up with comb honey supers in the spring. While this method will work to a certain degree it will not produce enough to warrant its following on an extensive scale. First of all, there must be a hive full of bees, in fact overflowing, and as little swarming as possible. Now to get these conditions, what must be done?

First, follow the procedure outlined for producing extracted. When the season's flow is over and bees are presumed to be put into winter quarters (in California), use two-story hives, arranging them all without queen excluders between stories, allowing them to remain this way until late the following spring, with queens in both stories. At the opportune time in early spring go through each colony, getting rid of all drone comb that you can, the idea being to put each two-story colony into one, at a time when the most bees can be utilized. If you desire to use all the bees and brood in second story, put an excluder between the stories for about 21 days, shaking all bees in at entrance. Be sure the queen is below. Then when this 21 day period has expired there will be no brood upstairs, but there will be honey and bees. Remove the second full winter story and substitute comb honey super or supers, shaking all bees at entrance, using combs elsewhere. If you have an extracting yard, use them there.

The exact time of such procedure will have to be decided by the apiarist in charge, as sometimes our seasons are early, and again late. At all events get the bees in the comb honey supers when the flow is on. Single tier supers are generally used in this state, although full depth, wide frames, with section boxes therein could be used, we think, though we have never experimented with the wide frames in California. Tiering up the supers will have to be decided on the judgment of the one in charge and will depend mostly upon the strength of colony and the honey flow in the fields, giving sufficient room at all times. The use of honey boards, with bee escapes therein, is almost a necessity for the rapid manipulation of comb honey, in the evening, putting them under such as are to be taken away, and by morning it will generally be clear of bees above the board.

Our equipment in comb honey yards has always been the standard eight-frame hive, full depth Langstroth or Hoffman frames. To conserve the heat and retain good temperatures we have always used 10-ounce canvas mats directly on the comb honey supers. The bees will seal it down, usually airtight. Size of section boxes used is the standard 4¼ by 4¼ by 1⅞ also 1½ wide; one-half depth supers, with followers and springs, not wedges, these of eight-frame size to fit hive bodies properly. The use of comb foundation as starters in section boxes is absolutely necessary, amount, shape, weight, etc., being a matter of choice largely. Our experience indicates that foundation cut in a triangular shape, with the point about the center of the section box, answers in full all the requirements.

Our general averages run during good season about four full supers per colony in yard of 100 stands. Reduce the swarming fever as much as possible is the best rule.

PHOSPHATE ROCK IN 1920

The notable feature of the phosphate rock industry in 1920, according to the United States geological survey, was the increase in production in the Western states. The shipments from mines in Idaho ran from 2,000 to 3,500 tons a month in the early part of the year, but were more than 8,000 tons in a single month after midsummer. About 20,000 tons was shipped before July, more than in any previous entire year. The total output of the Western states in 1920 is estimated at 65,000 tons, in comparison with 17,000 tons in 1919.

Early in the year reports were published that a contract had been made for large shipments of Idaho phosphate rock to Japan. Several hundred tons were shipped from the Idaho field to Yokohama in March, May and June, but regular shipments were not continued. A large part of the Idaho output was sent to points on San Francisco Bay, and a few shipments were

sent to Anaconda, Montana, for conversion into acid phosphate at the new fertilizer plant of the Anaconda Copper Mining Company, built in connection with its smelter.

Shortage in the supply of freight cars hampered the industry in Tennessee, but the production of the old and some of the new companies was probably considerably greater than in 1919.

Operations on Florida phosphate were pushed throughout the year and the push made up in part for the loss caused by the long strike in 1919. The shipments from the pebble field were probably more than 2,000,000 tons, and it is estimated that the total shipments from the state were as great as those in the peak year, 1913, and may even have surpassed them. The demand for phosphate for exportation was good, and many shipments were made to northern Europe.

Total production of phosphate rock in the United States in 1920 was about 3,265,000 long tons, as compared with 2,249,000 tons in 1919.

Phosphate lands in the Western states that have been withdrawn from entry for several years are now open for leases and permits, which will be issued by the general land office. The minimum royalty is two per cent of the gross value of the output, and a rental of 25 cents an acre will be charged for the first year, 50 cents an acre for each year from the second through the fifth year, and $1 an acre annually thereafter. No lease will be given for more than 2,560 acres.

VALUE OF SORGHUMS

"Grain Sorghums and How to Grow Them" is the title of Bulletin 1137. Its title gives a good idea of its contents, which, however, is summed up in the following short paragraphs:

The grain sorghum crop increased from approximately 2,000,000 acres in 1903 to 5,000,000 acres in 1919. The average acre yield varies from about 12 bushels in poor seasons to more than twice that quantity in favorable seasons.

The more important grain sorghums are included in two groups of varieties, the kafir group and the milo-durra group. Dwarf and early varieties in both groups are best for the higher and dryer districts. The use of good seed of adapted varieties, a well prepared seed bed, clean cultivation, and the right method of handling after harvest will increase the yield and quality of the grain.

The milos and feterita ripen in 90 to 110 days, which adapts them to short seasons, high elevations and low rainfall. The kafirs are not so early and require more moisture. They do best when the rainfall is about 25 inches and the elevation ranges up to about 2,000 or 2,500 feet.

Pure seed is important. Select the seed heads from the standing stalks before the crop is harvested, so the best plants may be found.

These crops will grow on moist soil types. It pays to delay sowing until the soil is warm. Cold soil injures germination and delays growth.

From two to three pounds of good, clean seed are required to sow an acre. On the average, ten to 12 inches of row space to the plant in rows 3½ feet apart is best for the milos and feterita and 14 to 16 inches for the kafirs.

Clean cultivation is essential for best results. Kill the weeds and keep the surface soil loose. Harvest the crop when it is ripe. Dry or cure the heads properly before thrashing and adjust the thrasher so that the grain will not be cracked. The grain should be clean and dry before it is stored in bulk; otherwise it will get out of condition quickly. While in storage it should be watched for signs of heating.

CRANBERRIES FROM FINLAND

Having noted in a United States commerce report that Finland exported to this country during eight months of last year more than 500,000 pounds of "lingon" berries the Cultivator wrote Leslie A Davis, American consul at Helsingfors, Finland, and received the following reply:

"The botanical name of the plant is Vaccinium vito idaea. 'Lingon' is the Swedish name for it and the English equivalent of this is given in the dictionaries as 'cowberry.' 'mountain cranberry' and 'red whortleberry.' The lingon berry grows wild almost everywhere in Finland but has never been cultivated. It resembles the cranberry but is only about half as large and is not so sour. The plant grows only a few inches high. The berry is considered almost indispensable in Finnish housekeeping and especially good for the sick. It is used for soups, porridge, jams, flavoring, juices, marmalades, wines, etc."

MOUNTAIN LILACS

Just at present the ceanothus are in bloom, known to many by the name of mountain lilac. While they come in but two colors, blue and white, there are many shades of these. It seems odd to speak of shades of white, but the color of the large floral organs in some species so modifies the white of the petals that the general effect is varying shades of gray. In the blues the shades run from a slight tinting of white petals down to a pure deep blue. The foliage and habit also vary much so that in the group of a dozen species one may get ample relief from monotony in massing the many together. Nearly all the better species may be obtained from plant dealers, one firm listing eight species.

Manager Stanley of the Poultry Producers of Central California reports:

New York reports receipts of 57,734 cases of eggs, largest for season, which is earlier than for years, and lowest quotations this season ranging for whites from 30 to 40 cents. It is hoped bottom is reached. Los Angeles is now shipping none to Eastern market but is storing.

POULTRY

Price to producers: Hens, lt., 35; heavy 35; colored, 38; broiler, 40@48; roasters, 40; old roosters, 15; fryers, 55; ducks, old 23; ducklings, Pekin, 3½ up, 35; others, 35; geese, 25; turkeys, live, young tom, 50; dr., 55; old, live, 40; dr., 41; hens, live, 50; dr., 54; squabs, 45@47.

Belgian hares, live, 14@19; old, 9.

LIVESTOCK

Los Angeles, March 22. — Weighed and delivered off cars without food or water:

Hogs, (hard grain). 125 to 175 lbs., 11.50; 175 to 225 lbs., 12.00.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock March 22, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies liberal, market firm. Stocktons: Burbanks, quality poor, 1.75 @1.85; few best 2.00@2.25. Idaho: Russets, mostly 2.00@2.25. Sweet potatoes: Supplies moderate, market steady. Best mostly 2.00@2.25 lug. Arkansas and Texas, 7@7½ lb.

Onions: Supplies heavy, market dull. Stocktons: White Globes, cold storage stock, 1.00@1.25; Browns, mostly 50@75 per cwt. sacked.

Garlic: Local best mostly 12@15 lb.; poorer 8@10.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock March 22, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Best doz., 75@1.50; mostly 1.00@1.25.

Asparagus: Supplies increasing, market weak. Imperial Valley, 15@20 lb.; local 25@30; Northern quality poor, 12½ @15 lb.

Beets: Doz., 30@40; sk., 1.75@2.00.

Cabbage: Field cr. best mostly 75@ 85; poorer 50; best 1.00.

Carrots: Doz., 30@35; sk., 1.00@1.25.

Cauliflower: Supply moderate, field cr., best, 1.75@2.25; poorer, low as 1.00; few best high as 2.50@3.00.

Celery: Field cr., 3.25@3.75; poorer, 2.50@3.00.

Cucumber: Hothouse, best, 2.00@2.50 dozen.

Lettuce: Local field cr. mostly 75@1.25; best mostly 1.40@1.50.

Peas: Supplies liberal, market firm. Imperial Valley, quality good, 10@11 per lb.; poorer, 6. Local, best 8@10 lb.; jobbing, 9@10.

Radishes: 15@17½ doz.

Rhubarb: Crimson Winter, best bx., 1.25@1.50.

Spinach: Doz., 15@20.

Squash: Summer, 2.25 cr.; Italian bx., 2.65@2.75.

Tomatoes: Mexican, per lug, original 3.00; repacked lug, 3.50@3.75. Much poor stock at wide range in prices.

Turnips: Per doz., 25@30; sk., 90@1.10.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.00@2.25; special packed brands, 2.75@3.25; Imperial box, 4.75@5.25; small sizes, 4.25@4.50.

Lemons: Market dull, wide range in prices: Local stock: Packed, box, 1.50 @2.25, few high as 2.75; loose, bx., 75@ 1.00; lug mostly 40@50.

Oranges: Supplies heavy, market dull. Navels market pack large size 2.75@ 3.25; small low as 1.75; special brands small sizes 2.75@3.25 large 4.00@4.25; packing house culls, 25@85 box; few large size 1.00. Tangerines, best, 6@7 lb., small, 4.

HONEY

Shipping Point Information, U. S. Bureau of Markets. Southern California: (First part of March). Practically no wire inquiry. Supplies heavy. Demand and movement slow, market weak. Few sales being made in 60-lb. cans. Carloads f. o. b. usual terms: White Orange and White Sage 12@13½; White Alfalfa, 8@9; Light Amber Alfalfa, 6@6¾. Hawaiian, White 7½; Light Amber 6. Due to unsettled market conditions, a large proportion of shipments are consigned to Eastern markets to be sold by packers in less than carlots. Bulk honey is moving a little more freely. Practically no export demand is reported. The heavy recent rains are said to insure a large crop this season. Many producers are still holding last year's crop for higher prices than the present market will pay. Monterey County reports most of the old crop sold, with good prospects of the coming year. San Diego County has some 35 cars still in warehouses. A very high per centage of California honey is now disposed of through cooperative associations. It is reported that contracts of the new crop are being offered for June and July shipment at very low prices. Sacked beeswax of light color is being sold in less than carlots at 33@35 per lb., dark stock being quoted as low as 26.

WALNUTS

California Walnut Growers Association's prices: Soft Shell, No. 1, 22½: Soft Shell, No. 2. 15½; Budded, fancy, 26½; Budded, standard, 22½.

GRAIN AND FEEDS

Grain Exch. price bid March 22:
Milo: Eastern No. 2 bulk, 1.50.
Corn: No. 2 Yellow bulk 1.60.
Barley: Carlots, 1.31¼.

HAY

Alfalfa Growers of California report under date of March 22:

Receipts of alfalfa during the past week lighter. The worst of the present general situation is the feeling of hopelessness created all around by the endless decline in the principal farm products, which just now makes it appear as if there were no bottom to prices. However, the experience is that when such a stage of general despair is reached, prices too have usually almost reached bottom and the change for the better is not very far off. Then, when a steadier market has restored confidence to the point that a further material decline is hardly to be feared after the most severe decline on record, the worst will be over and gradually the tide will turn in favor of producers. The very critical situation of the farming industries of the country, and the resulting demoralizing effect on manufacturing and business is finally being realized by the government to the extent that after last week the secretary of agriculture had issued a statement showing the extreme seriousness of the situation and appealing to every good citizen to do his part in helping the farmer, President Harding this week promised help through legislative measures and Secretary of Commerce Hoover urged action in the way of export credits as the most necessary measure. While we farmers appreciate these good intentions, they so far only give us the moral support of the government, which is of course all right as far as it goes, but what the farmers of the country need is a more substantial tonic, one which will strengthen their bank account and maintain their credit, and they are so exhausted that they need this tonic quickly in order to enable them to recover. We therefore are more impressed with Secretary Hoover's measures, as giving quick temporary relief, than with the legislative measures promised by President Harding, which are all right when they come, but which may come too late.

There were 280 tons received on the Los Angeles tracks the week ending March 19, with 80 tons held over, as against 560 tons received the week before.

Rabbit Alfalfa	36.00
No. 1 Dairy	24.00
Standard	21.00

HIDES AND PELTS

The market on hides and skins continues weak and prices unsettled. Tanneries throughout the United States are shut down or running part time, causing light demand for raw stock.

Damaged and extra grubby hides in winter condition will scarcely bring enough to pay freight on them.

The list below will show our estimate of today's values:

No. 1 heavy hides, 60 lbs. up, 3; do, medium, 45 to 60 lbs., 3; do, light, 30 to 45 lbs., 5; do, native bulls, 2; No. 1 center

—the biggest sensation in the vegetable kingdom. This wonderful variety out-yields any yellow dent corn ever grown. Averages two 10 to 15 inch ears to stalk — attains gigantic growth and is thickly covered with broad, succulent leaves. Thrives in any soil.

Learn more about "Big Jim" from Germain's free 1921 catalog. There's a $300 cash prize for the 10 largest ears. Address Dept. B.

Kafir: Eastern, 1.60@1.70.

HAY

Alfalfa Growers of California report under date of March 21:

There were 1,031 tons received in San Francisco.

No. 1 Dairy	19.00
Standard Dairy	17.00

Under date of March 18, A. W. Scott Co. says:

Receipts past week 1,031 tons. Trade has been extremely slow and the market lifeless with stocks and receipts in excess of all requirements. Reports from the interior are everywhere of unusual abundance of grass and most favorable conditions and progress in growing crops. Both of these conditions have a tendency to cause holders to feel like selling before the active spring work commences. Dairy demand both for alfalfa hay and all kinds of dairy feeds has greatly diminished. Reduced prices of butter and the quantity and richness of the pasture has practically caused dairymen to stop feeding for the moment and created a corresponding dullness and lack of demand in the selling markets. It may be some weeks before this trade picks up again as all indications point to an early and open spring. Export and shipping generally has been unusually dull and appears to be influenced by the general market condition.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Tame Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00

Citrus Markets

Los Angeles, March 23, 1921.

Valencias are already going forward, although not in sufficient quantity so that any have appeared in auctions. The whole orange market is in much better condition than formerly and demand has been created for small sizes which are a big factor in this year's production. Present f. o. b. quotations are around 3.75 for 126's, while 250's and 288's are holding close to 1.75@1.90. Something over 7,000 cars Navels remain for shipping during April.

Lemons are slightly better but there are more than twice as many cars in storage as last year this date. About 45 cars will go out by the way of Panama Canal this week.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 11,794 cars; lemons, 2,588; total, 14,382. To same date last season: Oranges, 11,708; lemons, 2,273; total, 13,981. From Central California to date, this season: Oranges, 4,314; lemons, 115; total, 4,429. OREGON PRUNE MARKET

R. C. Paulus, sales manager of the Oregon Growers Cooperative Association, sizes up the present prune market as follows:

"Sales of prunes, carload lots f. o. b. the coast, have been light the past two or three weeks, in spite of the general movement of all dried fruits to almost all markets fron the wholesaler to the retailer.

"Due to the fact that many wholesale dealers have lost money this past season on shipments of prunes from the coast, they do not feel like buying new stocks. This loss was caused by the decline in the price of prunes between the time of purchase on the coast to delivery in the East three or four weeks later.

"Continual reports from the coast have lead eastern buyers to believe there is a tremendous surplus of prunes on the coast. And continual cutting of prices has caused great uncertainty with the trade. Hence its unwillingness to buy ahead.

"In the meantime, prune stocks are being gradually consumed, all of which is a healthy condition."

NICOTINE SULPHATE IN DUST CARRIER

Roy E. Campbell, scientific assistant in truck crop investigations, is author of U. S. D. A. Circular 154. Mr. Campbell's headquarters has been near Los Angeles for several years, where he has been making investigations in truck crop insect control. The successful use of nicotine sulphate in dust form on aphis of walnut trees calls attention to its possible beneficial effect on truck crops. He finds that the advantages of the dust spray include ease of application, killing efficiency, lower cost of application than spraying, with less weight in transportation and haulage, and refilling or renewing of supply in field more quickly accomplished, and the dust application makes easier the use of arsenate, sulphur or other insecticide or fungicide. On the other hand, he finds disadvantages in the volatility of the nicotine sulphate causing it to lose strength unless kept in air-tight cans, the disagreeable effect on the operator, and the impossibility of combining with wet Bordeaux. Mr. Campbell's summary is:

Summary

Ground tobacco gave good though varied results in controlling the walnut aphis in California. The substitution of a certain amount of 40 per cent nicotine sulphate in a carrier of kaolin and lime eliminated this variation in results.

Dusting requires much less material and may be done in a much shorter time, with a less expensive machine, and at about half the cost of spraying.

The action of the dust is similar to that of nicotine sulphate spray, but much more rapid.

Nicotine sulphate dust has proved superior to spraying for the melon and cabbage aphids, onion thrips, cucumber beetles and some other insects, giving usually a better killing at a smaller cost and with a greater speed and ease of application.

Nicotine sulphate dust can be combined with arsenate of lead or sulphur for different types of insects, or for insects and fungous diseases.

BAG FOR GRAIN SAMPLES

A satisfactory bag for grain samples has been developed by the United States department of agriculture. These bags are made of a good grade of duck, treated by the manufacturer with a water and mildew proof preparation. After treatment the cloth is practically as pliable as that used formerly in making grain sample bags. One bag, taken at random from a shipment, was filled with water and allowed to hang until it showed signs of leaking. It was about half an hour before water began to drip from a few places along the seam, but no signs of moisture were evident on the cloth.

In selecting the cloth to be used the department specialists collected and tested a number of waterproof materials from various manufacturing concerns.

The controversy between the California Prune and Apricot Growers Association and the Dried Fruit Association of California over rates for shipping prunes to the Atlantic seaboard has been referred to the shipping board at Washington for settlement.

Dairy Farm at Auction

On Tuesday, April 12, 1921, at ten o'clock in forenoon, I will sell my ranch of about 30 acres located at

Escondido, San Diego Co., California

Black alluvial soil; private pumping plant of never failing water; cheap electric power; underground cement irrigation system; sixteen acres, more or less, in good stand alfalfa; cuts seven crops; milking stable for 17 cows; hay barn; stable for 5 horses with hay barn attached; good house, eight rooms plastered, toilet and bath, and cistern, windmill, tank, etc.; largest pepper trees in California; adjoins city limits of a good business town; close to good schools; 13 churches; new modern creamery ½ mile from barn; good roads, good neighbors, good markets. Escondido is reached by stage and truck lines from all points, also railroads. Best climate in U. S. Dairy consisting of 27 Jerseys and Guernseys, including 3 choice registered Guernsey bulls, will be sold at auction one week later.

Terms of Sale

One-fourth of purchase price in cash on day of sale; also one-fourth of purchase price in cash in 30 days after date of sale; other one-half on time to suit purchaser at seven per cent per annum. Title is perfect; no incumbrance. This ranch is not listed for sale with any agent. Has been occupied eight years by present owner.

G. W. PICKERING, Owner
E. J. Christopherson, Auctioneer.

You Can Prevent Most Chick Losses

The too-frequent heavy death rate among chicks during the critical brooding period is one of the heaviest drains on poultry profits. Baby chicks are expensive—every one that dies is a real loss that can't be made up. It's better to raise the chicks *you have* than to replace them with others.

There is no reason why you should not grow to maturity practically every good chick you hatch or buy. The secret lies in feeding from the first meal the original "baby food for baby chicks"—

Pratts Buttermilk Baby Chick Food

It completely nourishes the chicks, resulting in quick, even, healthy growth and development; carries them safely over the dangerous first few weeks.

Chicks eat so little during the first six weeks that the slight extra cost of the perfect chick food—*the original "Pratts"*—is next to nothing. It is made up many times by the value of the *extra chicks saved*, and the *extra value* of every chick raised.

Let your chicks prove the truth of these statements. Feed them Pratts Buttermilk Baby Chick Food. If it doesn't please *you*—your money back.

Pratts Poultry Regulator

is needed by laying and breeding hens now, when they are laying heavily. Its tonic and invigorating effects help to overcome the strain of continuous laying and they lay eggs that are fertile and hatch husky chicks.

The genuine Pratts Poultry Regulator has been a big aid to successful poultry keepers for nearly fifty years. Why not test it? You are sure to benefit—you can't lose.

"Your Money Back If YOU Are Not Satisfied."

Refuse substitutes—get the genuine Pratts. There's a Pratt dealer near you.

Harvest 20 to 45 Bushel to Acre Wheat in WESTERN CANADA

Think what that means to you in good hard dollars with the great demand for wheat at high prices. Many farmers in Western Canada have paid for their land from a single crop. The same success may still be yours, for you can buy on easy terms,

Farm Land at $15 to $30 an Acre

located near thriving towns, good markets, railways—land of a kind which grows **20 to 45 bushels of wheat to the acre.** Good grazing lands at low prices convenient to your grain farm enable you to reap the **profits from stock raising and dairying.**

Learn the Facts About Western Canada

—low taxation (none on improvements), healthful climate, good schools, churches, pleasant social relationships, a prosperous and industrious people.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan and Alberta, reduced railroad rates, etc., write Department of Immigration, Ottawa, Canada, or

SUGGESTIONS TO SHIPPERS

(Continued from Page 411.)

protected from winds or drafts and should be packed daily. Unless you produce hatching eggs, do not keep any roosters with the hens. In any event, separate the males as soon as the breeding season is over. In hot weather fertile eggs are very likely to spoil.

Grading Rules

Extra eggs must average 24 ounces per dozen from February 1 to July 1, and 23½ ounces per dozen from July 1 to January 31, and no eggs in the case must weigh less than 22 ounces to the dozen.

Slected pullet eggs must average 20 ounces per dozen, and no eggs in the case must weigh less than 18 ounces to the dozen.

"Pewee" eggs are those which weigh less than 18 ounces to the dozen.

All eggs in the above grades shall be entirely white and reasonably clean, the size reasonably uniform, and must be sound, sweet and full.

Brown eggs (this means all eggs that are not absolutely white in color) may be classed as Brown Extras or Brown Pullets, according to size.

Dirty eggs are graded as Dirty Extras or Dirty Pullets, according to size. They also grade as Light Dirties or Heavy Dirties, according to the amount of dirt on them. Light Dirties can be stored if they have not been wet. Heavy Dirties will not keep and they must be sold for what they will bring for immediate use.

Checks or Chex are cracked eggs. They are graded as bakers' eggs, together with shrunken eggs and others that are not good enough in quality to go into the standard grades.

Washed Eggs can be sold at certain times of the year at the same price as the unwashed eggs of the same size and quality, but not during the storage season. For this reason we ask members to wash no eggs during the packing season.

Packing and Shipping

Eggs shrink by evaporation of the contents and thus lose weight quite rapidly, especially if exposed to heat, wind or drafts of dry air. An egg that is just over the standard weight when it is laid, if kept several days before shipping, may shrink and lose weight so much that it will have to go into a lower grade. It is, therefore, important to pack promptly and ship as often as convenient—at least twice a week. If not packed immediately the eggs should be kept covered in a cool place.

In gathering eggs use pails or baskets that will not spring in and pinch the eggs when lifted. Twelve or 14 quart heavy galvanized "stock" pails are very satisfactory, and an old newspaper in the bottom makes an excellent cushion.

In packing your eggs, have a convenient bench or table that will hold your egg bucket and two or three egg cases; also a smaller bucket for the soiled eggs.

First examine your cases and see that sides and bottoms are well nailed; then remove the tops and take out flats and fillers and see that there is a good cushion under each bottom flat. If the cushion is not good, make one by using a little excelsior or straw.

Have a convenient shelf for your egg scales, and when packing have a case for extras and one for pullets; grade eggs into extras and pullets as you pack them, and check any doubtful egg on your scale as you pack.

Every shipper should provide himself with an egg scale, which may be obtained at cost from the association.

Slide the eggs into the fillers—don't drop them—and when a filler is full, pass the hand over the eggs and see that none project above the filler before you put in the next flat and filler.

Washed Eggs

During the season when washing is permissible all soiled eggs should go into a special bucket as you pack the others. You can later scrape the heaviest of the dirt from these eggs and wipe clean with a damp cloth, thus making a separate operation of cleaning and packing these soiled eggs. Always pack these washed eggs separately and mark the fillers with the colored slips provided for that purpose.

When cases are filled place a "grade slip" on the top filler under the cushion. This should state clearly the name and address of the member, the number of dozens of each grade packed in the case, and the number of cases in the shipment. The same information should also be given on the "shipping tag," which should be tacked on the outside end of each case.

It is a good idea to use a rubber stamp for the name and address on grade slip and tag. We supply such stamps at cost to all members desiring them.

Nail covers with four nails at each end of the case. Do not nail in the middle, as this causes the cover to be broken up in taking it off.

Please remember that your eggs are inspected by your own employes, who have nothing to gain by misrepresentation, but on the contrary have every reason to wish to please you.

In handling so large an amount of business mistakes will occasionally happen, but if called to our attention they will be promptly rectified.

When in Los Angeles call at the warehouse and see just how the work is done.

If further information is desired, write to Poultry Producers of Southern California, Inc., 1560 Industrial Street, Los Angeles, California.

Poultry Queries

Conducted by J. A. Koethen

Rheumatic Turkey

One of my turkey hens is quite lame. First joint of left leg is swollen and puffy and slightly feverish. Otherwise she seems perfectly well and is gaining weight. What can I do for her, and will it be wise to use her eggs for hatching?—Subscriber, San Diego.

The iodine you have been using is as good an external remedy for rheumatism as there is. Rubbing with camphorated oil is also helpful. Keep her out of the rain and see that she has all the green feed she will eat. It would hardly be wise to try to hatch eggs laid while the joint is feverish. The trouble is probably due to exposure, and keeping her in a dry, sunny place is the best remedy.

Intestinal Disturbance

Some of our pullets on range have suddenly become helpless and died after lying a day or two with legs stretched out or back. Others die without any apparent illness. They have dry mash in the morning, Egyptian and Kafir corn in litter, and sorghum tops to thresh out for themselves at noon.—Subscriber, Orland.

Those pullets have been eating something which has poisoned them. Maybe some of their grain is spoiled or the mash has been rained on and become moldy, or they have found a dead chicken or gopher on their range. It would be wise to keep them in for a few days till a thorough investigation has been made. Meantime give the whole flock a dose of Epsom salts, a half teaspoon for each bird, dissolved in water and mixed in moist mash. More variety in the scratch feed is desirable. You might feed Kafir and wheat or Egyptian corn and barley, or all four grains, and be sure that everything you feed is sweet and clean.

Turkey Book

Please tell me where I can get a book on turkeys, telling how to raise them.—Subscriber, Bridgeville.

The Cultivator book, "Poultry for Profit," contains a good deal of information in regard to turkey raising. I know of no recent publication devoted exclusively to turkeys except two circulars of the Rhode Island station, Bulletin 141 and Extension Bulletin No. 2, New Series, which, if they are

still in print, may be had for five cents apiece by writing Agricultural Experiment Station, Kingston, R. I. There is also a government bulletin, Farmers Bulletin 791, which goes into the subject quite thoroughly. This may be had free by writing the U. S. Department of Agriculture at Washington.

Vaccination

Will you please explain how to vaccinate for chicken pox? Where are instruments and serum to be had and at what age is it done? What would be the cost of vaccinating 1,000 birds? —Subscriber, Whittier.

Write Dr. Beach, Poultry Division, College of Agriculture, University of California, Berkeley, for serum and directions. Birds of any age may be vaccinated, and I believe it costs approximately ten cents per bird.

American Pigeon Journal

Walter T. Helm of El Rio, Ventura County, writes:

"Under your Poultry Queries in issue of March 5 I notice your reference to National Squab Book. When this book was written it was the best authority that we had, but today it is about obsolete, as the Homer, that formed the basis of the book, has gone into the discard, and today we have such breeds as Carneaux, Maltese, King and Mondaine for squab producers. Would suggest referring to American Pigeon Journal.

Vent Gleet Perhaps

My hens are afflicted with a sticky, whitish discharge from the vent, which conforms in some respects to your description of vent gleet, but there is no odor, and the flock without a male is as badly affected as the mated flock. They have corn, a commercial mash, sour milk and plenty of green, are laying well and otherwise in perfect condition.—Subscriber, Seeley.

Vent gleet usually begins with a hen, is transmitted by her to the male, and by him to the rest of the flock, so there is no significance in the fact that the unmated birds have the same discharge as the mated ones. It does seem unlikely, however, that the whole flock should be affected with vent gleet, and the lack of odor is another point against it. If I were you I would look to their digestion before attempting treatment for vent gleet, which is very difficult to treat. Corn is not good as an exclusive grain ration. Better change to wheat and barley or wheat and milo. Two grains are always better than one. Make your mash half bran, and add a little powdered charcoal. There is sometimes a whitish discharge in diarrhoea.

No Yard House

In your issue of February 12 your poultry expert has an article in which she speaks of the no-yard house. Are the hens kept in this house all the time or is a runway provided?—Subscriber, Springville.

No run or yard of any sort. The pullets go into the house before they begin to lay and never go out till they are sent to market. After they are accustomed to the house they can hardly be driven out.

Poultry Literature

Will you kindly send me Circular 142 of the California experiment station? I have not the address of the station. I should also be grateful if you would recommend reliable literature for a beginner. — Subscriber, Chino.

I am sorry to say I loaned my copy of Circular 142 to an inquiring subscriber and it has not come back. Write Poultry Division, College of Agriculture, University of California, Berkeley, for this and other poultry circulars, and they will send watever is in print free. Of late the university has been so handicapped for lack of funds that typed letters are sent instead of printed circulars, but they are glad to send out free anything they have that will be of use. You should also have the Cultivator poultry book, "Poultry for Profit," which gives full directions for making a start with chickens as well as for raising ducks, geese and turkeys. Nearly all the state experiment stations publish helpful bulletins. Write Cornell Experiment Station, Ithaca, New York, Oregon Experiment Station, Corvallis, Oregon, Iowa Experiment Station, Ames, Iowa, Connecticut Experiment Station, Storrs, Connecticut, and U. S. Department of Agriculture, Washington, D. C., and ask what they have that will be useful to beginners. The state stations charge a little for bulletins sent outside the state but government bulletins are free.

The Okanogan County Horticultural Society, Washington, has been organized with J. R. Everett president.

The Douglas County Poultry Association, Washington, is promoting the raising of standard bred poultry by encouraging organization of boys and girls clubs. The association furnishes the eggs for hatching, the stock to become the property of the youngsters.

THERE'S a reason for everything. Nothing ever "just happens." My success with poultry is not an accident or a matter of "luck"—here are the three reasons my hens pay:

The FIRST reason:

My success begins with the baby chick. I start them on the right feed, and in that period when baby chicks so easily sicken and die, the pure dry buttermilk in Globe "A-1" Baby Chick Mash, and the fine balance of ground grain, grain hearts and meatine, builds them to vigorous youngsters, makes them grow, and acts as a safeguard against disease.

The SECOND reason:

My growing chicks are well fed. Experience has taught me not to "stint the ration and stunt the bird." During the stage of rapid growth, when the making of bone, muscle, flesh and feathers demand feeds high in protein, Globe "A-1" Growing Mash (containing Dry Buttermilk) brings them to maturity as strong, healthy birds ready and fit to lay.

The THIRD reason:

I know that it takes feed to make eggs—and so I feed an egg ration—Globe "A-1" Laying Mash (containing Dry Buttermilk).

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

Your hens can't eat color —they want feed!

Your hens don't care about the color of their feed—why should you? They want feed that is good—and you want feed that is good for them.

The color of your feed has absolutely nothing to do with its feeding value. It may be light or it may be dark and yet not vary one-tenth of one per cent. in actual feeding value. Feed for your hens should be bought on its chemical analysis—on its *actual* feeding value—not on its color or texture.

Take SURELAY, for example. It may vary in color from time to time. But it never varies in chemical content—in net feeding value. It contains at least a dozen ingredients balanced and blended according to a formula that has stood the test of time. Our daily laboratory tests (something the hand-mixer does not and cannot have) assure *absolute uniformity* at all times.

SURELAY is proud of the things that go into its making. Long before the present feed law became effective, the exact analysis of SURELAY was printed on the back of every sack. Today, as always, you know what you're buying when you buy SURELAY. You know it is a top-grade, *uniform* feed that will make your hens pay by making them lay.

If you haven't seen the new edition of our booklet, "Makes Hens Happy," we'll be glad to send you a copy. Don't bother to write a letter—simply fill in the coupon below and mail today!

STOCK AND POULTRY FOOD DEPARTMENT
SPERRY FLOUR CO.
STOCKTON - CALIFORNIA

SURELAY
"A Sperry Product"

A good thing to remember!

More and more poultrymen have begun to see the light on this color question. The less you care about color or texture and the more you care about feed value—the better feed you will buy, the better your hens will like it, and the more eggs you will get. That's a simple, straight formula—and a mighty good thing to remember.

THERE'S one test—and only one test—of feed. And that's *feed value*. No poultryman—no matter how seasoned he is—can tell the quality of a feed simply by *looking* at it or *feeling* it. Because a feed can be light or dark, fine or coarse, and yet not vary one-tenth of one per cent in actual feeding value.

Is there any difference in the feeding value of yellow, white or mixed corn? No! Is there any difference in the feeding value of white, gray or red oats? No! Is there any difference in the feeding value of white or red wheat? No! The same thing applies to meat meals, oilcake meals, charcoal and other ingredients that go into the blending of a proprietary feed.

That's why color means little, if anything. Texture means little, if anything. Feed value means *everything!* Feed value, after all, is the thing you pay for.

And SURELAY sees to it that your hens get the *same feed value* every time. It may vary in color from time to time. It may vary a bit in texture. But it *never* varies in net feeding value. Our daily laboratory tests take good care of that!

If you want to see why SURELAY is a high-grade *uniform* feed that will make your hens pay by making them lay—send for the new edition of our booklet, "*Makes Hens Happy.*" Your copy is waiting for you—and it's free. Simply fill in the coupon and mail today!

California Is Justified in Boasting of Its Wonderful Production

CALIFORNIA CULTIVATOR

and LIVESTOCK and DAIRY JOURNAL

Los Angeles — *An Illustrated Weekly for the Rural Home and Ranch* — **San Francisco**

Vol. LVI — **April 2, 1921** — **No. 14**

CALIFORNIANS, ATTENTION! We have long been accused of being boasters. We have insisted we have simply told the truth and could deliver the goods. In fact, we have been engaged in delivering the goods during the past decade. Agricultural goods, we mean. The figures which have come from the department of commerce as to the fourteenth census show California's rich valleys and hillsides to be wonderful producers of wealth.

Of the 12 highest counties in the United States producing the greatest value in agricultural crops, six are within the boundaries of California.

The rating of these counties is first, third, fourth, eighth, eleventh and twelfth, and they are by name, Los Angeles, San Joaquin, Tulare, San Bernardino, Santa Clara, Orange.

In order to give the Pacific Coast the majority of these great producing counties, Whitman County, Washington, enters the roll of honor as sixth.

Ten years ago Californians were highly gratified over the fact that for the first time in the country's history the banner for county producing greatest value in crops came this side of the Rockies. The decade preceding had given that honor to Lancaster County, Pennsylvania (in 1910 taking second place.) A few weeks ago we referred to this and to the fact that California producers were watching for release of the figures of greatest crop production, or rather, crop production for the year 1919, which formed the basis for the 1920 census reckonings. Now comes the information that Los Angeles County is again the winner.

THE FOURTEEN HIGHEST PRODUCING COUNTIES OF THE UNITED STATES

	1919 Crop Value	1919 Rank	1909 Crop Value	1909 Rank
Los Angeles, Cal.	$62,212,843	1	$14,720,884	1
Orange, Cal.	22,735,381	12	6,176,337	52
San Bernardino, Cal.	26,681,925	8	6,818,233	39
San Joaquin, Cal.	39,748,032	3	9,082,240	10
Santa Clara, Cal.	23,679,237	11	6,968,438	34
Tulare, Cal.	33,329,607	4	5,353,994	90
Champaign, Ill.	23,688,925	10	9,991,658	9
Iroquois, Ill.	21,325,488	14	10,607,811	6
La Salle, Ill.	24,191,389	9	10,222,235	7
Livingston, Ill.	22,081,892	13	11,377,297	5
McLean, Ill.	26,887,618	7	12,811,506	3
Aroostook, Me.	52,541,205	2	10,150,955	8
Lancaster, Pa.	32,803,002	5	13,059,588	2
Whitman, Wash.	30,824,407	6	12,540,694	4

	Farm Value 1919	Farm Value 1909
Los Angeles, Cal.	$396,915,164	$199,998,200
Orange, Cal.	176,702,336	64,357,852
San Bernardino, Cal.	99,648,710	68,499,103
San Joaquin, Cal.	140,600,079	67,286,628
Santa Clara, Cal.	149,875,192	67,187,549
Tulare, Cal.	198,312,596	76,539,642
Champaign, Ill.	233,673,411	123,312,914
Iroquois, Ill.	196,789,973	105,107,898
La Salle, Ill.	213,717,738	114,911,820
Livingston, Ill.	230,814,178	121,558,684
McLean, Ill.	267,332,051	147,846,611
Aroostook, Me.	77,759,226	44,220,004
Lancaster, Pa.	119,842,187	84,426,907
Whitman, Wash.	135,765,506	67,357,022

Because of the slump in lemons and some other disastrous crop returns it had been feared that perhaps Los Angeles County might not be able to hold the banner, but notwithstanding these losses Los Angeles County produced during the year 1919 field and orchard crops to the value of $62,212,843, while the next highest county, Aroostook County Maine, produced nearly $10,000,000 less or, to be exact, $52,541,205. But Los Angeles County is not alone in California counties holding honors, for San Joaquin County comes third in all the counties of the United States. Tulare County, again, comes fourth, San Bernardino County is eighth, Santa Clara County eleventh and Orange County, twelfth of all the counties of the country. We have not yet received the figures for other California counties, but the thirteenth census (1910) report as to agriculture showed San Joaquin second in the state with about $9,000,000 production; Fresno third with nearly $8,000,000; Santa Clara with nearly $7,000,000; San Bernardino with almost $7,000,000 and many other counties with remarkable records.

The figures given in the enclosure on this page are subject to correction, but it is hardly probable that the rating of these counties will be changed. Especially is this true as to Los Angeles County which holds first place with nearly $10,000,000 above its nearest competitor.

The state next most highly honored is Illinois, which has three counties in the first twelve; likewise the thirteenth and fourteenth in the list. The only other counties of the East—

(Continued on Page 455.)

The Tioga Plan is for the Small Orchard and Ranch Owner

DO you want to earn from $30 to $40 a day during your spare time? It can be done—*is* being done—*you can do it.*

Here is an example: T. T. Lovelace resides west of Los Angeles. To do his farm work he bought a *Tioga Strength Tested Tractor* because of its celebrated P. T. Track *(Positive Traction)*—the biggest single advancement in tractor design in two years. With it, and the surplus—yes, *extra power* afforded, *he can plow, disc, cultivate, scrape, level* and do all kinds of farming and other operations on side hills, over rolling land, down into sloughs, in adobe, sand, silt, anywhere, *and he makes from $30 to $40 a day on the average* when he does custom work; that is, work for other farmers, contractors, etc., *of which there is plenty to do.*

Whether you farm ten acres, or one thousand acres, it is necessary to have a tractor with sufficient power so you can handle, efficiently, all your work. You should not be governed by the size of your orchard or ranch when purchasing a tractor; in other words; your machine must have sufficient power and traction to take care of any difficult work. *The Tioga plan will enable you to do this.*

We want to correspond with those who *wish to make a tractor pay for itself and earn what the investment and energy entitle the owner to receive.*

This is a new departure, so far as we know, in *tractor* merchandising. Our organization is planning, and carrying out other plans of far reaching effect, that, we believe, will make fortunate *Tioga Strength Tested Tractor owners* the most successful and prosperous tractor owners in California.

(1) Tioga handles side hill work, with loose soil conditions, efficiently. (2) Notice rear wheels riding surface of ground. No digging in or soil packing. (3) Tioga Tractor pulling 3 14-inch plows 8½ inches deep in soggy soil. (4) P. T. Track used on Tioga helps lay and break up cover crop before being plowed under. (5) Tioga pulling goose neck cultivator up 25% grade. Loose soil conditions. (6) Tioga Tractor pulling 3 14-inch plows in a cover crop in San Fernando Valley consisting of wild mustard and clover. These weeds stand 4½ feet tall and some of them are ½ inch thick. This is the first time over and not a weed showed after being plowed.

Why the Tioga Does This

A technical description of any tractor fills an ordinary book. *ONE FEATURE OF THE TIOGA,* the *P. T. TRACK (POSITIVE TRACTION)*, gives it several advantages over both ordinary wheel type and tracklayer tractors. This achievement in tractor building means 700 square inches of ground contact, with weight of only five pounds to the square inch. *No slippage* or *digging—Maximum traction.*

TIOGA
STRENGTH TESTED
TRACTORS

MANUFACTURED BY
THE TIOGA TRACTOR CO.
Subsidiary Steinmetz Electric Motor Car Corp.
Dr. Chas. P. Steinmetz, Chief Consulting Engineer

Fill out this blank as completely as possible and mail promptly for proposition.

THE TIOGA TRACTOR CO.,
1957 South Los Angeles St., Los Angeles:
Without any obligation on my part, please send me information about the TIOGA STRENGTH TESTED TRACTOR and the TIOGA PLAN.

My Name.....

Postoffice .....

R. F. D....., Box.....

I am farming.....acres of.....

There are.....Orchards within a radius of four miles.
Ranches

I (do) (do not) own a tractor.

Every other part of the *TIOGA TRACTOR* shows the highest type of engineering skill and design equal to the *P. T. TRACK* and two years of actual operating under all kinds of conditions *PROVE ITS GREAT VALUE AND DEPENDABILITY.*

THE TIOGA IS A QUALITY TRACTOR, made by an unusually strong organization, both in a financial way and with many years tractor building experience. This coupled with the fact that each and every part is thoroughly tested, enables us to back the *TIOGA* up with a year's guarantee of service gratis.

Are You With Us on the New Deal?

We want to hear from farmers who wish to know more about the *Tioga Tractor* and how others are making $30 to $40 per day operating them on the *Tioga Plan.* It costs you nothing to get this and writing for it places you under no obligations to us whatever.

The *California Cultivator* guarantees its advertising and we will tell you the honest facts about our proposition, if you will be as frank and candid with us. There is work and demand for at least five times as many tractors, right here in California, as we can make this season. We expect to sell our entire factory production through the highest type of salesmanship and render real service.

With a plan to cooperate and help you to earn money; with arrangements being made with banks, wherever we have inquiries, to participate in the TIOGA PLAN, we offer you and others what we believe will prove decidedly interesting to the farmers and ranchers of California at this time. Inquiries will be answered in the order in which received.

California Cultivator

Vol. LVI, No. 14 | Los Angeles, April 2, 1921 | One Dollar Yearly

Grapefruit Culture in the Imperial Valley

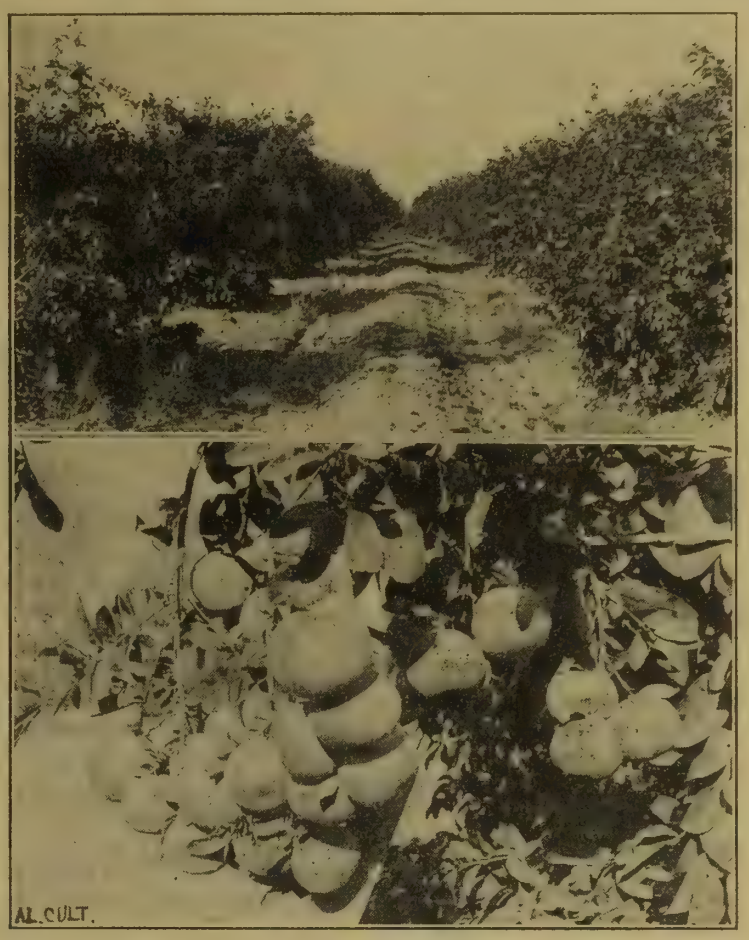
By Robert W. Hodgson

HAVING recently enjoyed, through the courtesy of Farm Adviser E. L. Garthwaite, the opportunity of making a brief survey of the grapefruit industry of the Imperial Valley, the writer has no hesitancy in saying that whatever experimental period there may have been in the culture of this fruit in Imperial County is definitely over. The raising of grapefruit in the Imperial Valley is at the present time a commercial industry and an unqualified success. Orchards were observed which several years ago reached the commercial bearing age and are now carrying crops in every way comparable with those borne by trees of similar size in any other part of the state. And the quality of the fruit leaves little to be desired, in the writer's opinion fully equal to and on the average greatly superior to that of grapefruit produced in any other part of the state. To be able to pick grapefruit directly from the tree and eat it out of hand without the addition of sugar—and to enjoy it—is certainly a novelty, and one not usual to most grapefruit districts.

The Imperial Valley enjoys not a few distinct advantages in the growing of grapefruit, and also has its share of problems. Among the former not the least in importance is the relatively low cost of land and water. In this respect this valley is to be classed with the citrus districts of Northern California. Excellent land adapted to the raising of grapefruit may be had at from a fourth to a third the cost of similar land in any part of the great citrus districts of Central and Southern California. And the cost of water is but a fraction of that in the other citrus growing areas of the state. These are both enormous advantages and of course are due primarily to the newness of the district.

Among other outstanding advantages are those of precocity of the trees and earliness in maturity of the fruit, undoubtedly due in a large measure to the high summation of heat units during the growing season and applying not only to grapefruit but to practically all other crops as well. Three years after planting respectable crops may be expected and commercially profitable crops at four years from setting are the rule. The trees are remarkably large for their age, there being at least a full year's difference in size between trees of the same age in the valley and in other parts of the state, and in many cases the difference is even greater.

The fruit reaches maturity early, the picking season beginning early in October and being practically over by the middle of February, in this respect being fully six weeks earlier than in most other parts of the state. This earliness of maturity is undoubtedly a most important advantage since it means practically no competition from other districts, at least during the fall and winter months.



Grapefruit in the Imperial
Upper: Imperial Valley Grapefruit Orchard. Bottom: As They Grow 'em in Imperial.

Add to this the superior quality mentioned above and one has a most formidable list of natural advantages enjoyed by the Imperial Valley grapefruit industry. The high quality of the fruit is unquestionably due to at least two principal factors, the planting of trees propagated from the very best strain of the Marsh Seedless variety, and the unusual climatic complex occuring in the valley. In this connection it is an interesting observation made by horticulturists time and again that quality of fruit apparently increases as the climatic environment approaches the limit beyond which the variety cannot be successfully grown. In the Navel orange this is particularly noticeable, the finest quality fruit invariably being produced in districts where the difficulties encountered in successfully raising the trees are the greatest—and still the trees survive. Thus the best flavored fruit as well as finest in texture is produced in interior districts where the greatest temperature fluctuations occur, and closest to the frost line. Hardier than any other of our principal citrus varieties, this is apparently the case with the grapefruit in the Imperial Valley, a heightening of quality occasioned by the severity of the environmental situation. In the writer's opinion the climatic complex which is responsible for the outstanding quality of Imperial Valley grapefruit also renders the growing of oranges and lemons commercially im-

(Continued on Page 455.)

Community Ownership of Tractors

IN an address before the Citrus Institute at San Bernardino, W. H. Fleet, manager of the Sespe Rancho, dealt with emphasis on the advisability of not overloading the tractor. Buy one of sufficient power if you want it to last and render efficient service. Mr. Fleet's address was most illuminating as to comparative value and economy of horse power and gas power. In effect, the conclusion of the entire article was: "It depends."

However, Mr. Fleet was emphatic in this, that the tractor has come to the orchards of California to stay. There are types of work and there are rush seasons of work when the tractor gets under the load and does it efficiently and quickly.

The small orchardist, however, finds himself unable to give sufficient work to a tractor to justify its ownership and upkeep. He realizes there are seasons, even in very small properties, where his team is unable to get under the entire load and do it as quickly as it should be done. San Dimas and some other sections have solved this problem by community ownership. A cooperative association is formed, the tractor, or perhaps tractors, are purchased, qualified superintendent and drivers are employed, and the community has its work done at the minimum of cost. Again, another plan is proving remarkably satisfactory, and with less of risk and practically no trouble to orchard or field owner. This is contracting with owner of tractor and equipment for a stipulated sum or per day or per hour. This plan is perhaps the most satisfactory where the individual owner can be induced to take up this line of work. We are not certain but that this field offers a remarkably attractive opening for those who are financially able to bear the initial expense. The publicly owned or privately owned machine under this contracting system would supply to the neighborhood a tractor of sufficient power, as Mr. Fleet suggested at the San Bernardino meeting, to do the heavy plowing, subsoiling and other heavy draft work. Under this plan the capitalization would be greatly reduced for every neighborhood. Parts of Mr. Fleet's conclusions are here given.

"Our ranch is somewhat of a broken nature. It is divided into tracts of from 30 to 100 acres. We call them natural subdivisions, as they are bounded by bluffs, arroyos, railroad and county roads. Our soil varies from heavy adobe to a heavy and light silty loam and each of these types of soil is further complicated in many cases by rocks and gravel. The topography of our tracts varies from those which are practically level to those embracing rolling land and hillsides. You can see from the description of our property that we cannot use tractor power on all of our tracts. In 1913 we purchased two tractors, one a 30 horsepower, the other a 60 horsepower. We have operated these two tractors seven years."

Mr. Fleet then gave tables from which he reached this conclusion:

"You can next see that with depreciation added the cost per day's work done is $1.67 with tractors and $1.40 with animals. By adding seven per cent interest on capital invested both in tractors and animals for seven years we have a cost per day's work done of $1.82 in tractors as compared with $1.49 in animals. This difference in favor of animals is brought about in part by the fact that the animals did almost double the number of days work that the tractors did."

But this disadvantage may be more than made up by the emergency advantage, that is, under stress the tractor is capable of working 24 hours per day while the horse must have an occasional day of rest, besides he is never able to put in more than half of the 24 hours. This is a point especially appreciated at this season of the year. Cover crops are being plowed under as rapidly as possible and when two or three days' delay means irreparable loss of moisture and of right soil conditions, a neighborhood or a contracting tractor may save the day and soon pay for itself. If desert heat prevails there is no danger of a tractor suffering sunstroke. She still plunges through without even a collar gall.

Agricultural News Notes of the Pacific Coast

Northern California

Gridley, Butte County, is making a shade tree planting campaign.

Chico, Butte County, will hold its second annual Flower Show, May 21.

Cloverdale, Sonoma County, is planning for its annual May Day celebration.

Livermore, Alameda County, farm center is making a membership campaign.

Penryn farm center recently tendered banquet to retiring Farm Adviser Amundsen.

Many rural sections of Alameda County are opposing consolidation with city government.

During the last week of February 30,750 dozen eggs were shipped from San Francisco to Hawaii.

Hayward members of the Japanese Exclusion League are making a drive for new members and additional funds.

The Alameda County farm bureau is uniting with the bureau of soils of the U. S. D. A. in making a soil survey.

Butte County farm bureau is unanimous in regard to membership in state and national farm bureau federations.

Chico Almond Growers Association is discussing coming season's output and methods of producing a larger and better crop.

Solano County Horticultural Commissioner Owen is conducting the county's annual squirrel drive which began April 1.

Orland, Glenn County, has a calf club which has the cooperation of the county's best Jersey breeders and all the banks of the county.

Contra Costa County farmers have invested more than $3,000 in carbon bisulphide for the first part of the campaign against squirrels.

A bargeload of rice consisting of 20 carloads was recently sent from Sidds Landing and Butte City. It was grown by Hindus, Japanese, Chinese and Californians.

The Poultry Producers of Central California handled during January an average per week of 9,837 cases of eggs. This is 91 per cent more than last January.

Poultry clubs have been organized in the Rio Linda, Del Paso and Franklin centers of the Sacramento County farm bureau and an egg laying contest has already been started.

Japanese bosses of laborers in the hop fields are demanding increased wages for work of grubbing. Growers are becoming incensed but find the Japs so far in control of the situation.

The P. G. & E. people have been given permission by the state railroad commission to make certain transfers of properties from the Northern California Power Company, connected with the Pitt River project.

Grape growers of Cloverdale recently met and resolved to support to the fullest the Grape Growers Exchange. It is claimed that California produces over 90 per cent of the grape crop of the United States.

The Cloverdale center of the Sonoma County farm bureau has decided to make a vigorous campaign for new members. One of the principal improvements contemplated is clearing the Russian River and reclaiming valuable agricultural land.

Central California

Fresno district fair, September 26. October 2.

Heavy rain and snowfall are reported in Sequoia Park.

Lindsay, Tulare County, is making shipments of broccoli.

Great plans are in the making for the celebration of Raisin Day.

There is being planted this year over 20,000 acres of grapevines.

Stanislaus County Poultry Association is buying feed for members.

A carload of eggs was shipped from Modesto direct to Cuba on March 4.

Oakdale, Stanislaus County, has decided on August 25-27 as fair dates.

Stanislaus County Poultry Association is discussing cooperative feed buying.

The Stanislaus Holstein Breeders Association held a sale at Gonzales, March 24.

The Ceres Farmers Union entertained a large number of visitors at its last meeting.

Turlock irrigators are fighting adoption by the state legislature of Senate bill No. 597.

Today, April 2, is date of the annual meeting of the Milk Producers of Central California at Modesto.

The West Joaquin irrigation district has been meeting and listening to report of the state engineer.

Cotton growers of the San Joaquin Valley are to meet in Fresno and confer as to their common interests.

The California Associated Raisin Company has fixed April 2 as closing date for the new contract campaign.

The land colony at Delhi has purchased a Holstein bull, De Kol Pontiac Tatti, from E. M. Morrow at Modesto.

Commissioner Collins of Tulare County is inspiring a squirrel campaign among the inspectors of the county.

Three farm bureau centers of Tulare County have just secured moving picture machines for community entertainments.

Ten trial plots have been located in San Joaquin County for trying out purple vetch under supervision of the farm bureau.

A quarter of a million dollars for a road into Kings river canyon is the objective of a bill introduced into the state legislature.

Fresno County beekeepers are fighting against Tulare County's new ordinance which provides for exclusion of Fresno colonies.

The farm advisers annual conference trek will begin at San Francisco, May 23, making tour of the San Joaquin Valley, ending May 28.

Official opening date for General, Grant, and Sequoia national parks, May 24; closing date, October 10. Yosemite is now open the year around.

Modesto proposes to organize a $100,000 corporation to handle sorghum syrup. It will be known as the California Sorghum Syrup Products Company.

Cotton growers of the San Joaquin Valley are planning to hold a mass meeting at Fresno for the purpose of forming a cooperative association. Most of this year's crop is still in the hands of the growers.

Southern California

Grain farmers especially are happy over the recent heavy rains.

Twenty-five hundred acres of sweet peas are grown for seed in California.

A lemon and orange pruning demonstration was held at La Verne, March 15.

Banning, Riverside County, is rapidly shipping its last season's almond crop.

October 21-23, Date Festival of the Coachella Valley. The festival will be held at Indio.

Utah and Idaho people picnicked at Sycamore Park, Los Angeles, Saturday, March 26.

The Covina Valley Fumigation Association has been organized with capital stock of $75,000.

The Rialto board of trustees has appointed a committee to look after street tree planting.

Date growers are asking that date palm trees be exempt from taxation for the first eight years.

The Santa Fe railway company insists that its name is not pronounced Santa "Fee" but Santa "Fay."

The San Gabriel Valley Associated Chambers of Commerce is taking up the matter of a daylight saving ordinance.

The directors of the Imperial County farm bureau have turned down the proposition of holding a county fair in the fall.

One day's shipment of lettuce from the Imperial Valley totaled 21 cars. Imperial Valley is shipping tomatoes in carlots.

The Murietta center of the Riverside County farm bureau held a gopher demonstration on the afternoon of March 28.

The cotton crop of the Palo Verde Valley for the season of 1920 was 16,000 bales. The gins have closed for the season.

The first meeting of the newly organized Yucaipa farm bureau center was held March 15. The new center starts with 76 members.

Cotton growers of Blythe, Riverside County, are considering establishing a factory to make cotton goods to secure some return for their crop.

A series of poultry culling demonstrations will be given this summer in the Lankershim district, Los Angeles County, by experts from the college of agriculture.

The shipment of citrus fruits by water from San Pedro is interesting growers of other products, many of whom went to the harbor to watch the loading of the "Liberator."

Imperial Valley shippers have sent telegrams to traffic managers of the great railway systems asking reduction in freight rates in order to save the cantaloupe crop, now estimated at 9,000 cars.

A poultry department has been organized in the Riverside County farm bureau. One object is to secure the services of a poultry specialist for Southern California. Another is to start an egg laying contest.

It is reported that companies owning a large number of trucks will contest the Orange County ordinance fixing maximum load at 23,400 pounds. This is said to conflict with the state law which puts the maximum at 30,000.

The Coast and General

Montana wheat is reported exceptionally fine.

Japanese have opened steamer line direct to Manzanillo, Mexico.

Farmers of Okanogan County, Washington, have decided upon a ground hog eradication campaign.

The Oregon Cooperative Dairymen's League has just taken in a block of 500 members along the lower Columbia.

The federal bureau of animal industry is starting a campaign for eradication of sheep scab in central Oregon.

A grower at Toledo, Washington, has just shipped two carloads of certified American Wonder seed potatoes to California.

The biennial report of the Oregon state engineer shows organization in that state of something over 60 irrigation districts.

Grain growers in the vicinity of Pomeroy, Washington, have purchased from one company 160,000 sacks for next year's harvest.

A cut of ten cents a box in the water rate shipment on apples from the Northwest has been announced by the Royal Mail Steam Packet Company.

Fruit growers in the Wenatchee Valley of Washington have signed up 4,200 carloads of fruit this season. This is at least 35 per cent of the total crop.

Local farm bureaus in Kittitas County, Washington, have completed survey of all the farm animals in the county, the object being to eradicate scrubs.

Honey producers the country over are anticipating a very good season. Most of the larger market centers of the East report supplies light, prices holding firm.

Montana's winter has been the mildest since the establishment of the weather bureau and now heavy snowfalls are being reported which will give moisture for early spring seeding.

An American Chamber of Commerce has been established at Alexandria, Egypt. It is expected that not only commercial advantages will be secured but advantages to farmers of America.

Washington State Holstein-Friesian Association held its annual meeting in Seattle, March 1, reelecting Fred H. Stimson, president, and Stanley V. Butchart of Sunnyside, executive secretary.

The North Marion County Berry Growers Association, Oregon, at its recent annual meeting at Woodburn recommended minimum rates on loganberries, 7 cents; raspberries, 12 cents; strawberries, 9 cents; gooseberries, 7 cents.

H. E. Sellwood of Portland has been elected president of the Oregon Poultry and Pet Stock Association. The association expects to hold its show this year at North Portland in connection with the Pacific International Livestock Exposition.

Wheat growers' associations of Idaho, Oregon, Washington and Montana have formed the Northwest Wheat Growers Association, which will be their selling agency, with temporary headquarters at Spokane. C. W. Nelson is sales manager, George C. Jewett, general manager.

The Grain Marketing Plan

THE Farmers Marketing Committee of 17, after six months intensive study of grain distribution and marketing has worked out a grain marketing plan to submit to the grain growers of the United States.

This plan will, in the opinion of the committee, eliminate waste in distribution, excess freight charges, provide for orderly marketing and more stable prices, and add materially to the net returns to the grower without increasing the price to the consumer. Grain selling will be concentrated in the hands of a national sales association, with membership and voting control limited to actual grain growers. This sales association will establish branch offices at all principal grain markets, including seats on boards of trade if they are found to be desirable. It will establish a complete system of gathering and interpreting statistics of world conditions affecting supply and demand. It will provide adequate means for financing orderly grain marketing through a subsidiary finance corporation. A subsidiary warehouse corporation will provide terminal and district warehouses with cleaning and conditioning machinery. An export corporation, also a subsidiary of the national sales association, will find foreign outlets for surplus grain. All money received for grain, less operating and handling costs, will be returned to the growers.

The best features of all successful cooperative marketing companies have been included in the new marketing plan, in the opinion of the committee. The plan makes no attempt to put grain marketing at once on a nation-wide pooling basis, but provides means for the development and extension of pooling as experience proves its adaptability to the grain business.

There are three fundamental elements in the proposed grain marketing system: The grain grower; the local cooperative elevator company or grain growers association; the central sales association.

The term "grain grower" includes any person who raises grain, and any land owner who receives all or part of his rent in grain. To become a member of the proposed grain marketing organization, the grain grower must do two things: Join the national sales association, paying the membership fee, which will probably be $10 for a permanent membership; sign a contract to deliver all of his surplus grain to the local elevator company or grain growers association for a period of probably five years.

How Grain Is Handled

The surplus grain of the members in a given locality may be handled in any one of two ways, as the members may decide.

It may be handled by the local cooperative elevator company or grain growers association just as at present—by purchase from members or by shipping for them on consignment.

It may be pooled. In such cases the directors of the elevator company or grain growers association will sell the grain at such time as seems most advantageous, and at the expiration of the pooling period will return to each grower the average price received for the grain of his kind, variety and grade, less cost of handling. Pools may cover any period of time up to one year.

Farmers Elevators Basic Part of Plan

The local cooperative elevator companies, which have been so successful in solving the grain marketing problem locally, are to be retained as a basic part of the new grain marketing system.

In order for an elevator company to become an integral part of this grain marketing system, however, it must be truly cooperative and owned by members of the National Sales Agency. A reasonable time will be allowed for elevator companies to make readjustments necessary to meet these requirements.

In case an elevator company does not meet the requirements within the time allotted, and in localities where there is no farmers elevator company, the members of the national sales association in a given locality will organize themselves into a local grain growers association. This association may then provide for the handling of its grain in any one of the following ways:

It may contract with a local farmers private or line elevator to receive its grain and load it for shipment for a handling charge mutually agreed upon; it may rent an elevator; it may build or buy an elevator.

This Month in the Ornamental Garden

Southern California

By Ernest Braunton

APRIL is, perhaps, the most unstable month for gardening of all the year. We may have much or no rain, nights so cold as to closely approach frost, days so hot that all who garden will succumb to "spring fever." What the month holds in store none may say, so be prepared for the worst.

Insect pests multiply as at no other season, so watch and spray; the two or three "green bugs" of today may be a multitudinous host tomorrow or the day after. It is best to stop this multiplication as early as possible. Fungous diseases also develop most rapidly under the stimulus so beneficial to all plant life, fungous or otherwise. Tobacco dust and sulphur are good materials to keep on hand for aphids or plant lice and for mildew, respectively.

In some sections high fogs prevail for days and then comes a very hot spell of cloudless skies. This sudden change works grievous injury to tender plants and often "burns off" seedlings at the soil surface. All plant growth will be benefited by a light sprinkling in early morn, preferably before sunrise. This morning bath is a great invigorator but must not be made to take the place of fundamental waterings or irrigations also so necessary during extreme "growing" weather. Abundance of water must be applied to all crops during April; to herbaceous garden plants it should be given twice each week. Do not leave seedlings too thick; thin out well—better one good plant than five weakly ones.

There is little use specifying what to sow or plant in April; it is essentially a planting time for hundreds of species and varieties in seeds and plants. All perennial roots that are beginning to make top growth may be transplanted either with or without division. It is now safe to put out the most tropical of plants, so do not restrict your gardening as to class, kind or fancied requirements; plants put out now will grow if they are ever to grow. Spring flowering bulbs, daffodils, etc., will be out of bloom but still keep them well watered, for now they make new bulbs, increase in size, and store vigor for next spring's floral effort. Only when foliage begins to turn yellow should you allow them to dry off. You may still plant bulbs such as amaryllis, cannas, callas, caladiums, gladiolus, hippeastrums, tuberoses and tuberous-rooted begonias. Do not forget yellow and pink callas. Bedding plants of all kinds should go out now, no matter what kind. If there remains any bare spot or spots in the garden now is the time to fill. No mistake can be made in April if we plant everywhere and everything.

Northern California

By A. R. Gould

THIS is the time to rearrange plants of all kinds, renew lawns or fertilize them, and here we might remark that even green grass needs a tonic and if you desire that fine dark green color on the lawn this coming season apply the commercial fertilizer now. We have often been asked to give hints on a good ground cover in place of grass for a lawn. There are two commonly used. Lippia makes a very good cover and should be planted two to three inches apart, using small sections. This will stand considerable wear and does not require the care and attention or the water that grass does. Then we have the wild strawberry which may be planted 10 to 12 inches apart. Both these should be planted in well prepared soil. For sloping ground these will be found very satisfactory or nesembryanthemum roseum will quickly give cover.

Climbers for the Trellis

Climbing roses: Banksia, white or yellow. Cherokee, white or pink. Marechal Niel. Reve d'Or. C. Bruner. Silver Moon. Climbing Sunburst, Testout or Beauty of Glazenwood. Passion vines are fast growers and Bignonia cherere, honeysuckle, clematis, ampelopsis, jasmine, mattress vine, Australian pea vine and cobea scandens. All should be planted in ground well manured.

Flower Seed To Sow Now

Asters; Comet, China and Cregos types, Stocks, zinnias, ageratum, nemesia, linaria, marigolds, scabiosa, phlox drummondi, lavatera, larkspur, clarkia and godetia, all free flowering annuals which will provide a display for summer and autumn. Sow these in fine sandy soil or a warm but shaded border at once. Sow very thinly in rows. Prepare beds and borders for planting these out later.

Dahlias

Secure tubers of these to plant out towards the end of the month. See that they have one or two "eyes" well sprouted before planting and prepare the ground by deep trenching with manure. There are now an endless number of varieties and they come in several types known as Show, Decorative, Paeony, Single Collarette Cactus and Pompom. They may also be raised from seed and some very interesting forms are obtained especially from hybrid Paeony and usually some fine single colors are secured. Seed must be sown in boxes of fine soil now.

Perennial Border

This may be added to and large clumps sub-divided and replanted. Secure new varieties of phlox, hardy aster and delphinium, all useful for cut flowers. Apply manure liberally and dig well in.

April in the Vegetable Garden

By A. R. Gould

WE congratulate ourselves on generous rainfall this season in our section. It has encouraged all and with careful management we should be well rewarded with good crops. Our planting list will be rather extensive and the work of preparing the plots by deep trenching and heavy manuring must be pushed forward and there will be also plenty of weeds to destroy before they begin to seed, hence it will be very necessary to keep the hoe moving.

Tomatoes

Having very carefully prepared the plot for these as we advised in our notes of last month and sowing the seed in a small hotbed everything should now be in order and by the middle of this month the seedlings may be put out at a distance of four feet apart. This is of course if you desire to have the plants ramble at will on the ground which is the method adopted by the commercial growers and is generally satisfactory. If you desire to have them climb and train them on the three stem system and grow select fruits then you may plant them closer at 2½ to 3 feet and as they grow tie them to strong sticks. In any case for the first few days after planting out, they must be protected from the sun until established. Plant firmly and water at time of planting. Strong plants may always be secured at this time of the most popular varieties, of your nurseryman. The varieties we recommend are Earliana, Chalk's Early Jewel and San Jose Canner. There are also the Red Cherry and Yellow types.

Lettuce

For succession sow Los Angeles in rows or broadcast very thinly on rich soil if you appreciate solid heads and keep this crop well watered. Any variety sown last month should be thinned or transplanted at least six inches apart.

Peas

Early varieties of this crop will have

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

We Californians, engaged in the everlasting grind of wresting a living from the soil, find it difficult at such narrow range to estimate the wonders of our own state. At bit of help in that direction is given on the cover of this issue. The census shows the nation's growth commercially, industrially and agriculturally every ten years. It not only shows it in the mass or aggregate, but even county by county. Official figures are not yet given out., but the agent of the Los Angeles chamber of commerce in Washington has secured a fund of information as to agriculture, which has been forwarded and is shown for Cultivator readers. Note that of the 12 highest counties in agricultural production in all America California has six and the state of Washington one, making more than one-half of the 12 highest on the Pacific Coast. Better than all, one California county, Los Angeles, was shown by the census of 1909 to hold first place as producer of agricultural crops and still holds this honor in 1919.

* * *

We believe the most helpful department of the Cultivator is that which has to do with the answering of questions coming to the editorial desk by every mail. Some of these ask as to legal information; others as to poultry; still others have to be referred to the veterinarian; and many go to various sections of the state to bring back to the inquirers just the line of information desired. And there are still others, almost without number, which are answered by letter or by sending former copies of the Cultivator which have answered similar questions. We urge continued use of this department; at the same time would suggest that where a complete file of the Cultivator is kept these last questions referred to may be answered with less of effort on the part of the inquirer by simply referring to the index of former volumes. But keep the questions coming; we will secure the answer if answer is possible. In this particular, however, we ask the subscribers not to be discouraged if the answer does not appear in first issue of the paper following mailing to this office. These questions have come so rapidly lately that it has been impossible to get all into our columns. Last week there were several columns for which we could not find space and fear the same is true this week, though it will be noted we have given liberally of space to that department.

* * *

Poultrymen are being tested out in these days of desperately low egg prices. Prices today are lower than for years and are coming desperately close to the two-bit mark. It is going to be a testing time for co-operating poultry people. Members of the Southern California Association will discuss the situation at an all day meeting and picnic to be held at Pomona next Tuesday. The payments on the authorized capital stock of the association have now practically reached the $100,000 mark.

* * *

The average price of plowland per acre in the United States decreased about seven per cent during the past year, according to a report just issued by the United States department of agriculture. The average value of plowland per acre on March 1 of this year was $83.78, as compared to $90.01 in 1920 and $74.31 in 1919. The statisticians of the department attribute the decline to the reduction in the prices of crops. The report shows that the heaviest drop in the price of land is in the Southern states where cotton is the principal crop. In some sections of these states there has been a decline of 30 per cent in the price of plowland during the year. Kentucky showed the greatest decline, from $70 to $53 per acre, approximately 24 per cent. Iowa shows the highest price of plowland, namely, $200 per acre. Western states show the least decline, and California, Oregon and Colorado show an increase. The valuations of plowlands in this state were $130 per acre, while this year the price quoted is $135.

* * *

The severest frost in years has visited almost the entire United States east of the Rockies. In much of the Middle West it was so severe that blossoms of trees and tulips and other early flowers were frozen stiff and blackened. No crop reports are in as to effect on fruit production, but it is feared that it may be very serious.

* * *

This is election time in many municipalities of California. This, perhaps, does not concern most Cultivator readers, and yet with the liberality of our cities in offering of their benefits to the rural portion of the community, many California ranches are within municipal boundaries, so we are suggesting "do politics"; be a factor in the community's upbuilding. At least in one particular Cultivator readers should be awake, that is, in the matter of school boards. The education of our young is often not considered of sufficient importance to cause a real wide awake looking into the canvass which is made to secure proper directors. Lots of Bolshevik ideas may be instilled into the minds of the next generation by teachers of today. Do we know who is teaching our children and the what and why of their instruction?

* * *

In remarking as above we are not in any way lessening the importance of home training. The homes of America are the true foundation of stable government. If home training is gone, all is gone. Notwithstanding that, we still insist that it must not be lessened by contrary teachings in our public schools. We must not only keep the home fires burning for the return of the boys from war but of the boys and the girls from their daily contact with many kinds of people.

* * *

And by home fires we mean a great deal more than the cozy glow that shuts out all the world and shuts in "Me and my wife and my son John and his wife." It must be also the clear, bright flame that illuminates the world and the peoples of the world, that teaches the children to read and to study and to think and to discuss and be strong to act when the time shall come for them to take their place in the world of doing. We can't investigate the teacher, make sure that he or she is orthodox and then sit down absorbed in what we call the everyday tasks and pass on our responsibility for righteous thinking and acting to the next generation. Never in all history were there such opportunities for enlightened citizenship as today, and it's up to us and to our children to move the world forward in the right direction.

* * *

The figures on the first page are rather gratifying to Californians. The best of it is they are not the only figures favorable to California conditions that can be given. Next week we will have some more information about one little corner of California. It will be a story about "The Richest Poor Farm in the World." We will tell no more this week, not even as to where this farm is located. Our readers may all have opportunity to guess meantime. But we promise some wonderfully interesting facts and photos.

* * *

Anaheim, Orange County, is now getting into full swing with the Valencia Orange Show scheduled for next month, May 17-21. Other towns of Orange County and of Southern California are uniting in giving a boost to a California wealth producer, the Valencia orange. It is expected there will be about 150 exhibitors.

* * *

It is possibly a little late for winter irrigation but it is not too late for just plain every day irrigation. The orchard which starts the season with its soil supplied with water to a depth of four or six feet will make a less frequent demand for irrigation when the hot days of July and August come.

HOW NEAR HOME ARE WE?"

John Burroughs, whose intense love for trees and flowers and birds has inspired all the world to make more intimate these friends, died on his way to his home on the Hudson from a winter in California, on Tuesday, March 29. On learning of the naturalist's death, Thomas A. Edison remarked:

"To me he always appeared to be one of the highest types yet evolved in the advance of men to a higher stage."

Mr. Burroughs' love for nature was only exceeded by his love of home. His last words spoken only a few moments before his death, as the train was speeding toward his home, were, "How near home are we?"

CAROB PLANTING

A few cents put into seed of the eucalyptus tree and a few of the seed put into a fertile soil may result in a great addition to our comfort and possibly to our wealth in later life. Where one has cheaply procured lands, which are perhaps not usable for more valuable crops, there is little question but that a profit may be secured in the planting of the carob, or the tree known as the St. John's Bread tree. The fruit of this tree is covered with a pod or husk rich in protein and sugar.

The time was when we had a wild scramble in planting eucalyptus trees. Corporations were organized and the promoter seemed to rule the state. Small wage earners invested their money in a bubble which soon burst. It takes time to produce a forest tree.

There are some indications that over-enthusiastic friends of the carob are coming close to the danger line. The Riverside chamber of commerce made careful investigation of the carob plantation scheme and its committee made report at a recent meeting, which could hardly be called a recommendation, to pay $400 or $500 per acre for carob planted land. The only advice the Cultivator has is investigate carefully before investing.

A CALIFORNIA SHOW

The California Association of Nurserymen will hold a plant and flower exhibition, in connection with their next annual convention, that is aimed to be the biggest thing of its kind ever held in the United States. It will not be a Los Angeles show or one confined to or participated in mainly by the south end of the state, but a distinctive California exhibit of statewide products. One of the largest plant firms in San Francisco will send a full carload of flowering shrubs. The Pasadena Horticultural Society will merge its autumn show with this one, which still further insures the largest and best.

Exposition Park will be the site and the sunken garden of seven acres will be utilized for one great flower garden. The cut flowers and rare plants will be staged in the patio of the state armory to the east. This space, 240 by 400 feet, will be covered with canvas, making the largest exhibit hall in the south end of the state. The convention dates will be October 20-21-22, with the exhibition including the 23d. The Los Angeles chamber of commerce, the county supervisors, the city park department and many individual firms and business men are back of this show to make it the biggest, most important plant and flower exhibit ever held on the Pacific Coast. It is expected that in 1922 one will be held in San Francisco.

The last rains came at a time when it was feared serious brown rot would be caused to apricot fruit just setting, but the drying and warm weather succeeding the rain is declared to have saved the day.

Hog Wallows Again

By D. J. Whitney

AN unsigned communication in your issue of January 22 adds much to the puzzling and interesting subject of the origin of hog wallows. If others have ideas on the subject, it will be pleasant if they also volunteer them.

I must plead guilty to the charge of knowing very little about tules. However, tules start readily on hog wallow land when given the opportunity—in other words, when given lots of water. It is just possible that the nature of the soil, being much heavier than the soil the correspondent mentions, enabled the tules to grow in small clumps. The tules the correspondent mentions grow on flat, peaty soil. Hog wallows normally are on sloping land. These ideas are given without knowing much about tules, and they have to be taken on that basis.

Another angle to the matter is that possibly some other kind of water plant was responsible for catching the sediment in the water and forming the mounds.

As to the theory that uprooted oaks formed the hog wallows, there are two objections to it. In the first place, it would take large oaks to form such mounds. Large oaks are widely separated, too widely separated for the closeness of the hog wallows. Also most of the oaks I have seen on such land have been rather small, much smaller certainly than those on the well watered loam of the flat lands.

In addition the hardpan underlies practically all of the land and it follows roughly the shape of the surface, though the mounds are flatter and the hollows more shallow. Consequently the hardpan would have to have been formed after the fall of the oaks. Theoretically it would seem that soil which would form hardpan would form it soon after the soil itself got in place and while the oaks were still there. However, as far as the whole subject is concerned it is easier to pick flaws in a theory than to think up even a poor theory. I cannot claim the credit for the theory of water formation described in an earlier issue.

This soil itself is very interesting. Although extremely fertile when well handled, it is so tight and compact, wet or dry, that it is quite barren in a state of nature. In many ways it is much like adobe, but adobe forms wide, deep cracks when it dries out. This stays tight as a drum and hard as a brick.

Tht following theory about the origin of the hardpan may interest readers. It is not original with the writer.

As water from rain sank in it dissolved and carried down from the upper foot or so carbonates, silicates and other soluble soil material. Then when the water evaporated these materials were left at the level at which evaporation took place. Some evaporation took place at the surface; some more several inches down, but after the top soil dried out the bulk of evaporation occurred at a level as deep as the soil texture would let the air work well. That level became the level of the hardpan because most of the evaporation took place there.

These soluble substances left when the water evaporated cemented the ordinary soil particles tightly together. Moisture from below gradually rose as evaporation continued, carrying with it the cementing material until the hardpan as we know it was formed. Any person who has to handle it wishes that this was not the case, but wishing does not help. Hard work and dynamite seem to be the only remedy.

If others can add facts or ideas of interest to this discussion, I hope they will do so.

* * *

Since writing the preceding a neighbor has suggested the following thought. We all know how dirt on the bed of a wagon will gather in little heaps when the wagon is driven over a bumpy road.

Similarly, this rancher thinks that when the world was young the soil may have been very loose and a series of heavy and long continued earthquakes possibly came along and shook it into the little hills and hollows we now find, climatic changes making a change in the texture of the soil. Such a change would have been necessary if this theory is probable, because the soil now cannot be shaken out of its natural form, wet or dry.

The whole subject is so interesting and puzzling that every additional suggestion ought to be of great value.

* * *

By L. C. Crossman

Lately I noticed a bit of theorizing on the origin of "hog wallows" in the San Joaquin Valley, and I venture to tickle the risibilities of the wise ones with the real solution.

The bed of Snake River today presents exactly the same conditions, but because that river very seldom overflows, leaving large mud flats like other rivers, these wallows are seldom seen, but there are places where the work can be seen, and the ripple whirlpools almost everywhere show that the bottom is full of them.

What makes them? Sturgeon. Now laugh, but that is exactly what does it. They root around on the mud flats for all the world like a big hog, and as monsters 10 to 15 feet long and weighing from 1100 to 1500 pounds are not so very uncommon you can readily imagine the wallows they can and do make.

I do not know that the San Joaquin was ever a great inland sea or mighty river, but if it was then the sturgeon, being a very primitve fish, so primitive that he has not even yet developed a bony skeleton, would surely be there in vast numbers, and likely running from 500 to 2000 pounds or more.

West of Delano are many of these hog wallows that nothing ever piled up save something that could root just like a giant hog, and they have no resemblance to the wind dunes of the Imperial Valley.

THIS YEAR AND LAST

A study of the jobbing price of a few of the leading fruits and vegetables as reported by the United States bureau of markets for the first week in March this year as compared with the corresponding week last year is of vital interest at this time.

Take for example potatoes which ranged in ten of the biggest receiving markets of the country this year $1.50-$1.60 per 100 pounds. Last year they were in the same markets $5.50-$5.75.

Sacked onions per 100 pounds this year 75-90 cents and last year $5.75-$6.00 in the same market.

Old storage cabbage per ton this year is jobbing at $18.00-$20.00. Last year it was bringing all the way from $90.00 to $100.00 per ton.

That a corresponding drop in the retail prices of these commodities has not been apparent to the ultimate consumer is due to several causes. Many retail grocers have taken heavy losses on canned goods and on dried fruits and are still selling these items at a loss. They see a chance to cover part of this by holding out for the old price on more perishable vegetables which cost them very much less in a wholesale way than a year ago.

Then too it must be admitted that their cost of doing business has declined little if any and that the consumers themselves are still not buying with as much discrimination as they might. With the keen competition between retailers, the consumers have the power in their own hands to realize these declines in wholesale prices whenever they choose to shop around instead of ordering their supplies over the telephone, having them delivered and the bill charged to their account. —H. H. W.

The lettuce movement from the Imperial Valley is practically over, with a few cars of rather poor quality still to go forward. In spite of the higher freight rates very few fields were plowed under and while the growers scarcely averaged the cost of production, the fact that the market warranted the movement of the entire crop was a surprise to all interested in the deal.—H. H. W.

Gill

One-piece Piston Rings

keep spark-plugs clean

because: they are ***individually*** cast from a special gray iron that resists the ravages of heat and retains its elasticity through the most trying piston ring service; because they maintain unfailingly a snug, all-around, leakless contact with the cylinder walls through thousands of miles of usage; and because they have a leakless joint that stays leakless.

Oil does not work up past Gill One-piece Piston Rings; and as a result spark plugs are kept clean.

RUMELY OilPull TRACTOR

Unbeaten Tractor Economy Records

When you get ready to buy your tractor, remember this—a Rumely OilPull tractor has won every tractor fuel economy record during the last nine years.

That's a tremendously significant fact for every tractor buyer and is backed up by facts.

From the Winnipeg Tractor Contest in 1912, when an OilPull tractor established a record of .7 pounds of fuel per H. P. hour, to the last official test in 1920 at Columbus, Ohio, where the OilPull brought its record figure down to .606 pounds of fuel per H. P. hour, every test has proved the OilPull a winner.

And the same economy maintains on the farms of OilPull owners everywhere. The OilPull operates satisfactorily on unusually low grades of fuel, including stove tops so easily available in California.

The tractor owner who can use stove tops makes a saving of 10c a gallon over kerosene. If he uses an average of 20 gallons a day for 200 days a year, he saves $400 a year, $2000 in five years, $4000 in ten years—that's real economy!

However, unequaled economy is but one of the OilPull features that recommend it to you. The OilPull catalog tells the whole story. Send for a catalog.

Farm Bureau Announces Wage Scale

At the recent meeting of the board of directors of the Los Angeles County farm bureau, Director Aschenbrenner, chairman of the labor committee, presented a report on the activities of the farm bureau relative to the labor situation and reduction in wage scales. Originating in the El Monte center, the movement for establishing a standard scale of wages has spread from center to center until at the present time a dozen or more have wage scale committees actively at work. A number of these centers had representatives present at the last meeting of the labor committee, at which time an effort was made to outline a recommended wage scale for the different agricultural districts of the county.

After a great deal of discussion and deliberation, and after consultation with a representative of the public employment bureau maintained in Los Angeles, the committee made the following recommendation as to a reasonable and just wage scale:

For Citrus Districts

Unskilled labor, 35c an hour; teamsters, 40c an hour; tractor operators, 40c to 50c an hour; pruners, 50c an hour; tractor work, $2.00 to $2.25 an hour; team work, $7.00 to $7.50 per nine hour day.

For General Farming Districts

Unskilled labor, $2.00 to $2.25 per day and board, or $40.00 to $50.00 per month and board; ranch foremen, $75.00 to $100.00 per month with house.

It is recognized that there will be slight differences in different districts and that these will necessarily have to be taken into consideration.

The above recommended wage scale is offered as a means of stabilizing the labor situation in different parts of the county. It is suggested that farm bureau members and farmers generally adopt the wage scale recommended and use the farm labor associations which are being organized in various parts of the county through the field department of the California Fruit Growers' Exchange, as a means of supplying needed labor. Such an organization exists in the San Gabriel Valley and one is now being organized in the San Fernando Valley.

The committee also desires to call attention to the fact that the labor supply is ample at the present time and all indications point toward there being plenty for the coming season. The committee suggests and recommends that farmers become better acquainted with the service rendered by the Public Employment Bureau, 212 Franklin Street, Los Angeles.

Orange County Avocados

By Ernest Braunton

THE writer spent a long day last week in the canvass of several of the many avocado orchards in Orange County. More time was consumed in the C. E. Utt orchard near Tustin than in any other. Here are a variety of named trees but mostly of Sharpless and Taft. They are eight years old and of course the latter variety is just coming into bearing.

In an interview with Mr. Utt he stated: "While the Taft is slow in fruiting, so slow I would not now plant a new orchard of it, it is a most excellent fruit, and when once the yield starts, is steady and sure. While several excellent varieties fruit heavily one year and have practically none the next, the Taft bears a fair crop of high grade uniform fruits every year and they command top prices." In warm localities, where frosts are not severe, and where the home orchard will afford space for a variety, a Taft tree should find a place. It is "slow, but sure." Mr. Utt, being a man of large and varied interests, cannot bother with the work of handling his own avocados, so sold the crop in this mixed orchard for the year 1921 for $5,000. Just the acreage the writer does not know but it appears to be ten or twelve.

One piece of information obtained was most pleasing for it has been a leading question: "What returns do the growers receive?" These are facts: One prominent grower, who is sometimes known as "the grand old man" of the avocado industry, sells his entire 1921 crop (largely Fuerte) to a Los Angeles hotel for 72 cents a pound. Another grower has sold his for 80 cents a pound and has taken $300 worth from one tree. The Cultivator is not predicting that such prices will permanently obtain or even last another year, but the trees will yield no less and the reader may make his own prospective computations. The present profits certainly are satisfactory.

Aside from Wilson Popenoe, the plant explorer for Uncle Sam, E. E. Knight of Yorba Linda is the only man to go to Guatemala for the specific purpose of getting budwood from the best varieties of avocados. He secured five which were budded into Mexican seedlings and were named: Queen, Linda, Knight, Kist and Rey and have found favor with commercial growers in the order named. The marked exception is the Rey, which is of little value. The Kist is not a good variety for commercial planting and the seed is too large compared with the amount of flesh present. The three others are of high grade and each year are finding more favor with experienced growers. Of these the Linda is the larger, the largest in fact of all avocados grown in California. Mr. Knight says J. T. Whedon, also of Yorba Linda, and the pioneer avocado grower of Orange County, produces the largest and best Lindas. W. A. Spinks of Duarte has several hundred each of the three leading Knight importations and has the best trees and fruits of the Knight variety. Queen has so far proved the better in yield. Mr. Knight is this year budding over 140 of the worthless Rey to Queen and Linda. The latter has been thought by some to be too large, for under intensive cultivation fruits have been produced that weighed more than four pounds each, but with mature trees and as grown by Mr. Knight the fruits average about one and a half pounds each. It becomes more evident each year that we do not yet understand the adaptability of variety to soil, climate and general conditions. Results are quite variant throughout the avocado orchards, and more light, based on experience, is needed for intelligent planting.

THE NEWER AVOCADOS

The last report of the committee on registration and classification of varieties of the California Avocado Association, under the head of "new varieties," states:

"The Queen and Dickey A are the leaders among the new varieties, but we have only one season's fruit from which to test the first and a limited experience with young budded trees of each kind.

"The Queen is rich in flavor, excellent in quality and notable in beauty of appearance of the flesh when cut. The tree is of a somewhat spreading growth. The ripening period is early summer; the seed medium to small for the large fruit, color dark red to dark purple; shape pyriform, slightly corrugated; skin thick, granular and brittle. Flesh, rich clear yellow, changing to beautiful dark green next to skin, and with no fiber.

"The Dickey A is a spring fruit; it is hardy, promises well in prolificness, and the quality of the fruit is extremely good. The weight, 12 to 18 ounces; seed very small, 1½ to 2 ounces; color, dark red to purple."

AVOCADO: FLOWER TO FRUIT

Many inquiries come in as to the time elapsing between flowering and maturity of avocados. One year may be accepted as the minimum time and this holds good for the Mexican or thin-skinned section only. Even the

48,000 ACRES
SAN LUIS OBISPO CO.
Under arrangements just completed with C. W. Clarke Co., the owner of the well-known Sacramento and other ranches near Paso Robles, I am now in a position to offer for sale in nine subdivisions ranging from 1,000 to 8,500 acres, the 48,000 acres owned by said company, at prices ranging from $18.00 per acre up, and on favorable terms.
These ranches are situated about fifteen miles east of Paso Robles, and included in their areas are thousands of acres of fine land suitable for cattle or general farming, almond growing or other fruit raising.
For further particulars, apply to
WALTER I. BRUSH
Supt. Sacramento Ranch near Shandon, S. L. O. Co., P. O. Address Paso Robles or Shandon. Tel. Paso Robles 6-F-1.

preferred Puebla, in cold heavy soils, will occasionally run to 14 or even to 15 months. The range of 12 to 18 months will cover all known varieties. It is believed the Sharpless requires the full 18 months but Dickinson and Spinks will run 15 to 18 months, time determined by soil, climate and treatment. Fuerte, Queen, Linda and other standard varieties range from 13 to 16 months from flower to fruit.

SEEDLING AVOCADOS

In Tustin, Orange County, there are numbers of large seedling Mexican avocado trees planted along the streets. These are of poor type, except two or three, many not fruiting at all and the others bearing few fruits of little value. One of the best was mentioned in the Cultivator some months ago as fruiting well in September 1901. C. E. Utt says this, with the others, was planted 28 years ago, or in 1893.

QUICK DEATH FOR CUTWORMS

Cutworms are reported to the United States department of agriculture as making a clean sweep of the wheat lots on the experiment farm of the department's dry land agricultural project at Woodward, Oklahoma. The cutworms are of the species known as the granulated cutworm.

Poisoned bran bait is the specific remedy for cutworms. The accepted formula is wheat bran, 50 pounds; Paris green or crude arsenic, 2 pounds; black strap molasses, 2 quarts; water, 2 to 4 quarts or more as needed. Mix the bran and poison thoroughly in a dry state, then add the diluted molasses, and stir vigorously until thoroughly mixed. Distribute the bran over the infested field broadcast, taking care to sprinkle it sparingly around each hill. Middlings or alfalfa meal may be substituted for bran.

KEEPING DATES

This has nothing to do with engagements or appointments, but with fruits of the date palm. While in Coachella Valley recently the writer ate heavily of dates for several days. Those of common varieties were either dried or in airtight glass container. The latter, sterilized and confined in September, were as fresh and juicy in February as when gathered from the palms. A variety of seedlings from the well known Menakher date were dried and make excellent "chewing dates," but no others in this respect are of such high quality as the Asharasi, the best dry date the writer has eaten. Many date growers have their own curing houses and several cooperative packing houses have been built.

The Coachella rancher is extremely optimistic and of the many offshoots available from many plantations not one is for sale, each grower wishing to extend his own date acreage as much as possible. This is a hopeful sign and full of promise for future dates.

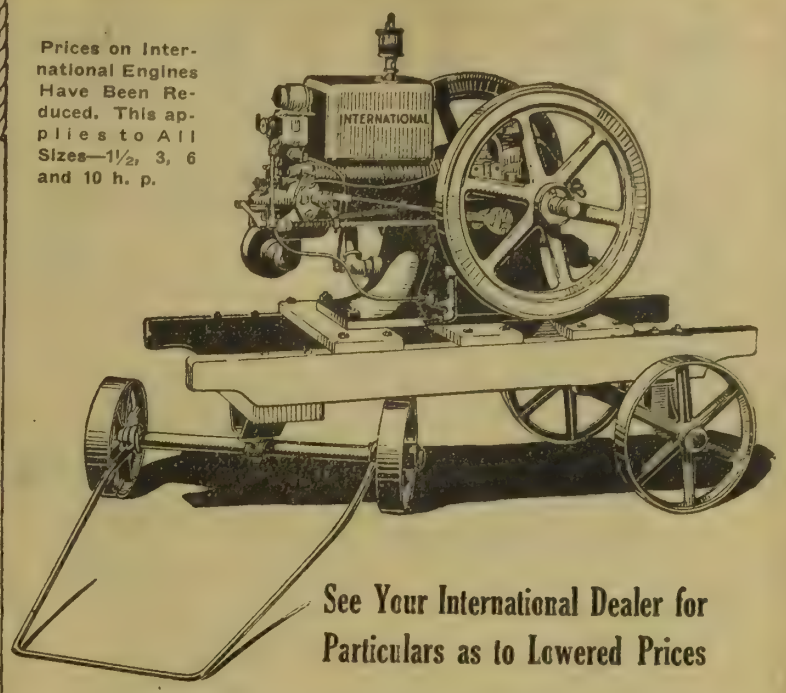
FLOWER SHOW PRIZES

In the 1921 schedule of the Massachusetts Horticultural Society for cash prizes awarded to flowering plants and cut flowers, the total for roses is $4576, and for chrysanthemums $1841, more than half of which sums are for flowering plants. In flowers alone gladiolus leads, with $466, carnations next, with $290, and peonies third, with $105. Orchid plants in bloom are to be awarded $850 and cut orchid flowers $150. Of course all orchids are grown in hothouses, so are not in the same class as the other plants and flowers listed.

FIGS FROM SPAIN

The United States vice consul at Huelva, Spain, reports an enormous crop of figs and chestnuts for 1920, far surpassing that of 1919. The shipments of chestnuts to the United States during the past year show a material increase, but fig shipments to this country were very light last year. The cause of the decrease lies in low price, an indifferent demand and a drop in the value of the Spanish peseta, the latter amounting to nearly 50 per cent.

Prices on International Engines Have Been Reduced. This applies to All Sizes—1½, 3, 6 and 10 h. p.



See Your International Dealer for Particulars as to Lowered Prices

SEVERAL factors help to explain why *International Engines* are popular wherever they are used. But the most prominent reason is that they do the work their owners want done when it should be done.

International Engine owners know that if there is feed to grind, the International will do it. If there is water to pump, the International will pump it. The same is true with wood sawing, churning, chopping feed, fanning grain, etc., etc. The International will turn the trick, when you give it a chance.

In accomplishing this, *International Engines* use low-grade fuels. They are simple to operate—many farmer boys not yet in their teens start and operate International Engines with ease.

International Engines have built-in magnetos, replaceable cylinder liners, enclosed crank cases. They are hopper-cooled, and have many other valuable features. Made in 1½, 3, 6, and 10 h. p. sizes.

Send a postal for an engine pamphlet.

THIS MONTH IN THE VEGETABLE GARDEN IN NORTHERN CALIFORNIA

(Continued from Page 449.)

been picked and those sown for succession will be now coming in. You should sow every three weeks for a time to keep a fresh supply. Such well tested varieties as Little Marvel, Laxtonian and Stratagem should be planted. Make a sowing now and sow thinly. If you have a surplus they may be collected and kept in the dry state for use during the winter.

Carrots

Make a sowing at the end of the month on rich soil of French Forcing and Danver's Half Long. Sow in rows 18 to 20 inches apart very thinly. After the rains are over these will need irrigating at least every two weeks.

Squash, Muskmelon and Watermelon

These should be sown, three or four seeds to a mound which should be well prepared with manure. Place four feet apart each way. Water the seeds immediately after sowing. There are many squash and pumpkins in cultivation and we dare not mention them all but the best are: Hubbard, Early White Bush Scallop and Boston Marrow. Pie pumpkins are Morse's Marrow and California Field which grow to a considerable size. Vegetable marrows are also very popular. Of these there are both green and yellow varieties. Excellent muskmelons are Persian, Bay View, Honey Dew and Golden Beauty casaba. Watermelons; Georgia Rattlesnake, Kleckley's Sweet and Chilian.

Cucumbers

Follow the same cultural methods as advised above for squash, etc., and sow the following varieties in well manured mounds; White Spine, Long Green and Lemon. The last named is shaped like a lemon and has of late years become very popular as it has an excellent flavor and quickly matures.

Onions

Complete the thinning out of this crop and leave the plants six inches apart in the row. Transplant seedlings to well prepared beds. Dried onions are easily stored through the winter, hence it will be advisable to make an increased planting. As the plants become established cultivate frequently through the rows.

Corn

Sweet corn is always a popular dish and several sowings should be made throughout the season to have it fresh. Make a sowing the middle of the month of Country Gentleman, Golden Bantam and Golden Cream. Sow three seeds in a group three feet apart each way in rich soil. Field corn may be sown under the same conditions and we recommend Yellow Flint, Leaming and Golden Dent.

Beans

During this month we can sow the more tender varieties in rows, 20 inches or more apart. The best pole varieties are Kentucky Wonder, Golden Cluster and Horticultural. The dwarf are Stringless Green Pod, Golden Wax, Refugee and Davis White Wax. Another sowing of Canadian Wonder may be made.

Egg Plant and Peppers

Sow in boxes seeds of Black Beauty egg plant and Chinese Giant. Pimiento and Red Chili peppers, or strong plants may usually be secured from your nurseryman.

Beets and Swiss Chard

If seeds of these were sown last month as advised the seedlings will need thinning out to six or eight inches apart.

Turnips

Sow very thinly Early Snowball and Purple Top in richly prepared soil.

Celery and Leeks

Seeds of both should be sown in boxes of fine soil and placed in a warm situation. Golden Self Blanching and White Plume are very fine flavored varieties of celery and American Flag and Musselburgh are excellent leeks. Trenches 18 to 24 inches deep should be dug and well manured for planting out these two very desirable vegetables.

Parsley

Sow double or Moss Curled in rows thinly for late use.

Southern California

By D. F. Reichard

THIS has been an ideal spring for the garden. The weather has been mild and the rain gentle and generous. These make for good growing conditions. For those who have not been able to get a garden started we can say, "Do t now." Work up the desired plot and get it into shape to receive the seed as soon as possible. This is the last month in which one can successfully get a garden started.

In the gardens that are already started keep diligently after the weeds and cultivate thoroughly. Also cultivate any unplanted ground in order to keep it in perfect mulch that the moisture may be retained and to destroy weeds.

The ground is warm enough now so that plants and seeds in all lines may be put out. Set out plants of tomatoes, peppers, egg plant, roselle and sweet potatoes. Sow seed of sweet and field corn, cucumbers, melons, okra, pole and bush beans, summer squash, also winter squash, roselle or jelly plant. Besides these tender things put in small plantings of the hardier vegetables such as carrots, beets, radishes, turnips, spinach, Iceberg lettuce, onions, parsley, parsnips and the like.

Watch all growing stuff for insect and fungus attacks. The plant lice are usually bad this month and next. Get after them with Black Leaf 40 diluted as directed. Thin out all young plants that they may get their proper growth.

Southern Arizona

By M. E. Bemis

LESSENED activity in planting and increased cultural activities mark the month of April for southern Arizona. The list of plantable things narrows as the warm season advances, and with the coming of warmer weather evaporation increases and the necessity for cultivation and irrigation increases.

Asparagus roots, sweet potato plants, tomato and pepper plants may be set in the open ground. It seems at this date (April 24) that there is not much danger of late frosts. At any rate we have had so little cold weather and there is so small an amount of snow on even the highest mountains that it does not look as though there would be any late frosts to do damage to tomato or other tender plants that may be set now.

This year of all years the garden should mean more to the farmer than any other. With doubtful values attached to future farm products of all kinds, the home living assumes a greater importance relatively than ever before.

It is not too late to make a beginning in gardening even though no preparations have yet been begun. Tomatoes enter to a very large extent into the living of many families, and this is the ideal time to get busy and prepare the land for a few plants and then buy them and put them out. The varieties that do best are readily obtainable at the seed stores. Beets, melons, cucumbers, pumpkins, radishes, and squash may be planted for main crop or for succession.

Peanuts, while not strictly speaking a garden crop, have their distinctive place on every farm, unless it be in the extremely heavy soils. Peanuts are coming less and less to be regarded as a luxury and more and more as a necessity. Their food value is becoming better known, and possibly the time is not far off when peanuts will be regarded as a staple crop quite as much as potatoes.

A difficulty experienced here is in obtaining a stand. Good yields are usual if there is a fair stand. They should be planted in rows three feet apart and 20 inches apart in the row. About 15 pounds of peanuts in the shell are required for one acre The

Virginia Bunch is probably better adapted to southern Arizona than the Spanish or any other variety. They should be irrigated frequently during the growing season and a cultivation should follow each irrigation as long as possible to get through the rows without injury.

GRAPEFRUIT CULTURE IN THE IMPERIAL VALLEY

(Continued from Page 447.)

practicable, not that the trees fail to survive but that the crops are unsatisfactory either in amount or quality or both.

And not only does the Imperial Valley offer the above mentioned advantages as a grapefruit district but in point of yield and in size of fruit it compares favorably with other districts. Contrary to the expectations of some, the yield as above mentioned is not noticeably smaller than in other districts. A seven year old tree carrying 15 picking boxes of fruit would certainly not be considered as a poor crop. And that is what the writer observed on one of the older orchards. And the size of fruit was splendid, not too large and not too small, the ideal size for serving in the half.

Having devoted some little space to discussing the advantages offered by the valley as a grapefruit district, it is only fair to deal briefly with certain of the difficulties encountered and some of the problems confronting grapefruit growers in the valley.

The problem of establishing a grapefruit orchard in the Imperial Valley is a more difficult one than in the more favored citrus districts of other parts of the state. Mistakes have been made in planting in too cold districts where the trees are frosted back frequently. Orchards were seen where the trees had been killed back below the bud union, some having been entirely killed out and others coming out from the stock. Undoubtedly extra care is necessary in order to satisfactorily establish an orchard. Among the factors contributing to successfully establishing an orchard, and which should receive attention from Imperial Valley grapefruit growers, are early planting and protection against both sunburn and frost. Earliness in planting is extremely desirable in order to gain the largest possible growth the first season as a means of successfully wintering the first year. Late February or March seem to be the best months for planting. Protection against sunburn by both whitewashing and protectors would seem to be a precaution well worth while. And wrapping the trees with cornstalks, tule, or other protective covering during the first two or three winter seasons is to be advised. After passing the third year the trees may be expected to be able to stand practically any cool weather which may occur.

The irrigation problem is one on which there seems to be little agreement and a consequent wide variety in practice. In the absence of winter rains it is of course a foregone conclusion that irrigation throughout the entire year is a necessity, although in order to harden up the trees against frost injury it will probably prove advisable to cut down on water during the late summer and early fall months. Winter irrigation, however, in preparation for the spring bloom should not be neglected, in the writer's opinion.

The period elapsing between irrigations and the length of the furrow, as well as the time the water is allowed to run in the furrows, will of course depend very largely upon the soil. In the heavier soils the periods will of course be longer, as will also the length of furrows and the length of time in the furrows, than is the case in the lighter soils. With the high evaporation, however, the periods between irrigations should probably not exceed five weeks even in the heavier soils, and in the lighter soils should very likely not exceed three weeks at most. The use of deep furrows is also to be advised as encouraging penetration of irrigation water.

A problem already causing considerable anxiety is that of the compacting of the heavier soils with the formation of very tenacious and practically impervious plowsoles. This seems to be due to at least two principal factors, the natural formation of many of the heavier soils and the infiltration occasioned by the use of irrigation water carrying large quantities of silty material. The use of tools giving a compacting effect, such as the disk harrow, is a contributing factor to this condition. In the opinion of the writer this constitutes a major problem for orchardists located on the heavier soil and furnishes the principal reason why only the lighter soils should be selected for grapefruit culture. Subsoiling at frequent intervals, deep cultivation, avoidance of packing implements, and the growing of deep rooted cover crops may, and probably will, aid in overcoming this condition, but it undoubtedly will continue to furnish a most vexatious problem for the Imperial Valley grapefruit grower who has planted his trees on the heavier soils.

With naturally fertile soils and using irrigation water which each year adds its increment of silt, the problem of fertilization has not as yet been given much attention. It is doubtful whether surface application of manure will accomplish much under the intense dry heat which prevails in the valley. Plowing such material under deeply in late fall or applying it in deep furrows will undoubtedly be found to give better results.

Pruning does not present a serious or difficult problem. Such treatment should be primarily a judicious thinning of the outer shell of foliage so as to encourage a greater production of inside fruit, and raising the trees up from the ground to permit of cultivating and furrowing underneath. In thinning care must be taken not to unduly expose the interior branches to direct sunlight, else sunburn may result.

Undoubtedly grapefruit culture in the Imperial Valley is destined to become an important industry. With many natural advantages in the shape of low production costs, earliness, and unusual quality it can hardly fail to achieve a notable success. That others feel similarly toward its future is evident from the fact that large plantings for the coming season are contemplated. The writer was recently informed by a prominent Los Angeles fruit grower of his placing an order for trees for 80 acres, to be set a year from the coming spring.

CALIFORNIA IS JUSTIFIED IN BOASTING

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Asparagus and Cyclamen

Please tell me how to propagate asparagus plumosus. Can it be grown from cuttings? Please tell me how to grow and care for cyclamen. Should they be kept in a shady location and very damp? How should they be fertilized? Can plum trees be grown from cuttings? If so, how and when should the cuttings be planted?—Subscriber, Bakersfield.

Hardly any truly bulbous plant may be grown from cuttings (the dahlia is tuberous), and asparagus belongs to the lily family. Propagation must be by seeds or by division of the clumps of roots. Cyclamen should at all times be grown in shade, in very well drained soil yet kept moist. Tops of bulbs should be exposed, not buried in the soil. Keep growing for 60 days after blooming and rest by allowing bulbs to dry and tops to die. Then store in cool, dry place until autumn. Mix well decayed manure or commercial fertilizer most thoroughly with soil before replanting. Plums may be grown from cuttings but not readily and resultant young trees are weakly. Bud or graft.

Buried Pomegranates

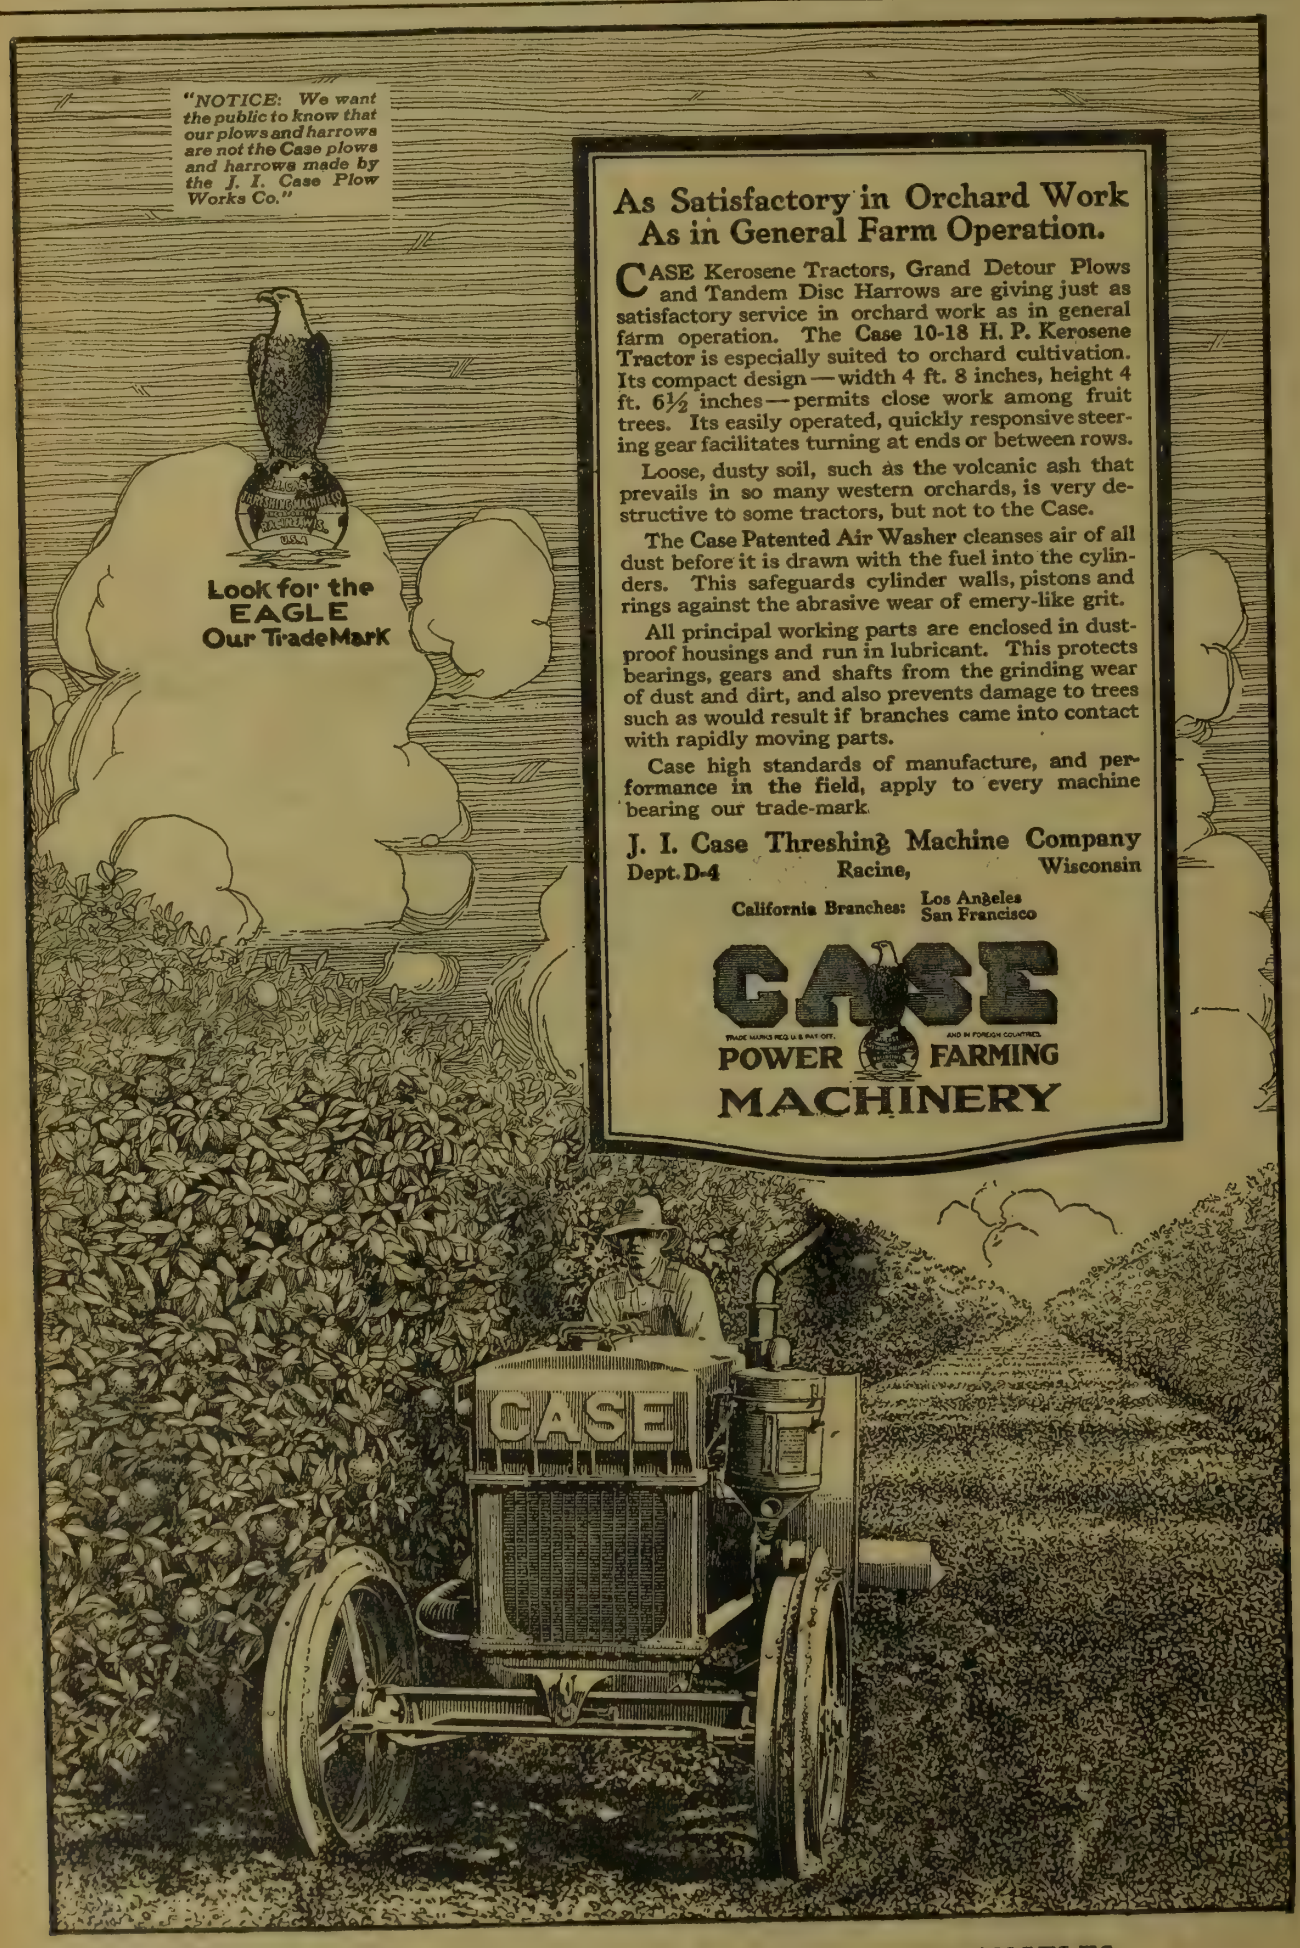
Have some pomegranate trees which were buried about a foot deep with a flood of good rich soil from the hills, and would like to know if this will kill the trees or cause any disease as in the case of citrus trees. They were buried over a year ago and seem perfectly healthy.—Subscriber, San Fernando.

Pomegranates will suffer no harm from such treatment and will need no irrigation during present summer, as they are naturally very drouth resistant.

Pure Breds—Thoroughbreds

I wish information regarding thoroughbreds. You know there are many different thoroughbred varieties of the different domestic animals which have been bred up from the wild breeds, said varieties consisting of a cross-breeding of other varieties, as for instance, the Rhode Island Red breed of chickens which consists of a cross-breeding of dunghill fowl, of Leghorn, Malay Game and other blood which I can't call to mind just at the moment. But as I understand it, it takes just so many different strains of blood derived from a certain method of cross-breeding to make a thoroughbred. Now let us say, for instance, I wished to breed for a certain new thoroughbred strain of hogs. Just how would I go about it? What crosses should I make? How many and in what manner to secure a new thoroughbred breed of animals? This is the point I am after.—Subscriber, Paradise.

Before answering the direct question we trust our subscriber will pardon us for a few words regarding thoroughbreds and pure breds, for by the words we use we express or carry to others correct ideas. Strictly speaking and in its original sense the word Thoroughbred applies to "The English Thoroughbred, a race or breed of horses kept chiefly for racing (running) with an old recorded ancestry of unknown origin, probably oriental or Arabian and Turkish breed. The American Thoroughbred is practically identical." From the inquiry we take it that our Paradise subscriber wishes to know regarding poultry, so on this particular point we turn to "Poultry Production" by Lippincott and we find there that "In poultry terminology 'pure bred,' as used in reference to farm animals, is, technically at least, replaced by 'Standard bred.' The term 'pure bred' implies that a complete record of the ancestry of the individual considered may be traced back to the individuals that are looked upon as the foundation animals of the breed, without admixture of alien blood." "The term 'standard bred' implies that in breeding practice only those individuals have been mated which conform closely to the 'standard'." Then in a short note this: "The term 'thoroughbred' is frequently used in describing standard bred poultry. 'Thoroughbred' is a proper name and refers to a breed of horses. It is as inaccurate to speak of Thoroughbred chickens as it would be to refer to Plymouth Rock horses." Now we are not referring to this in order to secure pure English but simply to get on a common ground so as to make ourselves clear, and in this matter of the term "standard bred," as applied to poultry, Lewis' "Productive Poultry Husbandry" takes identically the same ground save that he seems to prefer "pure bred" stock as applied to poultry. However, on carefully reading the above query it appears that there is desire for information as to the production of another breed than now exists. If such is the desire then a long, long trail is before the experimenter. The first question to answer is: What is the desire in the new breed that is to be produced? That will answer the subscriber's one question, "What crosses should I make?" These crosses will depend entirely on the ideal in the mind of the breeder. What characteristic does he intend to bring forth in the breeds now in existence? Then the two birds should be chosen which come the nearest to the ideal. If the breed to be created is to be a single comb, is to be white or black, is to have a large quantity of white meat or a large capacity for laying, these points are to be considered in the selection of the foundation stock. The stock selected the first generation will probably show much of disappointment, but the best from this generation should be chosen (by best we mean those which come the nearest to the ideal of the breeder) and another cross to be made with still another bird in the hope of securing still closer conformation to the ideal.



"NOTICE: We want the public to know that our plows and harrows are not the Case plows and harrows made by the J. I. Case Plow Works Co."
Look for the EAGLE Our Trade Mark
As Satisfactory in Orchard Work As in General Farm Operation.
CASE Kerosene Tractors, Grand Detour Plows and Tandem Disc Harrows are giving just as satisfactory service in orchard work as in general farm operation. The Case 10-18 H. P. Kerosene Tractor is especially suited to orchard cultivation. Its compact design — width 4 ft. 8 inches, height 4 ft. 6½ inches — permits close work among fruit trees. Its easily operated, quickly responsive steering gear facilitates turning at ends or between rows.
Loose, dusty soil, such as the volcanic ash that prevails in so many western orchards, is very destructive to some tractors, but not to the Case.
The Case Patented Air Washer cleanses air of all dust before it is drawn with the fuel into the cylinders. This safeguards cylinder walls, pistons and rings against the abrasive wear of emery-like grit.
All principal working parts are enclosed in dust-proof housings and run in lubricant. This protects bearings, gears and shafts from the grinding wear of dust and dirt, and also prevents damage to trees such as would result if branches came into contact with rapidly moving parts.
Case high standards of manufacture, and performance in the field, apply to every machine bearing our trade-mark.

and so on through almost unending years when a breed may become established because of its persistence in breeding true to the ideals. Then it becomes standard bred, or better perhaps, pure bred, and in the future pure breds of that particular type can be proven only by tracing back to the original or foundation stock. The common or mongrel fowl may possibly have been used in building up these new strains or breeds, but as a rule pure breds are preferred because they have thoroughly established traits, the reproduction of which may be depended upon. This matter of creating a new type calls for long time and extreme patience. We are reminded of a remark of David Starr Jordan made before the fruit growers convention held in San Jose nearly a score of years ago. Mr. Jordan's address touched upon plant breeding and as to the power of the human in directing and securing accomplishment through breeding, he asserted that it would be possible to breed a lap elephant, starting with the present species and breeding from generation to generation with the one idea of size similar to milady's lapdog. Dr. Jordan said this would require some time, perhaps six or maybe eight thousand years, but if he could be given the time he knew this could be done.

Mushrooms

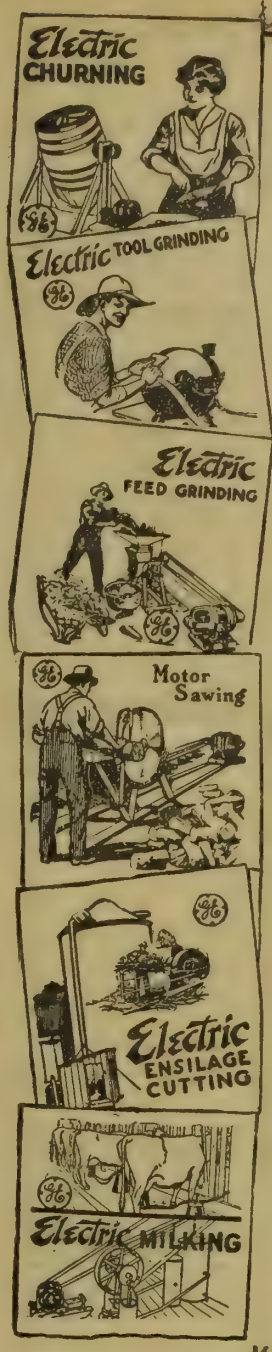
I am sending sample of mushrooms which grow in a field fertilized with stable fertilizer. There are edible mushroom somewhat similar to these, growing there, and I wish to know if this is an edible variety. I can find no description of it in any book I have.—Subscriber, Garden Grove.

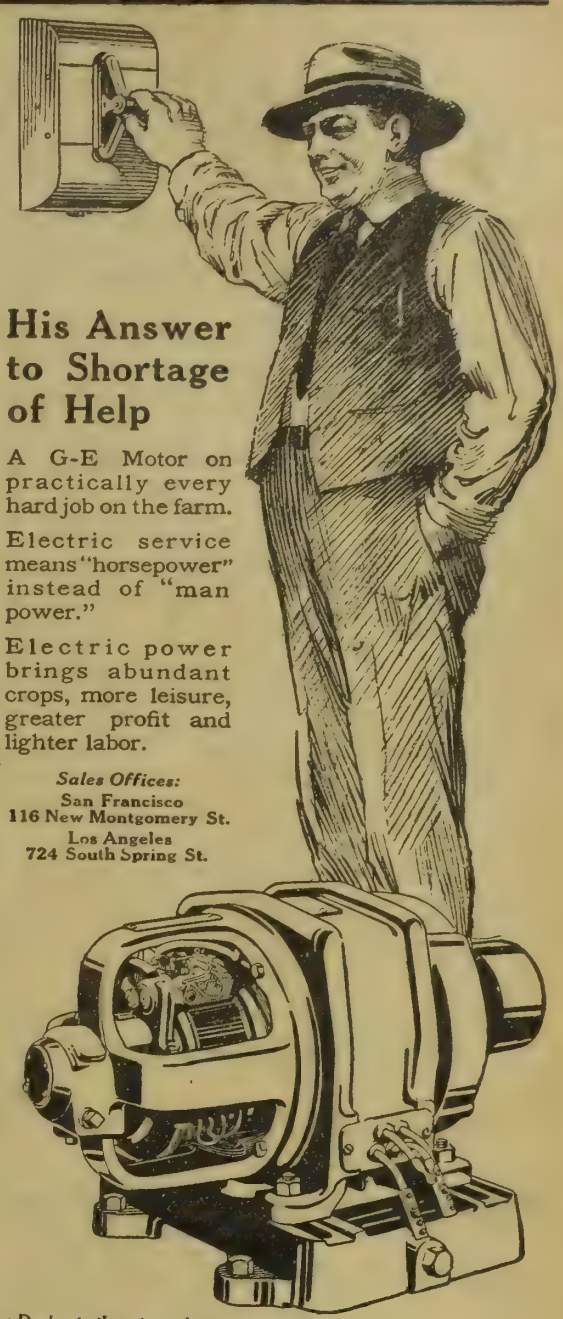
We are not sufficiently expert on mushrooms to give assurance to anyone else. The specimens sent were somewhat wilted and had lost the freshness of the meadow, but they had every appearance of the true meadow or edible pasture mushroom. We believe the scientist calls it Agaricus campester. They have the regular pinkish brown "gills," thin, tender buff or slightly brownish mottled or creased skin on top. They seem identical with those of which we have eaten bushels. However, here is a suggestion to our would-be mushroom eaters. Secure a copy of the National Geographic Magazine of May 1920. On pages 387 to 439 are given particular descriptions not only of edibles but of the toadstools containing the deadly poison. It is the most complete collection of information on mushrooms we have seen. We presume any public library has this mazagine. In addition write the Agricultural Experiment Station, College of Agriculture, Berkeley, and ask for Circular 84, "Mushrooms and Toadstools." This is only a four page circular and has no illustrations but has a number of suggestions regarding mushrooms.

Root Knot

I have French prunes, Tragedy plums and peaches and I find that a black knot forms just below the surface. Some tell me it is called black root and the tree should be dug up and the ground disinfected for one year. Others tell me to clean it off and apply Bordeaux. Please put me on the right track.—Subscriber, Porterville.

If the root knot is entirely circling the tree at the ground or just below the surface of the ground it would probably not be worth while to cut away and try to save the trees. However, where the infection is just starting chiseling off of the diseased knotty excrescence until one reaches clean healthy wood and then painting the wound over with Bordeaux





His Answer to Shortage of Help

A G-E Motor on practically every hard job on the farm.

Electric service means "horsepower" instead of "man power."

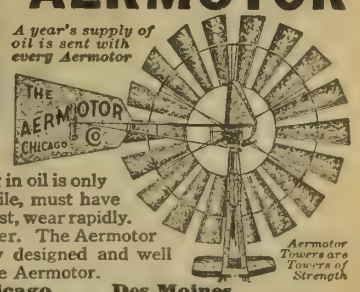
THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor



Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

When Writing Advertisers Mention California Cultivator.

paste will possibly give satisfactory results. The trouble is that this disease exists almost everywhere and may come to the orchard from the nursery trees so that there is little use in endeavoring to thoroughly disinfect the soil. In planting new trees greatest care should be exercised to have them free from small knots on the roots or any indication of knots about the crown of the trees.

Girdling to Induce Bearing

I saw an article in the Cultivator regarding girdling an orange tree in order to make it bear. Is this the right time of the year to do this?—Subscriber, Alta Loma.

Where a tree receives an injury such as girdling or partially barking the tree with the cultivator it makes "an effort to produce a crop before it dies." How much reasoning the tree may use in reaching this conclusion we are in doubt but the girdling does often cause production of a crop. We would, however, use care in girdling a valuable tree and, in fact, would prefer to girdle only a branch at a time. Our guess would be that it is now too late to have any effect on this season's crop. In fact Mr. Rideout of Whittier has reported his conclusions as to shy bearing avocado trees that spring girdling did no good whatever and girdling in the fall would result usually in increased production on the branch which was girdled. The girdling usually calls for cutting out a strip of bark one-fourth of an inch wide circling or nearly around the branch. This wound will usually granulate and new bark form over, healing before a year has passed and the tree appearing to suffer no permanent injury.

Caustic for Dehorning

Please describe method of applying caustic for dehorning young calves. Do they use common stick caustic, and what age should the calf be? Does this treatment entirely remove the horns or will they have stubs when the animal grows up? — Subscriber, Chico.

"Diseases of Cattle," issued by the department of agriculture, gives the following instructions: "A calf should be treated not later than one week after it is born, preferably when it is from three to five days old. The agent to be used may be either caustic soda or potash in the form of sticks about the thickness of an ordinary lead pencil. These caustics must be handled with care, as they dissolve the cuticle and may make the hands or fingers sore. The preparation of the calf first consists in clipping the hair from the parts, washing clean with soap and warm water, and thoroughly drying with a cloth or towel. The stick of caustic should be wrapped in a piece of paper to protect the hands and fingers, leaving one end of the stick uncovered. Moisten the uncovered end slightly and rub it on the horn buttons or little points which may be left on the calf's head—first on one, then on the other—two or three times, allowing the caustic to dry after each application. Be careful to apply the caustic to the horn button only, for if it is brought in contact with the surrounding skin it will cause pain. Too much moisture on the stick of caustic will allow the application to spread to the surrounding skin. After treatment keep the calf protected from rain, as water on the head after application of the caustic will cause it to run down over the face. If treatment is properly given at time and in manner specified above, the horns will not grow.

White Sapote

In the Cultivator of March 19 you describe a tree called the white sapote. Where can I purchase such a tree?—Subscriber, Petaluma.

Any nurseryman advertising citrus and other tropical fruit trees in the Cultivator can supply these trees.

Congestion of Cow's Udder

Referring to treatment for congestion of cow's udder, given on Page 361 of the Cultivator of March 12, a subscriber at Valley Springs writes:

"Try bathing cow's udder with any heavy molasses and rub it in thoroughly. It will go through the pores and come out in the milk. This is what I always use and always get results favorable."

Do Squash and Melons Mix?

Do cucumbers, squash, melons, etc., really "mix" when planted near each other?—Subscriber, Burbank.

No plants "mix" so far as the first generation is concerned. That is, all plants known may be grown together this year and all will remain pure so far as this year's crop is concerned. It is as impossible for those named to contaminate each other as to "mix" them with oranges or apples on nearby trees. But cross pollination may be effected within certain limits and next year's plants, from this year's seeds, may bear "mixed" fruits. But the plants of this family do not mix so readily as the general public has been led to believe and the three named will remain free. Many species of squashes refuse to cross, even when assisted by man.

Plums on Apricots

I have a lot of seedling apricots. Will the trees do well to be top-worked to plums? Upon what stocks are the following grafted — loquat, sapotas, feijoa and chestnuts?—Subscriber, Etiwanda.

Plums generally do well on apricots if soil is suited to apricots. Each of the other trees listed are budded on seedlings of their own kind.

Care of Fresh Cow

Will you kindly tell me what treatment a cow should have when she comes in fresh? I have been told not to milk her dry the first two or three times. Would like to know what to feed her to keep up production. This will be her third calf. With the second she gave about 13 quarts at a milking, but began to fall down in a few months. I fed her alfalfa hay, beet pulp, corn meal and bran, and part of the time a little coconut meal. I have received much valuable information from your paper and am glad I am.—A Subscriber, Sebastopol.

When a cow freshens most breeders leave the calf with the cow for 10 or

12 hours in order to let the youngster get several feeds of the first (or colostrum) milk so necessary to its future growth. A few hours after the calf has been removed the cow should be partially milked out, being careful not to milk her out dry. At the next regular milking hour she should be milked out dry and should thereafter be milked at regular milking periods. If your cow gave 13 quarts (or about 28 pounds per day) when fresh she should not have fallen off for at least ten months. The time to feed a cow for production and for holding to her production through the ten months lactation (milking) period is not after she has calved but before. If the cow is dried up at least two months before calving and then carried on a fitting ration composed of the following grains, with plenty of good alfalfa hay, up to two weeks before freshening, and then given a properly balanced ration she should continue to produce a good supply of milk for the ten months period, providing, of course, she is of the right type and breeding. The fitting ration is as follows: All alfalfa hay she will eat, with three hours a day pasture if available; a mixture of 100 pounds wheat bran, 100 pounds corn meal, 100 pounds ground barley, 50 pounds coconut meal (old process). Do not feed cottton seed meal at this time.—R. A. C.

Ration for Dairy Cows

What do you consider the best ration for dairy cows, taking for a basis that I have plenty of alfalfa hay but no pasture.—Subscriber, Lodi.

Alfalfa belongs to the class of feeding stuffs known as protein feeds, containing large proportions of flesh forming substances (protein) and being low in starch or he t producing substances (carbohydrates). The proportion of digestible carbohydrates and fat in feeding stuffs is known as the nutritive ratio; in the case of alfalfa hay it is around 1 to 4, meaning that there is four times as much digestible carbohydrates and fat as digestible protein in this feed. Feeding tests have shown that dairy cows in milk should be fed a ration containing one part of protein to five or six parts of carbohydrates and fats. It will therefore be seen that alfalfa hay must be balanced up with some feed high in carbohydrates and fats to bring the nutritive ratio up to the standard. In California we have two feedstuffs that are comparatively cheap and plentiful that when fed with alfalfa hay will furnish the required carbohydrates and fats. These are ground barley and dry beet pulp. Or if available a good quality of corn silage will do as a substitute for these or can be fed with either or both. We would suggest that you feed the following: All the alfalfa hay the cow will eat and one pound of the following mixture for each 3½ pounds of milk the cow is giving: 100 pounds ground barley, 50 pounds dried beet pulp. Keep salt before cow. The beet pulp may be fed moistened with two to three times its weight of water. If this method is followed six pounds a day is about the right amount to feed, feeding the barley on the basis of 1 pound to 3½ pounds of milk produced.—R. A. C.

Johnson Grass

Can you tell me an easier way to get rid of Johnson grass than by digging it out by hand. I just bought land at Bellflower and find a patch about five rods square covered with the grass.—Subscriber, Pasadena.

In a small section like this we would plow and hand work the soil if possible. Where large field is to be handled, however, it should be mowed as soon as seed stalks begin to form. Continual mowing without ever allowing the seed to ripen will reduce the pest and ultimately kill it entirely for the mowing weakens the root growth. However, later in the season much good may be accomplished by plowing and exposing the roots to direct sun heat. A chisel toothed cultivator aids materially in dragging out these roots and ending the life of the pest. As to chemical control we know of nothing which has proven successful and economical. A department of agriculture publication of some years ago gives the following summary to an extended bulletin issued by the bureau of plant industry as Bulletin No. 11:

"Johnson grass is a tall, vigorous grass, closely related to the sorghums, with a very strong system of long, jointed, underground stems, popularly known as roots. Each joint of this underground stem is capable of producing a new plant. It is a native of the tropics of the Old World, and was first introduced into this country as a hay grass in South Carolina about sixty years ago. It is commonly spread by means of its seeds. They are widely scattered from hay cut after the seed has matured, and are often planted with seed oats. The seeds are unharmed by passing through the digestive tract of animals, and are thus widely scattered in manure. The grass should never be allowed to ripen its seeds. It can be destroyed by hand labor—digging out the underground stems. Under field conditions it is best killed by plowing fallow land during hot, dry weather. The stems are thus exposed to the heat of the sun and soon killed. The same result follows the action of severe frosts."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Nursery in Orchard

For intercrop between young trees, I leased land for a nursery. Lessee agreed to trim the trees and keep down the weeds. He failed to do this. A pruner, who has evidence to the effect that the nurseryman asked him to come and I would direct him to prune the trees, came to me and asked if I wished the nursery stock pruned. I told him that I knew that the owner did. He proceeded to prune the nursery stock. The owner now claims that he did not employ the pruner, that the pruner topped too low, and not only refused to take out the stock, claiming that it will be necessary for another year's growth to overcome the bad pruning, but refuses to pay the pruner and claims damages against me. What steps must be taken to have the nursery stock taken out and make the owner pay for the pruning The term of the lease has expired.—Subscriber, Redlands.

The lease is not before the writer, but it would seem that if it was properly drawn and contains a provision requiring the lessee to keep his trees pruned, which he has failed to do, that the lessor would be entitled to employ any person to do such pruning and charge the amount thereof to the owner of the nursery, especially in a case such as this where the nursery stock is intercropped between young oranges. Whether or not the pruner was actually employed by the nursery owner is a question of fact. If he was employed, then the nurseryman is directly liable to him, but even if lessor employed him, it would seem that the nursery man would be liable to the lessor. The same rule would apply as to any possible damage to

WHY DID YOU LEAVE THE FARM

Why did you leave the farm, my lad?
Why did you bolt and leave your dad?
Why did you beat it off to town
And turn your poor old father down?
Thinkers of platform, pulpit and press
Are wallowing in deep distress.
They seek to know the hidden cause
Why farmer boys desert their pas.

Well, stranger, since you've been so frank,
I'll roll aside the hazy bank;
I left my dad, his farm, his plow,
Because my calf became his cow.
I left my dad, 'twas wrong, of course,
Because my colt became his horse.
I left my dad to sow and reap
Because my lamb became his sheep.
I dropped the hoe and stuck the fork
Because my pig became his pork.
The garden truck that I made grow
Was his to sell, but mine to hoe.
It's not the smoke in the atmosphere,
Nor the taste for life that brought me here.
Please tell the platform, pulpit, press
No fear of toil nor love of dress
Is driving off the farmer lads,
It's just the methods of their dads.

As a source of iron, potatoes, properly cooked, furnish nearly as much as do eggs and compare as favorably with cereals in the supply of lime and phosphorus.

CAN GIRLS RAISE STOCK?

By L. R. Drury

THELMA PETERSON, a 13 year old girl of Sonoma County, has proven that she can raise a bull calf that will not only win a prize for her, but earns for her a neat profit for a few months' work.

Thelma's formula for success is "Use common sense and don't be afraid of work."

The purchase price of the young calf was given her last June for a graduation present, but Thelma is a thorough little business woman, so when her calf was sold the latter part of January she paid for the feed she had used to develop it.

Following is her own essay, which earned 15 per cent of the award:

"Sometime during the summer last year I read in the Petaluma Argus an article which interested me greatly; it was about a calf club for boys and girls in Petaluma. I was so sure that I could do something along this line that I asked my father if I might join the club. He gave his consent. I had been promised a graduation present a few weeks before I had finished my school work, and now I thought I would invest my graduation gift in a Holstein bull calf.

Thelma Petersen and Her Prize Calf

"These calves were distributed to members of the club on July 17. I was fortunate enough to draw first pick. My choice was Valdessa Fayne Pontiac, a beautiful Holstein calf which came from the Burr Farm. I purchased it for $300.

"I decided, after paying such a high price, to put the calf back on to a whole milk diet, thinking this the safest way. I picked out a nurse cow, a healthy Holstein. This was the only cow from which he got any milk. I kept my calf on this diet until I felt sure of his progress and gradually decreased the whole milk and increased the proportion of skimmed milk. Since there are no rules as to the amount of grain that can be fed, I was very careful in starting the grain ration, not giving him any more than he could clean up readily, for it is better to underfeed animals than to overfeed. I found that feeding two parts of oats and one part of barley gave good results. This grain was fed immediately after he had his milk; at noon he was fed oil cake meal mixed with bran and finely cut carrots. A certain amount of kale was fed to him daily, being careful not to give him too much kale, for I insisted that he should eat a quantity of grain hay. This hay was run through the feed cutter to prevent waste.

"Regularity of feeding is very important, although cutting the ration for a day is necessary. I washed him occasionally and spent a little time leading him and also brushing him. The feeding and taking care of the calf is very interesting work.

"The trip to Davis given for the Calf Club was very enjoyable and educational. Whenever a boy or girl has an opportunity to join a calf club I should advise them to do so for there are no secrets of success, only to use common sense and not be afraid of work."

The basis upon which ratings were made at the close of the contest were: Progress in developing calf, 45 per cent; records kept, 25 per cent; essay, 15 per cent; showing at the end of contest, 10 per cent; net profit, 5 per cent.

The club was conducted under direction of Professor A. J. Rathbone of Petaluma high school. The registered title of Thelma's calf is Valdessa Fayne Pontiac. His pet name at Thelma's home was "Valley." His selling price was $700.

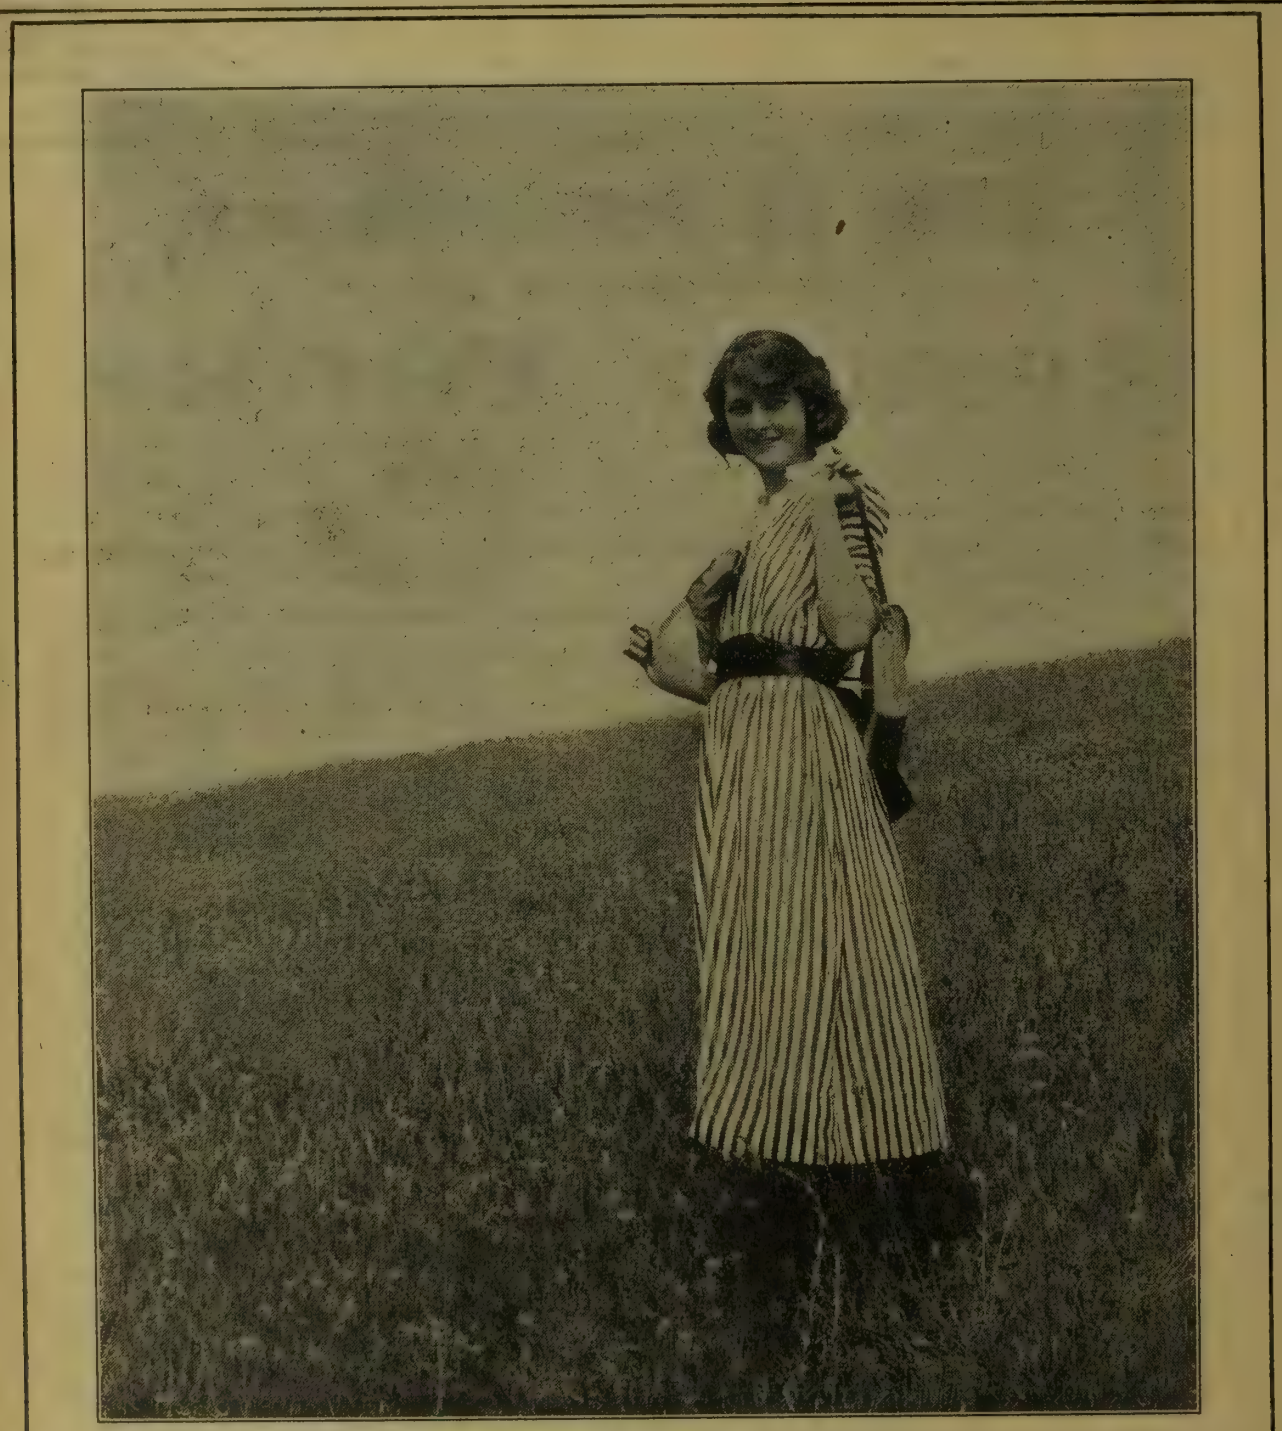
Other members of the Petaluma Boys' and Girls' Calf Club were: E. Warren Roach, L. U. Martinelli, Robert Martinelli, Sam Nisson, Thomas Putnam, Leo Schoeningh, David Sweeney, Albert Clark, Raymond Gambonini, Evelyn Foster, Florence McDowell, Charles Hinshaw, James Harris, Max Flohr, Wilmer Branchard, Everette King, Leslie Schwobeda, Andrew Ayers, all residents in or near Petaluma.

SOME OLD-TIME DYES

In your issue of March 5, 1921, a subscriber at San Fernando wanted to know how to dye rags for rugs as our grandmothers did. I am sending some directions copied from the March issue of Comfort, a monthly magazine published in Augusta, Maine, and hope they will prove beneficial. We get many helpful hints from the Cultivator.—Mrs. David T. Webb, Reward.

"Green—To produce green in the old fashioned dyes the material was first colored with indigo, dried and then put through a yellow dye which is made of quercitron, which is the inner bark from the black oak. So if one has at hand some material dyed blue with real indigo it can be colored green as follows: Place the material in a hot solution of washing soda, using one-fourth pound of soda to four quarts of water. Let it remain over night. Put the quercitron, which will be in the form of a dry paste, into a cheesecloth bag and let it soak over night in three pints of cold water in an earthen dish. To dye bring three gallons of water to a hard boil in a copper kettle and into this dye put the soaked blue material, a little at a time, only letting it remain long enough to turn green. If the yellow loses its color, pour boiling water over the bag of quercitron and drain into the dye kettle.

Deep Yellow—Copperas is the foundation for yellow and is obtainable



Kodak as you go.

There's always more fun with a Kodak along. It adds to the joy of every motor trip and keeps for your Kodak album the story of every merry outing.

Picture taking by the Kodak system is very simple now-a-days and less expensive than you think.

The Cultivator Patterns

BE SURE TO SEND SIZE

3091. A Pretty Frock.—Cut in 4 sizes: 8, 10, 12 and 14 years. Size 10 requires 4¾ yards of 27 inch material. Price 10 cents.

3247. A Charming Gown.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 4⅜ yards of 36 inch material for the dress, and 1⅞ yards for the jumper or overblouse. The width of the skirt at lower edge is 1¾ yards. Price 10 cents.

3556. Boy's Suit.—Cut in 4 sizes: 2, 4, 6 and 8 years. A 6 year size will require 2½ yards of 36 inch material. Price 10 cents.

3528. Ladies' House or Work Dress.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 7 yards of 24 inch material. The width of the skirt at its lower edge is 2½ yards. Price 10 cents.

3535. Junior's Dress.—Cut in 3 sizes: 12, 14 and 16 years. A 14 year size will require 6½ yards of 27 inch material. Price 10 cents.

3538-3543. Ladies' Costume.—Waist 3538 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3543 cut in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. To make this dress for a medium size will require 7½ yards of 36 inch material. The width of the skirt, at the foot with plaits extended is 2¼ yards. TWO separate patterns 10c FOR EACH pattern.

3554. Girl's Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. A 6 year size will require 1½ yards of 27 inch material for the guimpe, and 3 yards for the dress. Price 10 cents.

3540. Ladies' "Sleeping" Garment.—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size will require 3¾ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Therefore, we promise to deliver all patterns ordered within **TWO WEKS**; we guarantee safe delivery of all patterns Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles

at any drug store. Dissolve half a pound in a wooden receptacle with eight quarts of warm water. Stir until every particle is dissolved. In another tub dissolve one pound of washing soap or powder until thoroughly dissolved. Into the tub of copperas solution drop the material and with two smooth sticks work back and forth until thoroughly wet. Lift out of the tub (always using the sticks), drain several minutes and then drop into the tub of soapsuds. Work about until the suds have penetrated every part of the fabric, drain and then return to the copperas solution. Repeat this three times, then hang to dry without wringing. After drying, wash and rinse in clear water.

Gray—Color deep yellow with copperas as described in preceding recipe and then dip in a solution made of strong tea and water.

Manganese Brown—This is a warm medium brown. Dissolve two ounces of permanganate of potash in two gallons of warm water. The result is a brilliant crimson and the white material will take on this same color, but when hung in the air gradually change to a light brown. The cloth is not wrung, but allowed to drain on the line. As soon as it has turned brown it is redipped and again drained, when it will change to a deeper shade of brown. If a still darker shade is desired dip the third time and dry. Wash in hot soapy water and rinse well.

Bright Straw Color—This dye is made from peach tree leaves and the most satisfactory results are obtained by gathering the green leaves in the fall. Soak about one quart of leaves in warm water, to which a small piece of alum has been added, for several hours. Add the material and boil all together until the desired shade is obtained, no longer. Remove from dye, drain and dry, and rinse thoroughly.

Crimson in the old fashioned dyes was obtained from the cochineal bugs. The "single bath" contained about six per cent oxalic acid, six per cent stannous chloride and eight per cent cochineal.

Black was obtained from logwood cut into fine chips, soaked in cold water, slowly brought to the boiling point and kept at that temperature from one and a half to two hours."

HINTS FROM HOUSEKEEPERS

How to Cook Old Ham

A Los Angeles reader sends this in from Farmers' Bulletin 1186, "Pork on the Farm—Killing, Curing and Canning":

"Soak several hours, remove all mold and loose pieces, and rinse well. Cover with cold water, add two tablespoons vinegar, one-half cup brown sugar, four cloves, and one bay leaf, and heat to boiling. The amount of cloves and bay leaf may be increased if desired, especially for larger hams. Reduce heat to constant simmer and allow to cook at this temperature at the rate of 20 minutes for each pound weight. Remove from fire, but keep the ham in the liquor in which it was cooked until cold; then remove from the container and allow to drain. Take off the skin, score the fat in inch blocks, and cover with a coating of brown sugar and crumbs. Stick with cloves one inch apart. Bake in a slow oven until nicely browned, basting at intervals with one-half cup of water and one tablespoon of vinegar."

India Relish

Ten pounds green tomatoes chopped rather fine, 6 large apples (not too ripe), 2 large onions. Chop apples and onions, not too fine, in a wooden bowl. Add 1 pound seeded raisins, one and one-half pints of vinegar, two teacups of sugar, one teaspoon cloves, one of ginger, one of cinnamon, three long green peppers, two red ones. Add a tablespoon of salt to the tomatoes, let stand one hour, then squeeze out the green juice, put in a granite kettle; add the other ingredients, cook 20 to 30 minutes, put in jars and seal while hot. It is delicious.—Mrs. A. Miller, Julian.

HEADWORK

"Does Bliggens use any real headwork in his politics?"

"I don't think so," answered Miss Cayenne. "The nearest he comes to headwork is to bet a hat on the election."

DISPERSAL SALE

Toyon Farm Association Herd

135 REGISTERED HOLSTEINS 135

110 Females---25 Bulls

Los Altos, California

April, 20-21, 1921

This offering should be particularly attractive to buyers of highly bred young Holsteins, containing as it does some of the most highly esteemed blood lines of the breed.

FIVE DAUGHTERS OF SIR KORNDYKE ORMSBY PIEBE

He is a son of Sir Korndyke Hengerveld De Kol 36th, out of Queen Piebe Ormsby Mercedes, the noted 35 lb. daughter of Sir Pietertje Ormsby Mercedes, with four yearly records to her credit, the highest 1136.01 lbs. butter. These heifers are all out of sisters to the 30,000 pound 4 year old. Cascade Fleta Johanna, two of them are bred to Sir Pietertje Ormsby Canary, and one to Sir Aaggie Mead.

SEVEN DAUGHTERS OF SIR PIETERTJE ORMSBY MERCEDES 43D

This sire is almost too well known to require mention of his breeding A son of Sir Pietertje Ormsby Mercedes and out of Aaggie Wayne Peep, whose five yearly records place her among the first three cows of the breed in that respect. All except one of these heifers are under breeding age, and that one is bred to Sir Pietertje Ormsby Canary.

THREE DAUGHTERS OF SIR PIETERTJE ORMSBY CANARY

He is also by the great Sir Pietertje Ormsby Mercedes, and out of an 864 lb. 3 year old daughter of a 1000 lb. cow. A large number of females in this sale are in calf to him.

EIGHT DAUGHTERS OF SIR AAGGIE MEAD

He is by Sir Aaggie De Kol Acme, son of the world's strictly official yearly record butter cow, Aaggie Acme of Riverside 2nd, and out of Aralia De Kol Mead, 1215 lbs. butter in one year strictly official, she a daughter of King Mead of Riverside and the 1142 lb. cow Aralia De Kol who was the first cow in the world to make over 28,000 pounds milk in one year.

EIGHT DAUGHTERS OF SIR BESSIE FOBES TRITOMIA

He is by a proven son of Fobes Tritomia Mutual De Kol, and out of the famous three times 33 pound cow Jessie Fobes Bessie Homestead who made 932 lbs. butter in one year and topped the Detroit National Sale.

FOURTEEN DAUGHTERS OF NORTH STAR HAPPY BONHEUR

He is a 30 pound son of the noted bull Johanna Bonheur Champion. All of these heifers that are old enough to breed are in calf to Sir Aaggie Mead.

HIGH RECORD COWS AND DAUGHTERS OF HIGH RECORD COWS

The sale list includes cows with records up to over 1000 lbs. butter in one year, and over 30 lbs. butter in 7 days, and daughters of cows with equal records.

DAUGHTERS OF FAMOUS SIRES

Besides the sires already mentioned as having daughters in the sale the list includes daughters of King Korndyke Pontiac 20th, Chimacum Spring Farm King Pontiac, Sir Johanna Ruth Fayne, Johanna Bonheur Champion, Laconner Pontiac Segis, Dutchland Colantha Emperor, and others of high record and popular breeding.

THE OFFERING OF YOUNG BULLS

The list of 25 bulls in the sale affords a remarkable selection, including sons of 1000 pound cows, and other high record cows and heifers, most of them sired by Sir Pietertje Ormsby Canary, Sir Pietertje Ormsby Mercedes 43d, Sir Aaggie Mead, and Sir Bessie Fobes Tritomia.

THE ONLY FEDERAL TESTED HERD IN CALIFORNIA

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested by a Federal veterinarian and sold subject to retest by the buyer.

Proposed Act to Control Tuberculosis in Cattle

An act to prevent, control, and eradicate tuberculosis in cattle in the State of California; to empower the director of agriculture to establish tuberculosis eradication or free areas; providing penalties for the violation hereof.

The people of the State of California do enact as follows:

Section 1. In order to determine the prevalence of tuberculosis in cattle in the state of California, the director of agriculture shall make a survey of the state to ascertain the extent of infection in the various counties.

Sec. 2. If, after investigation, said director finds the cattle in any area, county, or counties comparatively free from tuberculosis, he may establish an area or areas to be known and designated as "tuberculosis (eradication) area." A tuberculosis eradication area shall be an area established by a proclamation by the director of agriculture. Such proclimation shall designate the territorial boundary of such area and shall be published for three successive weeks in one or more newspapers of general circulation in said area. For the purposes of this act and to eradicate tuberculosis in cattle, and to prevent tubercular cattle from being imported into such area, all cattle shall be subject to examination, inspection, quarantine and tuberculin test applied under the directions and in accordance with the rules and regulations prescribed by the said director of agriculture. After the eradication of tuberculosis in domestic livestock has been completed, the eradication area shall by proclamation by the director of agriculture, as above provided, be declared tuberculosis free area.

Sec. 3. Upon discovery by the director of agriculture of California of any bovine affected with tuberculosis, he shall cause the same to be branded with a hot iron with the letter "T" on the left neck or jaw, for purposes of future identification.

Sec. 4. All animals branded with the above mentioned brand ("T"), within or without said eradication or free areas, must not be sold, slaughtered or disposed of in any manner whatsoever, or removed from the premises where located when branded, unless permission is first obtained from the director of agriculture.

Sec. 5. Every animal known to be affected with tuberculosis may, with permission in writing from the director of agriculture, be removed from tuberculosis eradication or free area, in accordance with and under such rules and regulations as shall be promulgated in said written permission or shall be slaughtered under the supervision of an inspector of the division of animal industry of the state department of agriculture, or of the United States bureau of animal industry, and disposed of in accordance with the rules and regulations of the state of California or of the United States bureau of animal industry, governing meat inspection.

Sec. 6. No cattle shall be permitted to enter any tuberculosis eradication or free area by common carrier or otherwise unless accompanied by certificate of inspection, certifying that they have been examined and inspected within ten days before the date of their entrance into such area, and showing the said cattle to be free from tuberculosis and other communicable disease. Such certificate of inspection which shall include a tuberculin test record, shall also indicate the final destination of said cattle within said eradication or free area, and said certificate shall not be valid until duly approved, in writing, by the director of agriculture, which approval shall be written across the face of said certificate. All cattle so admitted shall remain upon the premises described in said approved certificate for 30 days or until released by order of said director.

Sec. 7. For the purpose of carrying out the provisions of this act, the director of agriculture or his duly authorized inspectors may, at any time or place, enter upon any premises, except dwelling houses. No person shall obstruct, hamper or interfere with the work of said director, his agent, or inspector, while enforcing the provisions of this act. Should any owner or person in charge of cattle subject to examination under the provisions of this act, after ten days notice in writing, refuse to properly confine in corrals or stanchions all cattle in his charge, possession or control, in order to permit of a proper examination under the provisions of this act, the director of agriculture, his agents or inspectors are authorized to employ help and incur such expense as is necessary in order to properly examine for tuberculosis any and all of said cattle, and the expense of rounding up, driving, corraling and holding for the purpose of said examination shall become and remain a lien upon said cattle, and such lien, unless paid within five days after written notice of the amount of the same has been given by the said director of agriculture to the owner or person in possession of the same, shall be foreclosed in the manner provided in section one thousand two hundred eight of the Code of Civil Procedure.

Sec. 8. Any person, firm or corporation, whether principal, agent or otherwise, violating any of the provisions of this act shall be guilty of a misdemeanor, punishable by a fine of not less than one hundred dollars or more than five hundred dollars, or not more than thirty days in jail, or by both such fine and imprisonment.

Sec. 9. In order to carry into effect the provisions of this act and other acts relating to the control of tuberculosis and animal diseases, the director of agriculture is authorized to employ a sufficient number of legally qualified graduate veterinarians and such other assistants as may be required.

Sec. 10. If any section, subsection, sentence, clause or phrase of this act is for any reason held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this act. The legislature hereby declares that it would have passed this act, and each section, subsection, sentence, clause and phrase thereof, irrespective of the fact that any one or more other sections, subsections, sentences, clauses or phrases be declared unconstitutional.

DO CATTLE OWNERS WANT THE LAW?

By R. P. Royce

I believe that tuberculosis control and eradication is largely a matter of education and for that reason hold that any attempt to successfully handle the disease in question must receive the cordial and open support of the livestock industry as a whole. Any measure as drastic as the bill now before the state legislature will not accomplish the ends all hope for because it will at once antagonize the cattle owners through conferring on state officials almost unlimited power.

I do not in any way question the sincerity of purpose back of the bill, but believe that it is entirely too drastic and impractical.

As a matter of fact the bill as it stands at present, and it has been passed by the senate, has been considerably modified from its original wording. The request for an appropriation of $27,000 to carry out the law has been eliminated. Just now it is not clear how the operation of the law is to be financed. There is nothing in the bill to indicate whether the cattle owners or the state are to stand the cost of testing.

TUBERCULIN TEST MOST RELIABLE

The diagnosis of tuberculosis in living animals by external symptoms without resorting to the use of the tuberculin test is in most instances extremely difficult. This is true even with experts who have had long and varied experiences in dealing with this insidious disease. It is true that certain external symptoms resembling those produced by tuberculosis may be recognized, but they only aid one in arriving at the unsatisfactory conclusion that the animal is probably tubercular.

When certain tissues or organs are infected the secretions or excretions or the tissues themselves may contain the tubercle bacilli which may some-

times be demonstrated by the various laboratory methods.

In the case of an udder being infected the bacilli may be found in the milk, depending, of course, upon the condition and location of the lesion. It must be remembered also that extensive infection may exist in other parts of the body and it is impossible to demonstrate the germs in the secretion of the udder.

A reaction produced in an animal by the application of the tuberculin test is regarded as unmistakable evidence that the animal is tubercular. The California department of agriculture finds this the most reliable method of detecting the presence of tuberculous infection in animals.—S. O'Toole.

THE TUBERCULIN TEST AND TUBERCULOUS CATTLE

A deal of nonsense has been written concerning the tuberculin test and tuberculous cattle. Dr. F. B. Hadley of the University of Wisconsin was one of the first men in this country with nerve enough to publish plain facts to the effect that the tuberculin test, although our mainstay in tuberculosis control work, is far from infallible. I have been telling professional and breeder friends for years that we should frankly recognize the fact that we have two classes of reactors under the tuberculin test. We may call these "Group A," the practically tuberculous, that is, present spreaders, or cattle that are reasonably possible spreaders; and "Group B," non-diseased reactors, those that are merely sensitive to tuberculin and are not now and probably never will be spreaders. Presumably cattle of the second class have at some time been infected; possibly years before. Owing to high resistance or low virulence in the virus, or perhaps to limited exposure, these animals have recovered, so far as any practical consideration is concerned, and yet remain sensitive to tuberculin, and respond to the tuberculin test. Physicians long ago frankly recognized that a large percentage of people have been infected with tuberculosis at some time and that many of them will still respond to a tuberculin test, although not in any serious sense tuberculous. Available information indicates that bovine reactors are developing lesions or have in the past developed lesions. But animals with clinically healed lesions may or may not react, and so may or may not animals with active lesions.

Granting what now seems possible, that a reaction indicates some sort of lesion somewhere, and from which there is leakage, it does not imply an active lesion or living bacilli or the probability of an animal's being a spreader. At present we are necessarily killing many Group A cattle that are not in any practical sense tuberculous. We cannot do otherwise at present and still make progress in control, but this is none the less an unfortunate situation.

To my mind the greatest need now in tuberculosis control work is a reasonably reliable method—presumably a laboratory method—of differentiating between these two groups of reactors, referred to as A and B, so there will be only one-third or perhaps one-fifth as many to condemn. We need also a more economic method of disposing of those that are condemned.

The Wisconsin state tuberculosis farm was a promising experiment and may yet lead to a less expensive disposal of the condemned. Of course, if we could differentiate we might find the number to be condemned small enough so that our present method of immediate shipment for slaughter would then be most practical. But we may never find a reliable method of differentiating between the two groups. In the meantime, therefore, let those who know bovine tuberculosis and farm and cattle management define the faults of the Wisconsin tuberculosis farm or suggest something better and thus work out the needed economical method of disposal which we now lack.

I have suggested that a method of distinguishing between group A and group B cattle and a less expensive disposal of the diseased is the greatest present need in tuberculosis control, now that we have the required public education, interest and support. To my mind the greatest danger (and it is a real one) is that our tuberculosis control work may now become top heavy in the matter of public expense. For this reason some states which I could name without much hard thinking are apt to have their whole tuberculosis control work tumble like the proverbial house of cards. We now have a wave of radical enthusiasm on the part of county agents, farm bureaus and county organizations for tuberculosis eradication, federal agents and new state veterinarians, some of whom apparently have never seen more than a surface view of tuberculosis control problems. There is something of a hurrah for immediate eradication of a disease that cannot be immediately eradicated. The history of radical and rapid methods of tuberculosis control offers suggestions that are unpleasant but wholesome.

The adoption of the intradermal test for official work, with its greatly increased speed, can easily hasten a temporary collapse, which must not be allowed to occur. The states which I have in mind may easily get more herds on the way toward accreditation than they can provide retests and reimbursements for, and then what? Legislative finance committees may balk at a multiplying ratio of increased appropriations, and then what?

Livestock sanitary authorities will do well to keep their feet on the ground during the next two or three years.—Dr. M. H. Reynolds, University of Minnesota in Breeders Gazette.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

April 6-7, Fred W. Kiesel, Sacramento.
April 14, R. F. Guerin, Tulare.

April 21 and 22—Santa Anita Rancho.
April 20-21, Toyon Farm Association, Los Altos.
April 26, Santa Anita Rancho, Santa Anita.
May 11, Victory Herd, Carruthers.

At a meeting of the board of directors of California Holstein-Friesian Association held at Sacramento on March 16, 27 new members were admitted. This is the largest number admitted covering so short a period.

Three daughters of King Segis Alcartra Abbekerk, senior herd sire for Bridgford Holstein Co., Patterson, have completed their yearly records as two year olds. Karlray Ormsby Alcartra, the great heifer sold to R. Stevens, Stockton, in the recent Guaranty Sale at Sacramento, made 22,947.1 pounds milk and 916.2 pounds butter. Modesto Korndyke Abbekerk, also a junior two year old, made 757.72 pounds butter from 16,020.7 pounds milk in 365 days. Susie Segis Alcartra Abbekerk, a senior two year old, made 781.2 pounds butter from 15,921 pounds milk. These three records average 818.3 pounds butter and 18,296.2 pounds milk, a splendid showing for the first three daughters of this bull. Several daughters of the famous Bridgford show bull, King Segis Alcartra Prilly, are now fresh with first calf and on test. Every one of them has milked up to over 75 pounds in one day, and one has over 8,000 pounds milk to her credit in the first 100 days of her yearly work, milking as a junior two year old.

While Earl Graham, Compton, is making such a showing with his herd of registered and grade Holsteins in the California Dairy Competition, he is also making some excellent official records with his registered cows and heifers. The most important perhaps was made by the junior three year old Princess Maida Veeman, with a production of 33.06 pounds butter from 666.6 pounds milk in seven days. This great heifer recently completed a yearly record of 759.1 pounds butter from 20,270.2 pounds milk, milking as a junior two year old. She is now on yearly test again and has milked as high as 115 pounds in one day, and at present is holding right around 109 pounds per day. She is a daughter

Dispersal of A Famous Guernsey Herd

55 — REGISTERED — 55
GUERNSEYS
Hollow Hill Farm
Owned by G. W. Wilder
Colton, Cal.

Thursday, April 28, 1921

In the Show Ring
In 1920, at Sacramento, Los Angeles, Riverside, and Phoenix, in strong competition, this herd won 40 firsts, 36 seconds, 11 thirds, 5 fourths, and 4 fifths, with one Grand Championship, two Junior Championships, and one reserve Junior Championship.

In Production
this herd has developed class leaders, and the sale list contains cows with over 400, 500, 600, and 700 pounds butterfat, daughters and sons of such cows.

In Breeding
this herd contains representatives of some of the most sought for imported and American families, close up to the fountainhead of the foundation animals of fashionable families.

In Health
during five years of regular testing by a Deputy State Veterinarian only one animal has reacted to the tuberculin test.

The Production Records
in this herd while large, have been made under most unfavorable conditions, as the herd has always been operated as a certified dairy and the test cows have had to undergo the regular cold water baths with the rest of the herd. Every breeder who has handled cows on test knows what effect this has on high records.

The Bulls
This is a wonderful opportunity to select a real Guernsey herd sire. The offering includes young bulls of such merit as to be attractive to owners of high class registered breeding herds, and there is also a very choice selection that will undoubtedly go at dairymen's prices.

NEXT WEEK we will give an outline of some of the great individuals in the offering.

University Farm, grade Holsteins: Ramona, 1,653 pounds milk, 54.87 pounds butterfat.

J. E. Thorp, Jerseys: Sonny's Benedita, 1,066 pounds milk, 51.16 pounds butterfat.

L. L. Wakeham, grades: Jim's Wonder, 2,?76 pounds milk, 106.97 pounds butterfat; Tony's Perfection, 1,428, 85.68.

R. H. Walrath, grades: Minnie, 1,369 pounds milk, 78.03 pounds butterfat; Pansy, 1,459, 68.57; Guernsey, 1,042, 57.31.

Winsor Ranch, grade Jerseys: Teresa, 1,089 pounds milk, 56.63 pounds butterfat.

The reports for February so far received show that 246 cows in milk during the full month produced an average of 1,107 pounds milk and 45.8 pounds butterfat during the month. (Average number of days in milk at beginning of month, 100.)

The largest production of butterfat for the month was made by the purebred Holstein cow Princess Maida Veeman, owned by Earl Graham of Compton, viz., 109.16 pounds. Another cow, a grade Jersey, produced 106.97 pounds butterfat; three cows produced between 90 and 100 pounds of fat; four between 80 and 90, and eight between 80 and 70 pounds.

The California Cultivator prize for February was won for the third time by Earl Graham of Compton, for an average production by five grades of 62.03 pounds butterfat (ranges 55.7 to 68.9 pounds; average credit 71.09 pounds). This is the third group of this prize; five grade Guernseys owned by Adohr Stock Farm of Van Nuys five grades in this herd that has won had a higher average production—69.45 pounds butterfat, but being all aged cows they received credit for this production only. Other groups of five grades eligible to compete for the California Cultivator prize produced on the average as follows: F. F. Pellissier, Whittier, 61.76 pounds; R. H. Walrath, El Centro 59.50 pounds; Napa state hospital, Imola, 56.53 pounds; Los Angeles County Farm, Hondo, 55.90 pounds; C. E. Fisher, Hughson, 45.05 pounds; J. M. Christen, Pacheco, 40.79 pounds; S. G. Gambonini, Petaluma, 38.83 pounds; University Dairy, Berkeley, 38.51 pounds.

WAR'S EFFECT ON MEAT

POPULAR misunderstanding is magnifying the superficial fact that this country has a beef surplus, a surplus that has had a precarious existence both before the World War and since. There is something more to the story than the exports of several hundred million pounds of beef and its products in a year, says a report recently released by the United States department of agriculture. To the extent that this is balanced by imports of beef, beef products and beef cattle, it is not a surplus, according to the bureau of crop estimates, United States department of agriculture.

Not only did the imported exceed the exported beef in 1914, but the equivalent beef and its products and edible offal of the cattle imported from Canada and Mexico greatly exceeded the exports of beef cattle, so that, within the scope of the terms here used, the United States was a deficiency country with respect to beef in that year to the extent of 480,000,000 pounds. Similarly in 1915, the national beef deficiency was 92,000,000 pounds.

War demands turned the tide in 1916, when the national surplus of beef was 153,000,000 pounds; in 1917 it was 206,000,000 pounds; and in 1918 the surplus was 576,000,000 pounds.

But the debits so far offset the credits in 1919 that the beef surplus fell to 59,000,000 pounds, or less than one per cent of the production, including edible offal.

The United States has been a surplus mutton country, since 1913, only in 1918 and 1919, by 1,000,000 and 5,000,000 pounds respectively.

On the other hand, the enormous export of pork and its products has been unfailing year after year for a great many years, with totals of hundreds of millions of pounds, even extending beyond two and one-half billions of pounds in 1919.

With regard to excess of either production or consumption of beef and mutton, this country may be said to be in a seesawing position, except as influenced by such high priced foreign demand as that of a great war. After all, the constant great national meat surplus is one of pork and its products.

Meat was exported by the surplus countries of the world in greatly increased quantities in response to the war's demands. The better to understand this, continues the bureau of crop estimates, it is well to compare the change in supply for the five years from 1913 to 1918 with the change for the 18 years from 1895 to 1913, or a period 3 3/5 times as long.

The total exports of all kinds of meat increased by one-half in each period; animal fats and oils gained by one-fifth in the earlier period, but remained stationary in the war period; mutton nearly doubled in the earlier period, but declined about one-half in the later one, or to the original quantity; pork gained only one-tenth in 18 years, or hardly at all, yet it almost doubled in the five years.

What was substantially the world's export meat trade of the surplus countries in 1895 was 2,734,000,000 pounds, as determined by the bureau of crop estimates; by 1899 the quantitl had risen to 3,537,000,000 pounds; and by 1913, the year before the World War began, it was 4,101,000,000 pounds. In 1918, the last year of the war, the world's export meat trade was 6,460,000,000 pounds.

Distribution of the world's exports of meat was naturally greatly changed by war. From the point of view of

A De Laval will bring prosperity to your farm

A De Laval Cream Separator saves and serves twice a day, every day in the year. It is the producer of a steady, never-failing cash income during every month, regardless of season or weather.

Its saving of butter-fat alone is so great that the De Laval pays for itself in a short time and then the extra profit is yours—to provide more comforts and conveniences, to buy new stock or equipment, or to save.

The De Laval Separator eliminates the drudgery of gravity skimming. It saves the cream wasted by an inefficient separator, and it lasts a lifetime. It is the most economical separator to buy. That's why there are more than 2,500,000 De Lavals in daily use the world over.

Sold only through agents, to insure you satisfactory service during the life of your machine.

See your De Laval agent now about getting a new De Laval. Furnished in a variety of sizes, in hand, power or electric drives.

imports, the United Kingdom, which had for many years taken 62 per cent or more of the world's total, increased its share to 75.4 per cent in 1914, and received 70 per cent in 1915 and 1916, 67 per cent in 1917, and 69 per cent in 1918. France's share of the world's meat imports increased from 1.8 to 15.9 per cent from 1913 to 1918, and Italy's from 2.1 to 10.3 per cent. The three countries named took 68 per cent, or two-thirds, of the world's total meat imports in 1913, and 95 per cent in 1918, or almost the entire quantity.

Brazil, China and British South Africa rose to some prominence during the World War as exporters of meat, Brazil especially. From a normal export of 1,700,000 pounds of meat from Brazil in 1913 and 1914, the quantity jumped to 94,000,000 pounds in 1916, to 230,000,000 pounds in 1917, and to 251,000,000 pounds in 1919, of which 146,000,000 pounds was beef, 46,000,000 pounds pork and 59,000,000 pounds unidentified meat.

China was exporting yearly about 50,000,000 to 65,000,000 pounds of beef and pork from 1912 to 1915. The quantity became 101,000,000 pounds in 1917, and rose to 148,000,000 pounds in 1919. From British South Africa meat exports, mostly beef, increased from about 500,000 pounds at the time the war began to 18,000,000 pounds by 1916, and to 46,500,000 pounds by 1919.

The war changed the United Kingdom's imports of pork and its products from 29 per cent of all meat imports in 1912 and 1913 to 34 per cent in 1916, to 40 per cent in 1917, and to 50 per cent in 1918, weighing 1,656,000,000 pounds. The fraction for beef was about 47 per cent before the war, and it fell to 39 per cent by 1918.

France increased its imports of beef relative to total imports of meat from 45 per cent in 1913 to 75 per cent in 1915, after which year the fraction declined to less than 65 per cent in 1918, or to 495,000,000 pounds.

WEIGHING MILK GIVES WORTH OF COW

Reports coming to the United States department of agriculture often include stories of the surprises which cow owners meet when they start keeping records of their cows' production. For instance, in a Missouri cow testing association there was a man who, when he entered the association, did not appear to have a very good herd; but among his cows was a crippled ten year old Jersey named Goldie. Old Goldie led the whole association, with an annual production of approximately 9300 pounds of milk and 526 pounds of fat, and an income over cost of feed amounting to $267, in spite of the fact that when the test started she had already gone three months since freshening. The amusing part of Goldie's record is that her owner tried to sell her just before she went on test, for $75. Six months later he refused $275 for her.

The whole herd of which Goldie was a part averaged over 360 pounds of fat for the year. In contrast with this was another herd of 37 cows in the same association, which had been reputed to be the best in that part of the state. Yet 14 of these were sold during the year as unprofitable, and it seemed likely that more of them would be.

Similar stories come from other states. The dairy division has been giving a great deal of effort to the extension of cow testing associations throughout the country, and there are now nearly 500 associations in various states.

The man who joins a cow testing association never runs the risk of selling a $200 milk producer for $80 because her appearance is poor, nor of wasting his feedstuffs and work on a good for nothing cow because she looks like a good milker.

It is both profitable and practicable to know for a certainty the worth of a cow by weighing her milk. A man in a cow testing association has the milk of every cow weighed and tested once a month, from which it is easy to caluculate the total for a year. He saves the trouble of doing it himself by having the cow tester do it. The tester also weighs the feed, and figures out the cost of the milk; so that at the end of a year the owner of a herd of cows knows exactly what each one has given, what she has eaten, and how much income over cost of feed she has brought him.

MOLASSES

don't measure stock food in cans!

Don't measure the feed you give your stock in quarts or pounds, buckets or cans.

Measure it in food values! Choose it for the fat elements it contains! Feed Molasses. It is rich in sugar, low in price.

A little Molasses mixed with your other feeds makes better appetites, quicker profits.

We have prepared a booklet for the stockman that tells of actual results that have been accomplished by the feeding of Molasses.

This is a regular mine of information for the man with a feeding problem. Your copy will be sent you the day we get your letter asking for it.

LIVESTOCK NEWS NOTES

(Continued from Page 463.)

of Sir Veeman Korndyke Pontiac, now heading the Burr Farm herd, Los Angeles. A large number of her half sisters by the same sire are owned by Frank M. Helm, Fresno, and another large group will appear in the R. F. Guerin dispersal sale at Visalia. Several other good records have been completed in Mr. Graham's herd, including Gamma Sarcastic of Linwood with 26.86 pounds butter from 569.1 pounds milk in seven days. Cora Jarie Pontiac, a daughter of King Pontiac Netherland Segis 3d, and one of the top heifers in the Rosamaines Rancho dispersal, made 28.29 pounds butter from 511.7 pounds milk in seven days as a senior three year old. Miss Segis Pontiac Walker, another daughter of King Pontiac Netherlands Segis 3d, made 20.51 pounds butter from 426.9 pounds milk in seven days as a junior two year old. She is out of May Walker Gelsche Korndyke, a 27 pound three year old daughter of the great 28 pound cow Locust Terrace Gold Drop.

Two daughters of King Korndyke Pontiac 20th, the $12,000 Burr Farm bull, have completed yearly records of interest. It will be remembered that these two heifers calved unusually young, both making the highest records for heifers of their age in California. Anoakia King Korndyke, freshening at 17 months of age, has made 583.8 pounds butter from 13,955.6 pounds milk in 365 days. Anoakia Pontiac Beets 2d, freshening at 19 months of age, has made 635.2 pounds butter from 15,677.7 pounds milk in 365 days. Both are owned by Anita M. Baldwin, Santa Anita.

G. W. Wilder, president of the Butterick Company, New York, has decided to disperse his high class herd of registered Guernseys on Hollow Hill Farm, Colton. The herd is unusually well bred, and the individuals in the herd have made some noteworthy official records besides consistent winnings in the show ring. The sale will be made at public auction on the farm on Thursday, April 28.

An announcement made from the box in the recent Holstein Guaranty Sale at Sacramento, by C. L. Hughes, sales manager of California Breeders Sales and Pedigree Company, has attracted wide attention. He stated that a plan has been perfected whereby any reasonable amount of money is available for the financing of notes in the public sales of registered cattle. While no details of the plan were given it is understood that the well known sound condition of the registered cattle breeding industry of California made the financing of such a move attractive to men able to supply the capital, and provides for the cattle breeding interests of the state a system of credit that is entirely original in its conception.

Charles MacDonald, who has been in charge of Toyon Farm Association herds almost since their founding, will become superintendent of Santa Anita Rancho, owned by Anita M. Baldwin, Santa Anita, immediately after the Toyon Farm dispersal on April 20-21. MacDonald has had a world of successful experience and will find plenty of scope for his talents at the big ranch.

Bert Nixon, who at one time owned one of the top Guernsey herds of the West, was instantly killed in an automobile accident at Salinas, March 23. Nixon was just on the eve of sailing for an extended trip to Australia.

Dean H. E. Van Norman of the university farm school is now in the East conferring with B. H. Rawl, chief of the dairy division of the United States department of agriculture, in regard to the World's Dairy Congress which will be held in 1922. It is rumored that Dean Van Norman may be offered the management of the congress.

Friar Rock, the $250,000 Thoroughbred stallion owned jointly by John E. Rosseter of San Francisco and J. E. Madden of Kentucky, and the cause of much litigation between the two owners, has been awarded to Madden by a New York court order. The liti-

California Wonder Corn

Something New and Good. Produces 3 to 12 good ears per Stalk. I sell the stalks with the ears right on them so you can see just what you are getting. I also sell ear corn and shelled corn postpaid. My best plots have averaged 6 ears per stalk, over 300 pushels per acre. I am now selling seed grown directly from this same stock. This seed will produce Big Crops on Your farm. A few dollars starts you making Big Money This Year. My photo illustrated booklet tells all about it and gives prices. Send for your copy today. It's Free.

USE SHIRE POWER

The cheapest and best power that any farmer can use. Shire mares will raise as good a colt when working as when idle. Breed your mares to Shire stallions, the young stock will make you a very good profit. For information on Shires write:

W. G. Lynch, Secretary, American Shire Horse Association, Box H, Tonica, Illinois.

gation arose over the question of the stallion spending part of each season in Kentucky.

Harvey M. Berglund of Dixon believes that the outlook for swine raisers was never better and states that he is receiving more inquiries for breeding stock than at any time in months. Berglund has sold boars to E. W. Comer of Sparks, Nevada, and William Shurbam of Bakersfield. Two bred gilts have been sold to C. F. Uhl of Vacaville.

F. W. Sandercock of Sacramento has purchased a Shropshire ram from the Butte City Ranch flock to head his small flock maintained near San Luis Obispo.

New herds of Hampshire swine are being established near Artois, Glenn County, by E. S. Reed and W. H. Jopes, who have recently moved to this state from the East.

Cattle in the United States are estimated by the department of agriculture to number 66,191,000 head. Of these, 23,431,000 are in dairy herds, 33,824,000 in beef herds and 8,936,000 not classified.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Ringbone

I have a horse that has a bad ringbone. It started a year ago. Can anything be done for it?—Subscriber, Vacaville.

With so little knowledge of the case it is difficult to advise what to do. If the growth is very large and the horse is very lame it is hardly worth treating. Ringbone starts with inflammation of the joint caused by an injury, as a bruise or strain, or from rheumatism. Once the inflammation is well established the joint oil and the cartilages of the joint is destroyed and a fibrous growth surrounds the joint, which is a provision of nature to hold the ends of the bones firm while bony material fills the space between them and the two bones grow solid together and become as one. If the horse is worked or allowed to exercise too much the bones do not unite and the lameness continues. At the first appearance of ringbone the horse should be placed in a box stall with a foot of planing mill shavings for a bed and the joint fired and blistered. This should be done by a veterinarian. With this treatment the bones should unite in two months and soon after the lameness should stop but still the horse will be blemished for life. After a year standing and the horse still very lame it is hardly worth treating.

Kittens Died

My cat has let two of her kittens die at 14 and 17 days old. They are white with blue eyes. They just refused to nurse and died without any apparent pain or sickness. She also came in heat again at 14 days. Could this trouble be caused by the cat eating too many gophers?—Subscriber, Earlimart.

Probably the gophers had something to do with it. White cats with blue eyes seem to be hard to raise anyway. They do not seem to have strong constitutions. The cat coming in heat so soon indicates that there was something wrong with her.

Dog Distemper

My bulldog has been sick a month and all home remedies have failed. Since we came to the ranch she has chased rabbits until she became quite thin in flesh. Now she has a cold on her lungs, has fever and nose and eyes are running. She coughs and raises some phlegm. She also has worms, the flat, white kind. What would you advise doing for her?—Subscriber, Earlimart.

The symptoms are those of distemper. After it has run for a month it is hard to cure completely. Dissolve a teaspoon of salt in half a cup of warm water and give it all at one dose in the morning. It will cause her to vomit and clear the stomach of that phlegm. Repeat this every second morning for two weeks. In the meantime give a little liver pill every few days, the same kind as people take. Feed her dry, hard bread and a little raw beef. For the worms see the article on "Tape Worms in Dog" on page 421 of the Cultivator of March 26.

Lump Jaw

Kindly advise me regarding a cow. Her right jaw is badly swollen and broken out in four different places on the ridge between the eye and nose. I have used fly blister three times and reduced nearly all the swelling. Am using fuel oil on it daily after washing it clean with hot water and sheep dip. The cow has improved very much since beginning the treatment. A veterinarian says it is due to an injury and can be cured in time, but others who are farmers say it is lumpy jaw and cannot be cured. What is your opinion?—Subscriber, Ukiah.

This may or may not be lump jaw (actinomycosis). Lump jaw generally comes on the lower jaw but there is no reason why it should not attack the bones of the upper jaw since the germ that causes it gets in through the gums at the roots of the teeth. The remedy is half a dram of iodide of potash once a day for three weeks. After a rest of two or three weeks, if it seems necessary repeat the treatment. This will probably do some good whether the germ of actinomycosis is present or not. You seem to be a good nurse and will probably have good success.

ANOTHER GREAT CALIFORNIA PRODUCER

A great record has just been completed by Norma Korndyke Cornucopia, a five year old granddaughter of Pontiac Korndyke. She has just made 38.41 pounds of butter and 666.3 pounds milk in seven days. Norma Korndyke Cornucopia is owned by H. E. Spires, Caruthers.

Lame Pig

I have a lame pig. At first it was lame in one hind leg but gradually got worse and now the whole hind part is lame. It walks on its toes and then falls over. We feed it sour milk, potato peelings and bran mash. Please tell me what is wrong.—Subscriber, Acampo.

The trouble is probably rheumatism due to damp quarters. Keep pig in a warm, dry place with a dry bed of straw and when it is possible get it out in the sunshine. Have your druggist prepare 20 powders, each containing 30 grains of salicylate of soda and bicarbonate of soda. Give one powder in the feed once a day.

KEEP A-GOIN'

Keep a-goin' and a-goin' and a-goin',
A-goin' and a-goin' and a-goin'.
'Tho you heart sinks deep within,
Just keep raisin' up you chin
And a-goin' and a-goin' and a-goin'.
—Charles Christian Gramlich.

COME EARLY!

The big Jane Garden Farm dispersal will start promptly at 9:30 each morning of the sale days, and some of the most desirable young cows in the herd are already scheduled to sell right from the opening of the sale, which is a complete dispersal of

180 REGISTERED HOLSTEIN COWS AND HEIFERS **180**

3 REGISTERED HOLSTEIN HERD BULLS 3

JANE GARDEN FARM

Owned by

Fred W. Kiesel

Sacramento, Cal.

WEDNESDAY AND THURSDAY

April 6-7, 1921

180 COWS AND HEIFERS, only eight of which are 7 years old or over.

30 COWS AND HEIFERS now on yearly test, some with 305 day records already completed.

THIS HERD is leading the Sacramento-Yolo Cow Testing Association. They are real dairy cows!

THIS HERD is one of the most highly bred groups of registered Holsteins ever offered in the West, and is the most highly bred herd ever offered in the West in equal numbers.

THIS HERD is outstanding for high average type and growthiness and splendid condition of its individuals.

40 DAUGHTERS OF SIR AAGGIE DE KOL ACME, son of the world's strictly official yearly record butter producer Aaggie Acme of Riverside 2nd, who is dam of a world's record daughter, who in turn is dam of a bull that sold for $41.000.00, King Korndyke Pontiac Acme.

30 DAUGHTERS OF KING KORNDYKE PONTIAC, the great son of King of the Pontiacs who sired the $12.000.00 bull King Korndyke Pontiac 20th, who in turn sired the $41,000.00 bull King Korndyke Pontiac Acme.

30 DAUGHTERS OF PRINCE GELSCHE WALKER KORNDYKE, one of the best sons of Prince GELSCHE WALKER, out of the same dam as King Korndyke Pontiac.

DAUGHTERS OF OTHER FAMOUS SIRES, including King Korndyke Sadie Vale, King Morco Alcartra, Segis Pontiac De Kol Burke, and Prince Gelsche Walker.

THE THREE HERD BULLS, King Korndyke Pontiac, Prince Gelsche Walker Korndyke, and Aristo Korndyke Pontiac, will sell.

A LONG LIST OF OFFICIAL RECORD COWS AND HEIFERS with up to over 34 lbs. butter in 7 days for a three year old will sell.

Every animal positively guaranteed to be a breeder; no animal tuberculin tested.

JANE GARDEN FARM is 12 miles north of Sacramento in Natomas district. Paved road on the levee all the way.

HEADQUARTERS OF SALE will be Travelers Hotel, Sacramento. Make your reservations early. Transportation to sale furnished each morning to those who come in by train.

THE OWNER is prepared to extend liberal terms to those who make arrangements with him before sale. Application for credit may now be made either in person or by letter to FRED W. KIESEL, Sacramento, Calif., care California National Bank.

Problems of the Dairymen in the Coast Region

By L. W. Wing, Jr., before Stockmen at Davis

WITH their animals upon luxuriant pasture for most of the year the dairymen of the coast region of California are particularly fortunate. With a range in temperature which is comparatively narrow as compared to any other section of our coun. try this region is well adapted to the dairy cow for she is out of doors practically the year round.

But what are the problems in our industry? Have you ever stopped to analyze your dairy operations as a business man does? The problems of our section are many. Some of them are not new by any means for they appear wherever dairying is practiced. The reading, 'riting and 'rithmetic, or the three R's, of dairying are feeding, breeding and marketing. We do not consider labor a serious problem at this time; there seems to be plenty of help available.

Silo Needed

To approach the problem of feeding in any community we must first find what is available on the farm and then study to improve what we find by supplementing with purchased feeds. As a general rule most of the dairymen of the coast region are fairly well supplied with roughage for their cows both of the dry and succulent form except in summer and early fall. For this period what do we need to supply this succulence? A silo. Dairying without a silo is like trying to run a machine with one of the main cog wheels missing. The pasture land in a great many sections has deteriorated. This should be improved so they will care for more cattle and last for a longer season. Corn for the silo and root crops make heavy yields in the coast section. These, with good pasture, supply all the succulence needed and no one should be short of succulent roughage.

A veterinarian tells me that a common trouble with dairy cattle in some sections of the coast region is impaction due to the awns or beards from alfilaria. This is an excellent forage plant during the growing season but the trouble comes in the dry season of the year when the small awns become dry and hard. He is of the opin. ion that if the cows are receiving succulent feeds there is little danger from this. Here again the silo would supply us a corrective.

Grain Feed

With plenty of alfalfa or oat hay and succulent feeds, with what production will it pay to add grain to the ration? They tell us at the present time that for a cow to be profitable she must produce 8,000 pounds of milk and 365 pounds of butterfat or over Will our dairy cows produce this amount on hay, silage, roots and pasture, without grain? If so what will be the increase when grain is added, and is it economical to add the grain? This is a problem well worth the consideration of our experiment station.

What is our cheapest grain mixture for the dairy cow at the present time? For our region it is ground barley and coconut meal, equal parts by weight. However, this does not supply as much variety as is advisable to feed and then some cows will not eat so large a proportion of coconut meal. A grain mixture that is proving very satisfactory for us in our regular herd feeding is: Coconut meal 100 pounds, ground barley 100 pounds, bran 25 pounds, cottonseed meal 10 pounds.

The nutritive ration of this mixture, according to Henry & Morrison, is 1 to 4.1 and it costs approximately $1.75 per hundred. The amount of mixture to feed per cow depends on her production and on the amount of roughage she will consume. Some will eat more hay, silage, roots and pasture grass than others, and these require less grain. The roughages are our cheapest feeds so we want to use as much of them as possible. Where cows are receiving all the hay, good pasture and possibly silage they will clean up I would recommend one pound of this mixture per cow per day for each four to five pounds of milk she produces per day if she is a Holstein or an Ayrshire; for Jerseys and Guernseys this should be for about each three pounds of milk produced per day. In feeding the individual's habits must be studied to get best results.

Breeding Pays

When one goes about over our state and sees scrub cows that utterly fail in true dairy conformation he knows that the owner is working with inefficient machines. From an inferior machine we expect unsatisfactory results, and the same is true of the scrub cow. You find many such animals still in existence in our dairy herds, although great improvement has been brought about through our cow testing associations and the pure bred sire campaign. Let's keep pushing these with renewed vigor until all scrubs have disappeared.

Care is a very important factor in high production for the dairy cow. However, until we get an animal by breeding that has inherited the ability of high production as the foundation on which to place our care we are working for naught. Lay the foundation first, get a pure bred sire at the head of your herd. Remember a bull from high producing ancestry is the cheapest in the long run as a general rule, although he does cost more. You should know what the ancestors of a pure bred bull have produced before placing him at the head of your herd.

And last but not least of our three R's comes marketing. This is of utmost importance when it comes to balancing the books. Wherever the product goes, or in what form, are we getting a fair remuneration? Close cooperation among the dairymen goes a long way toward solving our problems of marketing. There is one thing in marketing that we must bear in mind along with our cooperation and that is that dairy products of poor quality must be sold at a lower figure. There is always a strong demand for the best grade of butter on the market if there is for any and it is the inferior grades that are weakest in selling and are severely cut in price. The dairyman is the one that must stand these low prices if he produces milk or cream of a poor quality. With the climate that we have in the coast region dairy products keep very well, but at the same time vast improvement can be and must be made in our methods of handling our product. With the creameries now demanding cream that does not need to be neutralized before butter is made from it, greater care must be taken in producing and handling by the farmer. Remember that expensive equipment is not necessary to produce milk of excellent quality but right methods are essential. Of course sanitary equipment helps and makes the work easier.

In the marketing of our pure bred livestock we have an outlet that I believe will develop very fast in the near future. That is the trade in the Orient. The people there are waking up to the value of the dairy cow as an economical producer of human food. California is the logical place for them to come for their cattle for we offer them facilities that no other section can unless it be along the Pacific Coast to our north. The breeders by sending only the best and doing everything they can to make satisfied customers when they have the opportunity can help materially to develop this market. What are you doing along this line?

Are we in a rut or are we awake to our problems? Remember about the only difference between the rut and the grave is the difference in the size of the holes.

COMPLETE DISPERSAL

R. F. Guerin Herd

60 Registered Holsteins 60

55 FEMALES 5 BULLS

Visalia, California Thursday, April 14, 1921

In this entire herd there is only one animal past four years old, and the uniformity of breeding presents unusual attractiveness to buyers of foundation herds.

22 DAUGHTERS OF SIR VEEMAN KORNDYKE PONTIAC, the great 30 pound son of Sir Veeman Hengerveld now owned by Burr Farm. He has a good list of A. R. O. daughters and a large number of living daughters yet to freshen with first calves. One of his daughters made 20,270 lbs. milk and 759 lbs. butter in one year as a junior 2 year old, and recently freshened as a junior 3 year old in the herd of Earl Graham, Compton, and made 33.06 lbs. butter in 7 days from 666.6 lbs. milk.

23 DAUGHTERS OF KING SADIE VALE IDYL SEGIS, a son of King Korndyke Sadie Vale 27th out of K P Idyl Segis, a 35 lb. 3 year old daughter of King of the Pontiacs. Most of these are out of daughters of Sir Veeman Korndyke Pontiac.

Among the Individual Females Are:

TWO 21 POUND SENIOR 2 YEAR OLD daughters of Sir Veeman Korndyke Pontiac, both of which will complete excellent yearly records at Burr Farm before sale. Both bred to the $12,000.00 bull King Korndyke Pontiac 20th.

A DAUGHTER OF KING KORNDYKE SADIE VALE 27TH out of a 22 lb. 3 year old daughter of Changeling Butter Boy, second dam a 30 lb. daughter of Tidy Abbekerk Prince with 985 lbs. butter in one year.

A DAUGHTER OF A 30 POUND COW, sired by King Sadie Vale Idyl Segis.

A DAUGHTER OF A 31 POUND COW, well along with calf to King Sadie Vale Idyl Segis.

A DAUGHTER OF A 28 POUND COW. sired by King Sadie Vale Idyl Segis.

A DAUGHTER OF KING SEGIS ALCARTRA PRILLY, the Bridgford three times grand champion, out of a daughter of Spring Farm King Pontiac 5th.

TWO DAUGHTERS OF KING MORCO ALCARTRA, son of Tilly Alcartra, both heavy with calf to King Sadie Vale Idyl Segis.

A 23 POUND daughter of the twice 26 pound cow Black Patti, that is now making a big yearly record.

A DAUGHTER OF THE 30 POUND COW MELBA HENGERVELD, well along with calf to King Sadie Vale Idyl Segis.

SPECIAL FEATURE!

This offering contains one of the best bred young bulls ever sold in the west, King Korndyke Pontiac Tola. He is sired by the $12,000.00 bull King Korndyke Pontiac 20th, and is out of K P Tola, the great 36 pound daughter of King of the Pontiacs that is now finishing a yearly record at Burr Farm that seems certain to go above 1,000 pounds butter. This young bull will soon be ready for service and he is a splendid individual. If you need a real herd sire consider this youngster carefully.

KING SADIE VALE IDYL SEGIS is in the sale, and is ready for heavy service. His pedigree entitles him to a place at the head of a good herd.

SEVERAL YOUNG BULLS, some that are sure to go at dairymen's prices, complete the offering.

Mr. GUERIN'S RANCH is six miles north of Tulare, six miles southwest of Visalia

Sale Begins Promptly at 10 A.M.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and individual certificates furnished.

SUPPLY THE HOG WITH FRESH AIR

During the winter season pneumonia is a disease that is quite common among hogs. One marked cause of this disease is improper ventilation. When the hogs are housed in a tight, poorly ventilated enclosure for a time their susceptiiblity to pneumonia is intensified when they go out into the cold air.

A simple and efficient ventilating shaft may be constructed of four boards 1 by 12 inches each. The lower end of the shaft should be about one foot above the floor and the upper end extend a little above the ridge pole. A ventilator of this kind will take the impure air from the floor and the hog house will not become cold. In the majority of cases it is not necessary to have inlets for fresh air, but when such are necessary in tightly closed buildings they should be located near the eaves. For each 25 or 30 feet of the length of the house one ventilator is required.

The dairy department of the San Joaquin County farm bureau will start the season's cow testing work during April with about 600 cows signed up.

HOLSTEIN CATTLE

Messrs. Robinson & Schultz, Independence, Kansas, write:

"Three years ago in September we bought a Holstein cow for $240. This cow has produced $2,520 worth of milk in three years, and it cost us $800 to feed her. Her four heifers are worth $2,200. This cow has brought a net profit into our herd of $3,400."

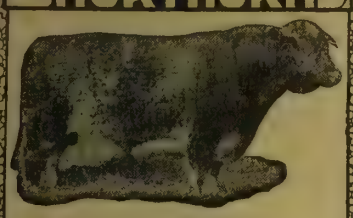
CALEDONIA SHORTHORNS



Imp. Caledonia

Caledonia Shorthorns constitute one of the choicest collections of the breed owned in America. Our herd bulls, Imp. Caledonia, Gainford Matchless, grand champion at the 1919 San Francisco show and Pine Grove King stand out prominently in the West. Our females represent choice Scotch and American families, and are noted for their type and quality. We can at all times furnish foundation material and bulls suitable for any herd or for the range. Our prices are moderate and every animal is guaranteed. Visit our farm and herd. Send for special bull list.

USE BULLS OF HIGHEST QUALITY

"I FIND that a man cannot use too good a bull, even on good grade cows. The best is none too good." This is from the letter of a South Dakota stockman forwarded by his county agent to the specialists of the United states department of agriculture, in charge of the "Better Sires—Better Stock" campaign. The stockman cites a number of instances from his own experience in raising livestock to show that the profits when a high class pure bred heads the herd far exceed those made when inferior animals are used.

"Three years ago," says this stockman, "my brother and I owned a bunch of good grade cows, just average range animals. We also had eight pure bred cows and bought a big pure bred bull of best quality. As we did not have full use for him we bred the range cows to him. We shipped some two year old steers and a few two year old heifers to market on the same train in which our neighbor shipped his steers. His animals were about the same as ours and he had a registered bull, but it was just a good average range type. Both lots of cattle were sold on the same day by the same commission firm. Our steers netted an average of $144.80, and the heifers $123.07; our neighbor's steers netted $88. Our bull cost much more than his, but we considered ours the cheaper in the end."

The writer of the letter relates an experience he had while visiting the Chicago stockyards, which again illustrates the value of good pure bred bulls. He says: "A dealer had several loads of our native cattle on the market which he had bought up from parties I know. There were good average yearlings and quite a lot of 'twos' in the lot, a fair sample of our cattle. In the next pen were two loads of Wyoming yearlings that looked as if they were all sired by the same bull and as likely a bunch as you will often see. The dealer's cattle of mixed 'ones' and 'twos' sold at seven cents and the Wyoming yearlings at 11 cents and weighed within a few pounds of the mixed loads. I do not remember the weights, but I figured the price at the time, and the Wyoming man received a premium of nearly $28 per head for using a good bull. This would be a total of $1,700, as I figured it at the time, which would pay for a couple of good bulls and leave some cash to his credit besides having the steers sisters to use in his breeding herd."

The stockman concludes his letter with some sound advice to all stock breeders and, while he has particular reference to his section of the country, his recommendations deserve careful consideration by stockmen throughout the United States. "With the cost of production high, grass rent high, labor high and scarce, and everything we use at top-notch price," he says, "we can not afford to bother raising a scrub. They will not pay, much less make a living for the owner. After what we have been through the last year, dry season and tight money, my advice to any man is, no matter what breed of cattle he fancies, when he buys a bull, buy a good one, and the best is none too good. Do not buy a pedigree unless a really good bull is attached to it. Take plenty of time in selecting a bull and when you find the one you want, buy him. I have spent the price of several bulls in railroad fare and expenses in hunting a bull that would suit me and when I found him I bought him. I have always succeeded in picking out one that has given perfect satisfaction."

SUCCESSFUL BREEDERS HAVE DEFINITE AIMS

The improvement of grades on the farms no doubt will result from the present inferior stock being bred to high class animals. If the breeder desires the most satisfactory results he must have in mind some definite aim and proceed with his plans until he has accomplished the desired results. The man who succeeds in raising livestock is usually the one who determines a logical plan of procedure and continues along that line until success has been achieved.

60 REGISTERED HOLSTEINS 60

First Individual Public Sale

Santa Anita Rancho

Owned by Anita M. Baldwin

Santa Anita, Cal.

Tuesday, April 26, 1921

A WONDERFUL OPPORTUNITY TO SECURE HIGH RECORD, HIGHLY BRED COWS AND HEIFERS BRED TO THE GREAT $41,000.00 BULL KING KORNDYKE PONTIAC ACME.

This is an offering of select cattle. Mrs. Baldwin has impressed upon every one in her own organization and in the management of this sale that these cattle go out as representatives of the Santa Anita Rancho herd, and that the utmost care must be exercised in the selection of individuals for the sale.

All of the high record cows in the herd are included in the sale list, as well as many of their daughters.

The list also includes the two great herd sires MERCI LAD KORNDYKE BURKE, and PRINCE WALKER CORNUCOPIA, as in the reduction of the herd the service can be handled alone by the $41,000.00 bull King Korndyke Pontiac Acme.

Watch next week's issue for an outline of the many great individuals in the sale. Write to sale managers for catalog now.

DUCKS

Mammoth White Pekin Duck Eggs for hatching. $1.00 per dozen. A. Surtman, Petaluma, California.

FARM LAND FOR SALE

FORECLOSURE BARGAIN
WANT QUICK ACTION

We have the exclusive sales agency on 80 acres of Eureka lemons, 5 and 6 years old. Located in one of the most favored foothill districts. Land lies level with drop of about 100 feet to mile. U. S. Soil Survey mentions this land as one of most favorable for citrus trees. Easilywo rked, retains and absorbs moisture to great depth. Allows the roots to penetrate to great depth, which makes big trees, therefore large crops. An abundance of water piped to each tree row.

There is a mortgage of $350 an acre, which can be refinanced. Can sell this grove in 10 or more acre tracts for $650 to $850 an acre, which is less than bare land price, and make terms on balance above mortgage. I say! The greatest citrus bargain in Southern California today.

DUNBAR McDONNELL,
STRONG, McGRATH & SELOVER,
1015 Marsh-Strong Bldg.
Los Angeles.
60195. Evenings 77971.

TURKEYS

Turkeys — "Goldbank Boy." Champion Giant Bronze young tom. First Prize Cockerel at the New York, Madison Square Garden Show, the premier show of America, with 4311 poultry exhibits, held January 18th to 22nd, 1921, has just been imported by us, arriving at our mountain ranch February 26th. His sire, "Goldbank VIII," was grand champion at the same show, winning first in Cock class. We have mated this young champion bird to a limited number of twenty and twenty-one pound fancy, highly colored, eastern bred hens, also just imported. No eggs of this strain for sale this season at present.
A thirty-six pound yearling son of "Copper King V," the famous thirty-eight pound yearling giant bronze grand champion of the 1919 Madison Square Garden Show, will head our other flock—having mated him to our choice twenty pound hens. Egg prices reasonable. Two young toms of this last strain on hand for immediate delivery. For further particulars address: Bronze King Mountain Farm, Box 308, Calistoga, Napa County, California.

Large Number of Choice Bronze Toms and hens, also geese and herding Collie Dogs. Shipped from St. Helena and San Miguel. John G. Mee, San Miguel.

"Goldbank" Strain — Giant Bronze turkey toms. Partridge Plymouth Rock chickens. Chicken and turkey eggs in season. M. M. Reiman, Planada, California.

Turkey Eggs—Mammoth Bronze — Write for folder. Guarantee stock built up by 5 years of untiring effort. Andrews & Andrews, "Bo-K-Haunt" Hemet, Calif.

For Sale—White Hollands, Quality, Size and Vigor. Tom $15, eggs 50c each. Blue ribbon flock header. L. A. Robinson, Hemet, California.

White Holland Turkey Eggs, 75c each, guaranteed. Pause Pheasantry, Fairoaks, California.

Bourbon Red Turkeys, Buff Ducks, Buff Orpingtons. The Ferris Ranch, Reservoir St. Pomona, California.

VALUE OF CROP ROTATION

The value of crop rotation could not be better demonstrated than in the ancient fields of the Far East. E. F. Beaumont, an American visitor, sent home photographs from Jerusalem, Palestine, taken of wheat fields on the plain of Sharon. These lands bear fine crops and have never been fertilized, yet have been farmed continuously for centuries. The peasants practice rotation with crops of the pea family.

LEGAL QUERIES

(Continued from Page 459.)

the nursery stock, with this proviso that if the lessor employed the pruner, in case of damage he, of course, would be liable. If he did not employ him, he would not be. As to failing to remove the nursery stock, it would seem that the method would be the usual one of an action for unlawful detainer after the expiration of the lease, that is, briefly, to serve the lessee with a three day notice of the expiration of the lease and require him to remove from the premises. If he fails so to remove within said three days, action may be filed to obtain a judgment to remove him, together with treble damages. In such action the lessor could also obtain payment for the expenses in pruning, if he employed the pruner.

Veteran's Exemption

The county assessor of Solano County claims that no mention is made of exemption of taxes for veterans of the last war in the constitutional amendment. Is this true?—Subscriber, Suisun.

The constitutional amendment makes no specific reference to any war, simply stating that it applies to those who have served in the army, navy and marine corps or revenue marine service of the United States in time of war and received an honorable discharge therefrom; that is to say, the constitutional amendment is not self-executing. The legislature has prescribed the procedure for its execution and also the wars which are recognized within the intent and meaning of said section of the constitution. By amendment approved May 6, 1919, the legislature expressly recognized the war with Germany and Austria as being within the intent and meaning of the section of the constitution. This amendment is found in the statutes of 1919 at page 305.

Wife Refuses to Sign Deed

In case the wife arbitrarily refuses to sign a deed to community real property, does the law make any provision whereby the husband can make such deed without the wife's acknowledgment?—Subscriber, Lucas.

When the real property stands in the name of the husband a deed of such husband would convey the title to the property, provided, however, that it be made to a purchaser acting in good faith, and without knowledge of the marriage relation. The wife may, however, bring an action to avoid such instrument within the period of one year from the date of filing the deed of record. If the title is held in both names, then they are tenants in common and it is possible that the husband can give a deed to only his undivided one-half interest, which would be unsatisfactory. There seems to be no other method than as the result of litigation.

Division of Estate

Husband and wife own community property, consisting of a ranch, title to which stands in the name of each as joint tenant with right of survivorship, personal property incident to the ranch, a joint bank account, and shares of stock standing in the husband's name. There are no children. In case either dies intestate, what becomes of the property?—Subscriber, Fresno.

In case of the death of the wife the entire community property without administration passes to the husband. In the case of the death of the husband, the ranch would pass to the wife under her title as survivor. The bank account would also pass to the wife. The household furniture could doubtless be set aside to her in the probate proceedings, but the shares of stock and personal property on the ranch would be subject to administration, in which event the wife would receive one-half and the remaining one-half would pass as separate property of the husband; that is to say, one-half to the wife and one-half to the husband's mother.

Trespassing Cattle

My land is wholly enclosed with a fence. My neighbor's cattle broke the fence and committed considerable damage upon my property. I took a few head of the cattle, sent him my bill for damages, and warned him not to take the cattle out. However, he came upon my property and took the cattle away. What can be done?—Subscriber.

The owner of the cattle, of course, had no right to trespass upon your property either to take the cattle therefrom, or at all. The law gives a lien to the taker of trespassing cattle; in fact, in an action brought to recover damage caused for trespassing cattle attachment thereon will issue without the filing of the affidavit for attachment required under the general attachment provisions. You would probably be entitled to an action against the owner of cattle for the damage caused and have an attachment issued for the seizure of the cattle trespassing.

Contract for Cutting Wood

Two Mexicans contract to cut a tree into stovewood at $10 per cord. After they have cut all but 22 feet of the trunk, they say, "It is too hard" and refuse to finish the work and demand $50 for their pay. Are they entitled to it?—Subscriber, Fresno.

If the contract was to cut up the whole tree, then the contract is entire and in order to obtain payment for their labor it is necessary for them to complete the whole contract. If, however, the contract was merely to cut the wood and they are to be paid so much per cord, then the contract is divisible and they are entitled to their pay for each cord that is cut. Whether the contract is entire or divisible is largely a question of fact.

Trees in Road

A man has a large row of almond trees in the road eight feet from his line. In cultivating these trees he works up about 15 feet of the road. This is a county road. What steps can be taken to get these trees off the road?—Subscriber, Red Bluffs.

The board of supervisors is entrusted with general supervision over the roads in the county. Each county is divided into road districts and one of the supervisors is the road commissioner within his district. In case any occupant or owner of land encroaches upon the county roadway the road commissioner of that district may orally or in writing require the encroachment to be removed. This notice must be given to the owner or person causing the encroachment or left at his place of residence, must specify the breadth of the highway, the place and extent of the encroachment, and require a removal of the same within ten days. If he fails to remove it, then the supervisor must commence in the proper court an action to abate the nuisance, in which action, in addition to having the remedy for abatement, recovery may be had of $10 for every day that the nuisance remains for ten days after service of the notice, together with costs of action. If the encroachment is not denied, but is not removed, then five days after the giving of the notice the supervisor may remove the same at the expense of the owner, recovering his costs together with $10 per day.

Collecting Note

I hold a note signed by a man and wife. They are paying for their ranch on a time contract. He has a team of horses and an old automobile. What can I do to collect?—Subscriber, Porterville.

The horses are exempt from execution. The man's labor, if he works out, is exempt from execution for 30 days next preceding the levy. Levy of attachment may be made upon the automobile and for the interest on the ranch.

AVOCADO IMPORTATIONS

Under the above title an article appeared in the Questions and Answers department of March 26 that was somewhat misleading. No avocados from Hawaii may at present enter the United States. Avocados of the Guatemalan or hard shelled type are allowed entrance to Atlantic Coast ports only under special permit from the federal horticultural board.

Install piston rings that won't leak

Save fuel and oil—prevent carbon—and increase the power of your gas engines!

Put a Supercyl Ring in the top groove of each piston to keep lubricating oil out of the combustion chamber. It stops the waste of oil and cuts down carbon troubles.

Install the real LEAK-PROOF Ring in all lower grooves. The *equal radial pressure* of its exclusive 2-piece design keeps gasoline from wasting past it. All your fuel is compressed into power—as it should be.

for Automobiles
Motor Trucks
Tractors
Motor Boats
Motorcycles
—all Farm Engines
Pumps and Compressors

These rings stand for 10 years of successful experience in the manufacture of fine piston rings. Your dealer can sell you a size and over-size of both rings for any engine ever made. Always install the combination.

Filth Kills Turkeys

C. P. EMERSON of Gardena raised 300 turkeys last year and sold them at Thanksgiving and Christmas for 50 and 55 cents a pound. This years he plans to raise 500. He does not claim to raise every turkey he hatches, but his experience extends over a number of years and he believes he has found the secret of poult mortality.

It is not overeating—Mr. Emerson is quite sure of that. The blackhead germ—trichomonas, the scientists call it now—is somewhere in the intestines of every little turkey when it is hatched, and is voided in its droppings. If these droppings are left in the coop or brooder or on the floor of the brooder house for a day or two the microbes develop, the poults pick around among the droppings more or less, however carefully they are fed, and their digestive organs are soon infected. In accordance with this theory the first aim in raising poults is perfect cleanliness.

Sawdust on Floor

All the poults are raised in a brooder house 14 feet square, and if there is more than one hatch the house is thoroughly cleaned and disinfected between hatches. The floor is covered with sawdust which is swept up and burned every day.

Brooding is done by two hovers, each 2 by 6, made of 1 by 1 planks cut into inch strips. Strips of felt are tacked underneath these frames and here 200 poults can be brooded in comfort. The hovers are attached to the roof by pulleys so that they can be hung at any height. Four hundred poults are brooded at one time, and Mr. Emerson is planning to build another house of the same capacity so that he may raise 500 or 600 poults and have them all the same age. A younger brood, he says, that has to run with turks a little older, never does so well.

An unusual feature of the brooding on this ranch is that the heat is under the floor. Two ordinary incubator lamps at opposite sides of the building are connected with galvanized iron pipes which carry the heat to a little asbestos floor under each hover. Mr. Emerson contends that turkeys are much less inclined to pile up, as well as more comfortable, if the heat is under their feet.

Feeding

Turkey eggs tested out of the incubator, hard boiled and mixed with very dry bread and young, tender alfalfa tops, are the poults' first meal and their chief ration for two months. The alfalfa tops are used as the foundation of the mixture and are run through the clover cutter with the egg and bread, now an egg, then a crust of bread and a handful of alfalfa. No onion is fed. As the alfalfa makes the mixture quite moist, a little buttermilk mash is added to dry it till it is crumbly. One turkey egg to 20 turkeys for a day's feeding is sufficient. When the mixture is ready a little chick grit is added.

This mixture is fed three times a day for the first two months and the poults are allowed all they wish. To make sure that the feed is not polluted in any way the birds are fed on newspapers laid on the floor and held down by wooden frames, a fresh paper for every meal.

While Mr. Emerson believes that the amount fed has nothing to do with the development of blackhead germs, he also believes that the condition of the bird when it eats is of great importance. If the poults come in a little chilly for their dinner they are given but half the usual ration.

Range

From the very first the poults are allowed outside if the day is warm. They are temporarily confined in a small yard made by laying 12 inch boards on edge, but as soon as they can fly over the boards they have the run of a five acre patch of melilotus. It is this big range which makes feeding such a simple matter. The poults remain in the brooder house till they are two months old when they have learned to roost and are transferred to a three acre cornfield where they roost out of doors and nibble at the young cornstalks till they are gone. Their ration now consists of bran and whole barley fed in self feeders.

When the poults are three to four months old half their bran is replaced by ground milo. Oyster shell is always before them.

POULTRYMAN'S CALENDAR—APRIL, THE GROWING MONTH

Not much hatching is done in April in this climate. The chickens are out of the shell in February and March, and April is devoted to keeping them growing.

Now is the time when a very little carelessness may spoil the whole flock. Let mites just once find their way into the coop or brooder and it may not be possible to get rid of them this season. Let the flock just once become infested with lice and some may be stunted for life. Let their fountains of water become contaminated and remain so for a few hours and serious bowel trouble may result. Coccidoisis is another enemy which is very likely to appear this month, if at all. It is generally due to contaminated ground and is best prevented by absolute cleanliness.

Don't let the growing chicks become crowded. Give more coops as they are needed. Feed a good growing mash and clean, fresh wheat and cracked corn. Green feed is important after the first two weeks. If the chicks can have green range the whole problem of exercise and greens is solved.

Makes a good Tractor engine better

You cannot expect maximum performance from your tractor engine unless it is correctly lubricated.

Zerolene is Correct Lubrication. The recommendations of our Board of Lubrication Engineers embodied in the Zerolene Correct Lubrication Chart are designed to lengthen the life of your tractor engine and keep it in condition for full service.

Ask for a Zerolene Correct Lubrication Chart. Use Zerolene for Correct Lubrication, under every working condition.

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote—"Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa.—"Not a case of white diarrhoea in three years." C. O. Petrain, Moline, Ill.—"I never had a sick chick all last season." Mrs. Wm. Christiana, Olive Ridge, N. Y.—"Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and $1.50 pkgs. Baby Chick Book FREE.

PROGRAM COMPLETE FOR POULTRY MEETING

The executive committee of the poultry department of the Los Angeles County farm bureau has completed arrangements for the big poultry meeting which will be held at Ganesha Park, Pomona, on Tuesday, April 5. The program will include the following speakers: R. W. Hodgson, farm advisor for Los Angeles County; Prof. J. E. Dougherty, head of the poultry division of the University of California, who will speak on the advantages of an egg laying contest to the poultry industry of Southern California; and J. M. Davison, president of the Poultry Producers of Southern California, who will speak on the advantages of the poultry department of the farm bureau to the poultry industry. The meeting will be in the nature of a basket picnic. All in attendance should bring lunch and cup and spoon; coffee will be furnished by the poultrymen of the Pomona district. The program will commence promptly at 10:30 and all in Southern California interesetd in the poultry industry are welcome. It is planned to make this meeting a big event for the poultry industry of Southern California, and those in attendance are assured that their time will be well spent.

Poultry Queries

Conducted by J. A. Koethen

Red Lice

Our chickens are covered with reddish lice. How can we rid them and the houses and yards of these pests? —Subscriber, Acampo.

If these lice had been more fully described I should be better able to prescribe for them. The common hen louse, which lives on the bodies o chickens, is not red, but yellow. The little red mite, which lives and breeds on dropping boards and roosts and walls, is found on the bodies of hens only at night. It never remains on the body, except on sitting hens. There is another mite, which I have never heard of in California, the "harvest bug" of the Middle West. It is bred on vegetables, grain and berry bushes, but sometimes attaches itself to the bodies of young chickens which frequent its breeding place, producing intense irritation and sometimes death. Any ordinary louse can be killed by dusting thoroughly with a strong louse powder or with flowers of sulphur. Greasing well with lard is another sure cure but should be tried only in warm weather. If these lice are in the houses I think they must be red mites, and the best way to get rid of them is by painting walls, roosts, nest boxes and dropping boards, after they have been washed with the hose, with crude carbolic acid and kerosene. Mix a quart of the acid with two gallons of kerosene and paint every inch of the wood of the house twice with a week between. The ground can be purified with lime, but it would be much better to put the birds on fresh soil for a while and grow a crop of barley in the runs.

Too Much Fiber

Two days ago I cut open two of my six weeks old pullets that had been droopy and found the end of the intestines stopped up with a thick yellow substance with a hard, red, foul smelling center. Cockerels of the same hatch in a different house are not affected. I feed buttermilk chick mash, baby chick scratch, plenty of grit, charcoal and greens. The pullets have been running on ground that is planted to barley, but the barley is not up yet. The pullets' crops are full of fiber.—Subscriber, Redlands.

You have diagnosed the case yourself. The pullets are digging up the seed barley and stuffing themselves with it. Put them in another yard and give them more whole grain. They are too old for chick scratch. Whole wheat, cracked corn, milo and Gyp corn are their proper grains as soon as you can wean them from the other. Chicks a week old will eat whole wheat if they have been educated to it. This improper ration may have developed a condition favorable to

(Continued on Page 475.)

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Price Per Pound:

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock March 29, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading

Potatoes: Supplies liberal, market firm. Stocktons: Burbanks, quality poor, 1.75@2.00; few best 2.25@2.50. Idaho: Russets, mostly 2.25@2.35. Sweet potatoes: Supplies moderate, market steady. Best mostly 2.00@2.25 lug. Arkansas and Texas, 7@7½ lb; jobbing sales, 6@6½ lb.

Onions: Supplies heavy, market weak. Stocktons: White Globes, cold storage stock, 75@1.00; Browns, mostly 35@65 per cwt. sacked.

Garlic: Local best mostly 12@15 lb.; poorer 8@10.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock March 29, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Best doz., 75@1.25; mostly 1.00@1.15.

Asparagus: Supplies liberal, market unsettled. Imperial Valley, 15@20 lb.; local 20@23; Northern quality poor, 14@18 lb.

Beets: Doz., 30@35; sk., 1.75@2.00.

Cabbage: Field cr. best mostly 75@85; poorer 50; best 1.00.

Carrots: Doz., 30@35; sk., 1.00@1.25.

Cauliflower: Supply moderate, field cr., best, 1.25@1.50; poorer, low as 75; few best high as 2.00@2.50.

Celery: Field cr., 4.00@5.00.

Cucumber: Hothouse, best, 2.00@2.50 dozen.

Lettuce: Local field cr. mostly 75@1.00; best mostly 1.25@1.40.

Peas: Supplies liberal, market firm. Imperial Valley, quality good, 10@11 per lb.; poorer, 5; jobbing sales, 7@8. Local, best 12@14 lb.; jobbing, 10@12.

Radishes: 15@20 doz.

Rhubarb: Crimson Winter, best bx., 75@90; Strawberry bx., 1.25@1.50.

Spinach: Doz., 15@20.

Squash: Summer, 1.40@1.60 cr.

Tomatoes: Mexican, per lug, best 3.50; repacked lug, 3.75. Much poor stock at wide range in prices.

Turnips: Per doz., 20@25; sk., 90@1.10.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.00@2.25; special packed brands, 2.75@3.25; Imperial box, 4.75@5.25; small sizes, 4.25@4.50.

Lemons: Market dull, wide range in prices: Local stock: Packed, box, 1.50@2.25, few high as 2.75; loose, bx., 75@1.00; lug mostly 40@50.

Oranges: Supplies heavy, market dull. Navels market pack large size 3.00@3.50; small low as 1.75; special brands small sizes 2.75@3.25 large 4.00@4.25; packing house culls, 25@50 box; few best 75. Tangerines, best, 6@7 lb., small, 4.

HONEY

Shipping Point Information, U. S. Bureau of Markets. Southern California: (First part of March). Practically no wire inquiry. Supplies heavy. Demand and movement slow, market weak. Few sales being made in 60-lb. cans. Carloads f. o. b. usual terms: White Orange and White Sage 12@13½; White Alfalfa, 8@9; Light Amber Alfalfa, 6@6¾. Hawaiian, White 7½; Light Amber 6. Due to unsettled market conditions, a large proportion of shipments are consigned to Eastern markets to be sold by packers in less than carlots. Bulk honey is moving a little more freely. Practically no export demand is reported. The heavy recent rains are said to insure a large crop this season. Many producers are still holding last year's crop for higher prices than the present market will pay. Monterey County reports most of the old crop sold, with good prospects of the coming year. San Diego County has some 35 cars still in warehouses. A very high per centage of California honey is now disposed of through cooperative associations. It is reported that contracts of the new crop are being offered for June and July shipment at very low prices. Sacked beeswax of light color is being sold in less than carlots at 33@35 per lb., dark stock being quoted as low as 26.

WALNUTS

California Walnut Growers Asociation's prices: Soft Shell, No. 1, 22½; Soft Shell, No. 2, 16½; Budded, fancy, 26½; Budded, standard, 22½.

GRAIN AND FEEDS

Grain Exch. price bid March 29:

Milo: Carlots, 1.45; No. 2 Eastern bulk, 1.53¾.

Corn: No. 2 and 3 Yellow bulk 1.55@1.61¼.

Barley: Carlots, 1.25.

Bran: Kansas, 29.25.

HAY

Alfalfa Growers of California report under date of March 28:

There were no new developments in the alfalfa market during the week. Receipts were again quite light and theoretically the price making factors just now are in favor of growers, but in reality the only benefit which they received was that the market for hay about held its own while the markets for everything else in the line of food and feed products continued in their sagging tendency.

There were 370 tons received on the Los Angeles tracks the week ending March 26, with 30 tons held over, as against 280 tons received the week before.

Rabbit Alfalfa	36.00
No. 1 Dairy	24.00
Standard	21.00

"THE BOSS" TREE PROTECTOR

We are the originators of the YUCCA PALM tree protectors and they have been on the market for 30 years. The color is light—a perfect protection against Rabbits, Grasshoppers, Heat of the Sun, Borers and Frost. It is quicker to put on than any other tree protector in the market. No strings to tie—ready for immediate use. Is open grained and allows free circulation of air. Can be readily taken off to spray the trees. Not affected by rain.

Cheap—Durable and Guaranteed to Give Satisfaction

We make all widths and sizes. Ask your Nurseryman about them or send direct to us for free sample and prices.

YUCCA MANUFACTURING CO.
1380 Willow St. Los Angeles, Cal.

Dirt or Manure

ONE MAN WITH FORDSON MOVES 12 TONS AN HOUR

LESS-MEN LOADER, special Fordson attachment, does work of 10 men, saves time, money and back-breaking labor.

Just the thing for leveling in irrigation work, for filling in, building roads, scooping sand for concrete mixers and other loading purposes.

MANURE LOADING

Manure fork and dirt scoop interchangeable. Leads a spreader in three minutes.

The LESS-MEN LOADER can be attached to Fordson or taken off in 15 minutes. Write for literature.

HIDES AND PELTS

The market on hides and skins continues weak and prices unsettled. Tanneries throughout the United States are shut down or running part time, causing light demand for raw stock.

Damaged and extra grubby hides in winter condition will scarcely bring enough to pay freight on them.

The list below will show our estimate of today's values:

No. 1 heavy hides, 60 lbs. up, 3; do, medium, 45 to 60 lbs., 3; do, light, 30 to 45 lbs., 5; do, native bulls, 2; No. 1 center branded hides, in all grades, 2 less than base price, and No. 2 center brand, 3 less. No. 1 wet salt kip, 15 to 30 lbs., 5; No. 2 wet salt kip, 15 to 30 lbs., 3; No. 1 wet salt calf, trimmed, 7½; No. 2 calf, 2 per lb. less.

Dry hides, 16 lbs. and up, No. 1, 8; dry kip, 7 to 15 lbs., No. 1, 9; dry calf, under 7 lbs., No. 1, 10. Dry stags and bulls, one-third less than dry hides. Dry glue hides, kip and calf, one-half price or less, according to quality. Pickled hides and skins, 3 less than dry flint. Dry salted hides and skins, 6 less than dry flint.

Dry Horse Hides: No. 1, large, skinned to hoof, 1.00; do, medium, 75; do, small, 50; No. 1 colt, 25@50. All cut, scarred or badly cured hides are culls, and worth proportionately less.

Wet Salted Horse Hides: No. 1, large, skinned to hoof, 2.00; No. 1, medium, skinned to hoof, 1.50; No. 1, small, skinned to hoof, 50@1.00; No. 1, colt, skinned to hoof, 25@50.

Dry Horse Hides: No. 1, large, skinned to hoof, $1.50; No. 1, medium, skinned to hoof, 1.00; No. 1, small, skinned to hoof, 50@75; No. 1, colt, skinned to hoof, 25@50. All cut, scarred or badly cured hides are culls and worth proportionately less.

Goat Skins: No. 1 large, not matted, Angora, 30 up; No. 1, medium, not matted, 15@20; No. 2, 5@10. Damaged skins and very small kids, worthless.

Pelts: Long wool, 9 to 12 months' growth, 65 up; medium wool, 6 to 9 months' growth, 50@60; short wool, 3 to 6 months' growth, 25@40; shearlings, good, 1 to 3 months' growth, 10@20; shearlings, shaved or damaged, 9@10. Lambs, large, long wool 25 up; lambs, small, 15@20;

POTATOES AND ONIONS

Wholesale prices:

Potatoes: Street prices: River, 1.90@2.15 for No. 1; do, Oregon Burbanks, 2.00@2.25; New, 8@10 lb. Idaho Gems, 2.25@2.40. Sweet potatoes, nominal; Nancy Hall, 5.00@6.00 per 100 lbs.

Onions: Australian brown, 50.

Garlic: New, 7@10 lb.

Kafir: Eastern, 1.60@1.70.

HAY AND FEED

Alfalfa Growers of California report under date of March 28:

No. 1 Dairy	19.00
Standard Dairy	17.00

Under date of March 26 A. W. Scott Co. says:

Receipts last week somewhat lighter. Throughout the country, although shipment to all the markets has been moderate, supply has been sufficient for all requirements and there has been very little activity. Hay sentiment, however, has an undercurrent of strength. The visible supply is apparently not great, nor more than will normally be consumed this season. Those farmers still holding their hay appear firm in their conviction to sell at the present market or better or else hold their crops over until next season, believing they will do as well then, or better. This feeling causes trading to be light and all reports coming in of lots sold show them to be based on the present market.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Tame Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00
Barley, ground	33.00@35.00
Barley, rolled	29.00@30.00
Bran, Red	34.00@35.00
Bran, White	36.00@38.00
Millrun	38.00@40.00
Middlings	47.00@50.00
Linseed Meal	60.00@65.00
Cocoanut Meal	26.00@27.00
Alfalfa Meal	28.00@29.00
Cottonseed Meal	40.00@46.00
Sugar Beet Pulp	40.00
Molasses, Tanks	23.00
Molasses, Barrels	26.50

Citrus Markets

Los Angeles, March 30, 1921.

Some of the finest Navels ever out of California are being shipped at the rate of 200 to 300 cars daily. Occasional sales as high as $5, but more often from 2.50 to 4.00. Navel people are fearing that Valencia men may get restive and begin shipping before Navels are cleaned up and prevent satisfactory cleanup prices. Valencias are already going forward in limited quantity.

No change in the lemon market.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 13,046 cars; lemons, 2,768; total, 15,814. To same date last season: Oranges, 12,486; lemons, 2,471; total, 14,957. From Central California to date, this season: Oranges, 4,329; lemons, 117; total, 4,446. To same date last season: Oranges, 3,536; lemons, 274; total, 3,810. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

BEEMAN
Multi-Service Tractor

Easier, Faster, Better

For plowing, cultivating, harrowing, mowing, hauling, in fact any small tillage task a BEEMAN TRACTOR fills the bill. It goes where a horse can't go--under low branches, through close quarters. It's economy to buy and operate a BEEMAN for all of your one horse jobs.

AMERICA'S PIONEER SMALL TRACTOR

Four years' successful use on farms, truck gardens, orchards, etc. has proven the superiority of the BEEMAN. This multi-service, powerful tractor also delivers 4 H. P. on the belt. Write direct to your nearest distributor for illustrated catalog and complete information terms, prices, etc.

DURANGO COTTON SEED

From one of our best test fields, resulting from three years' selection, starting with carefully bred California acclimatized seed. We rogue for less spreading type of plant, permitting close planting; for productiveness and for larger bolls which open wider, fluff more and pick easily; also and especially for early maturity and for lint length and strength. We receive premium for uniformity lint length, strength and color. Seed cotton from which these seed selected ginned over 32% More net income per acre growing this type Durango than any other kind or type of cotton known to us. Our seed purchased in carload lots by Cotton Associations. We ship to Arizona, New Mexico and East. Inspected and approved by Government officials, State Entomologists and Quarantine officers. Ask any of them. By the bag, approximately sixty pounds, five cents per pound, f. o. b. Westhaven. Check must accompany order. No more carload lots. Telegraph for ton prices. BOSTON LAND COMPANY, Westhaven, Fresno County, California.

The Life of Your Tractor

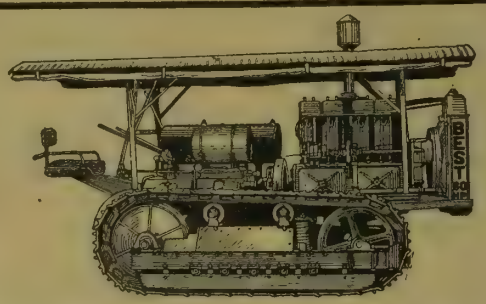
YOUR investment in machinery this year should be with an eye to the future. The new equipment you acquire should be so inherently *long-lived* that you don't need to think of replacement for years to come. Especially your tractor purchase this year should, more than ever, be along quality lines—a long-time investment.

Buy a tractor about which there it not the slightest doubt as to its long-wearing qualities. You know, Best Tractors were among the first to be built. During the many years since those old round-wheel steam days the Best has developed through the constant application of experience, into a tractor which you farmers have come to genuinely regard as a dependable, long-lived, low-running-cost machine.

There's not the slightest doubt in your mind as to Best design, materials and workmanship. All these things are expressed in the faithful service you have seen rendered by Best Tracklayer Tractors for so many years. Best is the safe tractor for you to buy this year—or any year, and this is the year in which a good tractor can help reduce the cost of crop production.

There are two models of Best Tracklayer farm tractors—the "Sixty" and the "Thirty." The "Thirty" is shown above, pulling four 12-inch bottoms 10 inches deep.

Write for our catalogs and descriptive literature and the name of our nearest dealer.



This shows in miniature the Best Tracklayer "Sixty"—the big brother to the "Thirty."

UNIVERSITY OF CALIFORNIA LIBRARY

The Richest Poor Farm in the World

THE title of this article across the page above may not be capable of proof. We have no statistics as to extent or production of poor farms of this or any other county, but several of the counties of California have institutions which are rich in material return to taxpayers and are rich in example as to upkeep and cultural practices. One of these has a challenge out as to one feature of its productiveness, and that is its dairy. This county is Los Angeles, and it challenges the country to show a grade dairy with greater average production or better return considering cost of upkeep and investment in its stock.

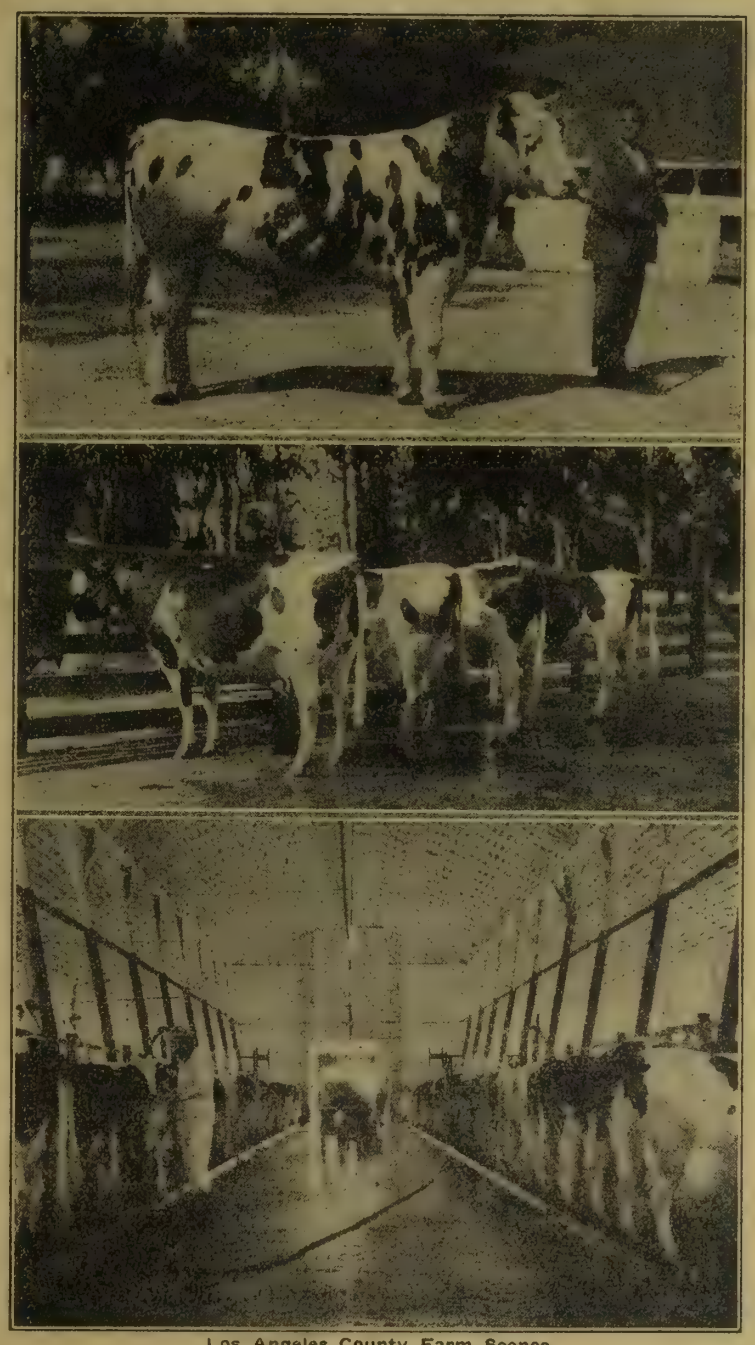
So we feel entirely justified as a Californian in coming forward with the "greatest on earth" claim and if "called" will ask some other California county to make good what we now claim for Los Angeles; the banner for the "Biggest on Earth" must be held out here by the Sunset Sea.

This dairy is proof of the wisdom of the campaign for better sires, for only a few years ago it consisted of a bunch of mongrels with a very few grades and with a production something like the average production of dairies the country over. Long before the better sires campaign started, better sires were secured for this particular herd, and an illustration on this page gives striking example of what a better sire can do or, rather, what he has done. These four full sisters are the daughters of Number 21, a cow whose highest annual production was 319 pounds, and are sired by King Jones Homestead, a registered Holstein bull. The production of the heifers so far made is shown to be materially above this in the figures given underneath the photograph. While the sire is not noted as a great animal of the Holstein breed, he was capable of endowing his daughters with high production.

But we are dwelling too much upon the livestock end of this great farm. The remainder of the livestock story will be left to Mr. Klein, whose notes follow.

The farm was purchased many years ago to provide a place for the county's indigent. Like many other municipal or state properties, greatest care was not exercised in selecting the site. About 800 acres were purchased, and some of it the richest and finest soil in the world, while other acres are heavily impreg-

(Continued on Page 487.)



Los Angeles County Farm Scenes

Photo at the top shows Superintendent Harriman with the newest addition to the dairy, King Korndyke Pontiac Mead, purchased of the Morrisses. He is the son of King Korndyke Pontiac 20th, purchased by the Burr Farm for $1,200, and De Kol of Valley Mead 2nd.

The middle photo shows four full sisters. The oldest, the second from the left, with her first calf milked only eight months when she freshened again and in that time produced 220 pounds of fat. In her second year on test she produced 462 pounds and in her third year 639 pounds. The next younger, third from the left, during her first year's test produced 446.9. She is now on her scond test, having in that time produced 355.8. The other two are twins. The first with her first calf has now been milking five months and has produced 283.4 pounds fat. The other has been on test only two months and in that time has produced 33.2.

The lower photo, taken on an ordinary milking day without being dressed up for company, shows the thorough cleanliness which obtains everywhere on the farm.

Cletrac
TANK-TYPE TRACTOR

Hard this way but—

Easy on a track The Cletrac Way

Specifications

Horsepower: 12 at drawbar, 20 at belt pulley.
Length: 96 inches.
Width: 50 inches.
Height: 52 inches.
Weight: 3455 pounds.
Turning Circle: 12 feet.
Traction Surface: About 800 square inches.
Center to Center of Tracks: 38 inches.
Belt Pulley: Dia. 8 inches; face, 6 inches.

This Year You Want Results

Half-way methods won't "get by" this year. You need results and profit—*more* work at *cheaper* costs.

And here's the very reason that now more than ever before you need Cletrac on your farm.

Cletrac has proved itself on every Pacific Coast farming job.

Every orchard man knows its marked success in orchard work. Low-set, smooth-bodied, short-turning—Cletrac works close to the trees, leaving no patches for horses to finish up.

On any draw-bar work—plowing, discing, drilling, harvesting, hauling—no matter what the job and no matter what the soil—even soft sand, tule, volcanic ash or gravel—in good condition or bad, Cletrac works when you need it and finishes on time. This tank-type tractor lays its own endless track and gets a firm grip on any ground.

When it comes to tough jobs—plowing "nigger wool" or up-grade work in the foothills—Cletrac has the power and low center of gravity to perform in many cases where even horses would find it hard to satisfy.

Add to this Cletrac's all-the-year, all-purpose ability on draw-bar and belt work and you'll know why every Cletrac owner will tell you that Cletrac has more than made good for him and will for you.

You will find real value in our booklet—"Selecting Your Tractor." Write for it today and see your local dealer.

Culture of Sorghum

By Geo. W. Hendry

THE sorghums are a comparatively recent acquisition to the field crops of the United States. In 1903 there was about 2,000,000 acres planted to these crops, but by 1920 this had increased to about 6,000,000. The increasing utilization of these crops has been due to the recognition of their value in the semi-arid portions of the country where they have few equals as summer grain and forage producers. The rise of the sorghums to popularity in California has been even more rapid than in other parts of the United States. In 1899 they occupied approximately 20,000 acres. Ten years later, in 1909, they occupied 44,000 acres, and last season (1920) a total of 150,000 acres was planted to this crop. This is considerably in excess of the acreage devoted to Indian corn and is approximately equal to the acreage of rice or sugar beets in the same year. The countries which have led in sorghum production are Tulare, Imperial, Stanislaus, Kings, San Joaquin, Kern and Colusa. A considerable portion of the sorghum acreage consisted of double cropped land, sorghum following grain or grain hay as an irrigated crop. Another considerable portion of the sorghum acreage consisted of intercropped young orchards.

Soil and Climatic Requirements

Sorghums of various kinds are similar in their soil requirements and succeed best on productive soils of medium texture. They have been satisfactorily grown, however, both on sandy and adobe soils. Sandy soils are satisfactory but are more dependent upon irrigation than the other types. Adobe soils have produced very satisfactory yields of both grain and forage, but are more difficult to manage and require more careful attention in their preparation.

As regards climate the sorghums prefer the warm, dry interior districts and do not thrive in the cool coast sections or at mountain elevations. The sweet or forage sorghums, however, are better adapted to coast and mountain climates than the grain sorghums, and are more nearly like Indian corn in this respect. None of the sorghum varieties are injured by extremely high temperatures as beans frequently are, and grow to perfection in the interior districts of Southern California and in the Imperial Valley. They have the ability to yield satisfactorily with a lower percentage of moisture in the soil than many other crops and will also recover after having been stunted by a severe drouth, under circumstances which would have resulted in the failure of Indian corn. Experiments by Churchill in Oklahoma have shown that the sorghums have been the last crops to die, in experiments in which several crops, including cowpeas, corn, soy beans, small grains, etc., have been killed by a withdrawal of moisture. The drouth resisting equipment of the sorghums consists of a very extensive root system, which is capable of utilizing soil moisture to a low limit, and a leaf system which gives off moisture more slowly than many other crops, enabling the crop to make the most complete utilization of the moisture taken from the soil.

Fitting Land for Sorghum

Like other summer crops, the land may be best prepared by deep fall or winter plowing, followed by shallow spring working to prepare a seed bed. If the land is spring plowed, a shallow plowing is generally more effective in the final preparation of the carefully prepared seed bed which is required for this crop. Yields of 3,000 pounds of milo have been secured at the university farm without irrigation, but in order to do this it has been necessary to plow the land deeply early in the fall, allowing it to lie rough as plowed throughout the rainy season and to cultivate the surface after each rain from the middle of February until planting time in April. Sorghum seeds of all varieties are small, and young seedling plants are delicate and make a slow seedling growth, consequently a well prepared seed bed containing moisture within three inches of the surface is essential, and the crop cannot be grown on weedy land without considerable hand hoeing to prevent the weeds from choking out the young seedlings in their early stages of development. The most frequent cause of failure with these crops has been a failure to secure a stand, and too often the seed has been placed in a dry, cloddy seed bed which has not contained sufficient moisture to insure germination. The importance of frequent spring working preparatory to planting cannot be too strongly emphasized and the soil should be disked, cultivated, harrowed and rolled as often as is necessary to maintain moisture near the surface until the ground has become warm enough to insure the germination of the seed.

Because of their late maturity it is not generally advisable to attempt to grow the saccharine or forage varieties of sorghum following grain, but milo, because of its rapid growth, may be planted on irrigated land as late as June 15 and yet mature early enough in the fall to be harvested before the rainy season sets in. In preparing land for milo following grain it is necessary to first burn the stubble prior to making the seed bed. The land should then be irrigated either in furrows or checks and plowed to a moderate depth. A second irrigation should then be given and the seed bed finally prepared by disking and harrowing. The second irrigation is desirable to consolidate the freshly plowed land and to obliterate the air spaces in the bottom of the furrows which are so objectionable to summer growing crops during the hot weather of July and August.

Undesirable and Desirable Milo Heads

The specimen at left is objectionable in having a "gooseneck" or recurved stalk and in its loose texture. The head at right is considered preferable because of its erect head and compact texture. It is smaller, but because of its greater density is equal in weight to the larger head. The erect type of head lends itself more readily to machine harvesting.

Planting

The highest yields of both grain and forage have been obtained at the university farm by planting as early in the spring as possible. All of the sorghums require a warm, moist soil in which to sprout, and the seed will rot if planted before the soil has become thoroughly warm. There is considerable difference in the ability of the different varieties to sprout under favorable temperatures, but as a class they are more sensitive in this respect than Indian corn. In the Sacramento Valley the earliest safe date for planting usually occurs about April 15, but in the San Joaquin Valley and in Southern California it is frequently possible to plant as early as April 1. The young seedlings are sensitive to frosts and will succumb if planting is done too early.

Under average conditions the seed should be dropped from three to four inches apart in rows three to four feet apart and the plants later thinned in the rows so that they stand from eight to ten inches apart. It is generally necessary to drop the seed more closely than it is desired to have the plants ultimately stand, in order that a full stand may be insured, and to later remove the superfluous plants by hand thinning as in sugar beets. For the spacing suggested above, from three to six pounds of seed will be required to plant one acre on a perfectly prepared seed bed, but by using an accurately calibrated planter, one pound of seed would be sufficient. A two row corn planter of the ordinary type equipped with sorghum plates is the most satisfactory type of implement. Planters equipped with listers of either the disk or shovel type designed to open a shallow furrow just in front of the runner are very useful in planting seed on ground which has lost its surface moisture. By the use of planters of this type it is possible to place the seed in moist soil even though the surface soil has dried to a depth of four or five inches and yet not cover the seed more than one-half inch. Many implement dealers carry double disk listers which may be attached to ordinary corn planters. The most important thing in planting sorghum seed is to place the seed in direct contact with moist soil and to firm the soil directly over the seed immediately after planting.

In planting saccharine sorghums for forage purposes the seed may be drilled with a common drill using from 30 to 50 pounds of seed per acre. The crop may then be harvested as a hay crop or simply pastured. The sorghums are never planted in checks like corn and produce better yields when grown in cultivated rows.

Cultivation

The seedling plants of all sorghum varieties are small and make a slow early growth, consequently they are more apt to be injured by weedy ground than the more rapid growing Indian corn. If weeds become plentiful while the seedlings are just coming above the ground it is generally a good practice to harrow across the rows, using a light spike tooth harrow set with the teeth slanting backward at an angle in order to destroy young weeds. Harrowing of this kind will result in little or no injury to the sorghum stand. As soon as the rows

Agricultural News Notes of the Pacific Coast

Northern California

The Sonoma County farm bureau has voted approval of the anti-alien land law.

A few sales of hops at 15 and 16 cents are reported by Sacramento Valley growers.

May 7 has been chosen as date of the second annual picnic of the Sutter County farm bureau.

Farmers of Placer County have been conferring with the object of establishing a uniform wage scale.

The recent Holstein Guaranty Sale at Sacramento made an average of $844. The topper sold for $2,000.

An ordinance designed to guard against the importing of foul brood into Butte County has been passed

Members of the Placer County farm bureau recently inspected cold storage plant operated by the Chico farm bureau.

Northern California wool growers have organized a warehouse corporation. The president is Fred Ellenwood.

The cloudy weather of this season has made for serious increase of pear scab. Lime-sulphur has been used to treat it.

Glenn County hog breeders report greater interest in hog raising and a material increase in the hog census of that county.

Work has begun on houses of the poultry demonstration plant at Hayward. The work will be conducted by the university extension service.

Folsom state prison will hereafter maintain a pure bred Holstein dairy herd instead of grades or scrubs which have made up the herd in the past.

Glenn County farm bureau dates: Codora, April 11; Orland, 13; Plaza, 15; directors meeting at Willows, 16; Capay, 20; Larkin, 22; Grapevine, 27.

Ninety per cent of the raisin grape growers of Yolo County are reported to have signed contracts for marketing their grapes through the Associated.

Tehama County farm bureau dates: Dairyville, April 13; Antelope, 14; Bend, 15; Corning, 21; Los Molinos, 25; Liberal, 28; Bowman, 30; directors meeting, Red Bluff, 10:30 a. m., April 23.

Demonstration of construction of a household evaporator was given at the home of Mrs. T. E. Rice, Livermore, on March 29, under supervision of Miss Clark of the university extension service.

Partial returns on the annual census of the lumber production for California show a cut by 27 of the largest mills in the state of 630,225,000 board feet. The same mills cut in 1918 582,622,000 board feet.

The quarterly milk score contest held in Hayward, March 21-23, shows average score obtained in March 7.5 per cent higher than in December. The milk scored includes the principal supplies for the towns of San Leandro, Hayward, Niles, Irvington and Centerville.

Ranchers of Colusa County have organized "to fight for their homes." Francis Heiny has been retained to guide a defense association against the encroachments of certain drainage districts which the ranchers feel are jeopardizing their rights and, in fact, their title to their home lands.

Central California

Spinach packing has begun at Armona, Kings County.

Stanislaus County Farmers Union held banquet at Turlock, March 30.

San Joaquin County has planted something over 50,000 fig trees this season.

A new apple packing law has been introduced into the legislature by Assemblyman Cleveland.

The Earlimart farm center of Fresno County will enter a float in the Raisin Day parade at Fresno.

Some San Joaquin County grape planters have found profit in 18 inch sub-soiling before planting of vines.

Tulare County farm bureau's marketing department has made sales of fat calves to the advantage of the growers.

The Eastern Sierra Livestock Association was organized at Bishop, Inyo County, March 19, with W. R. Ford as president.

J. A. Rollins of Tulare has been appointed manager of the third annual Tulare County Livestock and Agricultural Show to open September 12.

A dairymen's banquet was held April 6 at Hanford on the occasion of presenting prizes to winners in the cow testing contest which ended March 31.

The Tulare County Cattlemen's Association called a mass meeting at Porterville last Saturday to protest assessments on grazing land in the hills.

The incipient strike in the Modesto plant of the Milk Producers of Central California has been smoothed over and the directors report "business as usual."

Horticultural Commissioner Dixon of Inyo County reports 42,407 trees and vines shipped into Owens Valley this planting season. Pears lead, with grapes a close second.

The dairymen in the Merced section have decided to organize and build a creamery to handle the output of that section. The creamery will be built at either Atwater or Merced.

A number of Merced people attended the conference of the State Automobile Association in San Francisco recently on the subject of improvement of roads in the Yosemite Valley.

The campaign to encourage bulk handling of grain is continuing though its endorsement by the farm bureau is not at all acceptable to some whose interests call for continuation of the old sack method.

Two hundred dairymen of the San Joaquin Valley Milk Producers Association attended the annual meeting at Fresno, March 31. The election of officers was postponed on account of the lack of a quorum.

The schools of Barstow, Biola, Vinland, Dakota, Sunset, Hawkeye, Empire, Dunkard, Kerman, Kerman intermediate and Kerman high will take part in a May festival to be held at the Kerman Union High School, May 6.

Central California barley growers are now complaining over marketing conditions and calling attention to the fact that Mediterranean grown barley is now being shipped to this country at prices which would compel California growers to sell at $1.10 in order to compete.

Southern California

Lima beans took an advance of one cent last week.

Palo Verde's 1921 cotton crop totaled 16,000 bales.

Banning apricot orchardists are busy thinning a heavy crop.

Orange County dairymen are conducting a silo building campaign.

Onion growers of Coachella Valley have adopted the federal grading rules.

The pods of the carob or St. John's bread are declared to be excellent for home brew.

New Yorkers of Southern California will picnic today at Sycamore Park, Los Angeles.

The 1920 walnut crop held by the California Walnut Growers Association has been cleaned up.

The Arlington farm bureau is conducting a drive for membership in the newly organized poultry department.

Westmoreland, Imperial Valley, estimates its lettuce shipments at 125 carloads. The season is practically ended.

The Carlsbad Vegetable Growers Association, San Diego County, has been incorporated with 54 growers members.

The Lankershim Laconic reports prospects for short apricot crop in the San Fernando Valley of Los Angeles County.

Twenty tons of beans have just been sent to starving peoples of the Near East through the Santa Paula chamber of commerce.

A new monthly shipping service to the Orient has been established. The first steamer in this service leaves Los Angeles April 17.

Horticultural Commissioner Waite of Imperial Valley says that peas are proving one of the most profitable crops in that section.

The Beekeepers Association of Orange County has voted to affiliate with, or rather to become a department of, the county farm bureau.

Nineteen courses in vocational agricultural training will be given by the state university in its summer session at Chaffey Junior College at Ontario, June 20-July 30.

The Mohave Valley Fruit Growers Association, recently organized at Victorville, has adopted by-laws and is ready for campaign to protect fruit growers interests.

Leroy Smith of Garden Grove, Orange County, is winner of first prize in the pig club contest. He will be given a trip to the university farm school at Davis this fall.

The Ontario shipment of oranges in baskets has arrived in the market and is reported as selling very satisfactorily. In the carload were 504 baskets each containing 50 pounds of fruit.

Horticultural Commissioner Brosius of Riverside reports planting of deciduous fruits and grapes this season far ahead of 1920's record. Pears are the leader, plums and prunes, second.

Imperial Valley's shipment of cantaloupes last year totaled 8,907 cars, and from the planting and present condition of the fields it is thought the coming season's output will be even greater and of higher quality. Last year's first single crate shipment was made on May 9 and the first carlot shipment on May 23.

The Coast and General

The 15th annual yearbook of the International Farm Congress is being issued.

Winter rye crops are extensively planted in Washington for spring hog pasture.

A 64,000 bushel sale of wheat was made last week at Walla Walla, Washington, for $1.40.

Sheep men of Arizona predict that this year's lamb crop will be considerably below normal.

Ice harvesters of the Northwest will hold their annual convention this year at Yakima, Washington.

Building contractors in Phoenix estimate that building costs are 20 per cent less than the costs one year ago.

Railroads are still claiming that operating costs prevent lowering of freight rates on any agricultural products.

Spinach growers of Oregon are planting larger acreage and will dehydrate practically all the product of that state.

The Arizona Reclamation Association at a recent session elected E. W. Michael of Phoenix president, and C. O. Case, Phoenix, secretary.

Warm weather in some eastern fruit sections has caused much unseasonable blossoming of fruit trees and late frosts did some damage.

Representatives of the principal grain growing states met in Chicago, April 6 to consider American farm bureau recommendations in the matter of grain marketing.

Farmers and stockmen in Yavapai County, Arizona, through the cooperation of representatives of the U. S. biological survey are making a systematic warfare on prairie dogs.

The third International Mining Convention was held at Portland, Oregon, April 5-9. Fifteen hundred delegates attended from Northwestern states, British Columbia and Alaska.

W. B. Cloyd, president of the Yuma Valley Produce Growers Association, and one of the pioneers in growing Hairy Peruvian alfalfa, states that it is a mistaken idea that alfalfa cannot be safely planted in March and April. He backs his statement up by the experience of Yuma Valley farmers, and the campaign for alfalfa will doubtless encourage a heavier planting of late alfalfa.

A new plan for teaching vocational agriculture is being tried out in schools at Chandler, Arizona. Under this plan teachers of agriculture in the vocational schools have grouped boys over 14, not according to school grades, but according to age and the interest of the individual in agriculture. The plan works so well that it will probably be tried by other agricultural vocational teachers in different towns of the state.

Senator Hugh Campbell, president of the Arizona Wool Growers Association, stated recently that the losses of Arizona sheepmen last year would total $1,000,000. One of the reasons for heavy losses is lack of feed along the runways or trails between the northern summer ranges and the lower valley winter feeding grounds. Lower rates are being asked for, along the Santa Fe railroad in order that the sheep may be shipped instead of driven.

The Best is None Too Good for Us

By A. Layman

INVESTIGATIONS by the department of agriculture during the past few years have established the fact that surroundings of homes in cities are as a rule far more healthful than in rural sections. This has been quite a distinct shock to those of us who are believers in the ideal conditions which should be demanded by every rural home. City sanitation is an absolute necessity and sanitary surroundings must be maintained for every home whether the owner so wills or not. About the rural home the will of its owner is supreme and he is so often engrossed with the production of sufficient crops to feed his family that too often he forgets and cares not for his own in matters of simple sanitation.

Too many of us have seen the immediate surroundings of homes maintained in a condition of filth that is simply astounding. At times this is due to thoughtlessness, but probably more often to the mistaken idea that it is an impossibility to create right conditions about stables, outhouses, and even about the kitchen door. Fortunately this state of affairs is gradually changing for the better; practically every farmer is understanding that the health of his family, often their lives, are endangered by insanitary conditions.

In laying out a farm it is too often the plan to arrange the fertile fields for various crops and devote the left-over portion to the house and other buildings. Naturally this is business, but the first thought of the urban dweller is as to his surroundings and the general situation which makes for ideal home conditions. The farmer should demand for himself and his family equal consideration. The one big object in buying the farm and raising products is that the family may have sufficient food and comforts, but their lives must be preserved if there is to be any use for the money that is secured. And that can only be through sanitary surroundings of the home. After all, we live but once, and the years pass swiftly and more swiftly; the time to make a real home is now.

There are four things—fundamentals—to consider in the making of every home; pure supply of water; pumping, storage and distribution of water; durable and simple plumbing system; and finally, and most important of all from the health standpoint, disposal of the farm sewage.

Water Supply

A pure water supply is one of the most important factors in farm life today, as typhoid fever, dysentery and other disorders may be carried by impure waters. Farm water supplies are very subject to pollution. Of 79 typical water supplies in Minnesota, investigation showed that 20 were good and 59 polluted. Twenty-five of those polluted were bad only because of poor surface protection, and could easily have been made safe. Practically all the surface supplies were polluted. During these investigations 23 of the farms examined showed a record of typhoid fever.

Surface water supplies should not be used for household purposes, or for washing milk cans. They should not even be used for laundry purposes unless no other supply is available. Rain water from the roof is often polluted by dust, leaves and the droppings from birds. Any person who drinks water from surface supplies endangers his health if such supplies are not adequately protected and then purified.

The problem of water supply is a long one and worthy of much more attention than it is possible to give at this moment, but be sure that the well, or source of supply, is carefully safeguarded.

Storage and Distribution

Hand operated pumping systems are applicable where small quantities are required for house service only, but in case water is wanted for stock also the use of a windmill, engine, electric motor, or hydraulic ram is necessary. If a windmill is used the storage should be large enough for at least three days' supply, to provide water in case of calm weather. Where the other sources of power are used the storage capacity need not exceed one day's supply. The following table gives approximate quantities of water required per day:

Approximate quantities of water required per day:

	Gallons.
Each member of the family for all purposes will require	25-40
Each cow will require	12
Each horse will require	10
Each hog will require	2½
Each sheep will require	2

The water consumption will vary from day to day and with the seasons. Fire protection should also be considered, and in determining the size of tank the maximum amount likely to be required should be provided. For a family of six persons a 200 gallon supply should be sufficient if the water is used in the house only. On a farm where water is supplied to a family of six persons, 10 horses, 12 cows, 25 hogs and 15 sheep, the daily storage supply should be at least 500 gallons, with whatever additional amount, if any, the farmer deems necessary for fire protection.

Plumbing System

Bear in mind, there is plumbing and plumbing, but get the finest you can. It lasts forever, or at least as long as the most of us will wish for, so a little extra cost at the start may be permitted. But, assuming that a real, for-sure plumber may not be within reach of the pocketbook, here is a suggestion so simple as to be almost laughable, which comes from a publication of the U. S. public health service. It is called Supplement No. 7 of the Public Health Report and is entitled "A Shower Bath for Country Homes." This "plumbing" consists of a rope, a pulley, a hook in the ceiling, the ordinary five gallon coal oil tin can, a stopcock, a rose from the old sprinkler and a galvanized iron tub. Such "plumbing" appliances are crude; not especially sightly or attractive, but they cost little and make for health and contentment on the farm.

But don't stop with these crude appliances. The Mexican labor settlement at San Dimas, described in a recent Cultivator, has in each cottage a shower with concrete floor and sides, with drainage into cesspool. Surely our families are entitled to equal comfort.

Sewage Disposal

One thing should be wiped off the earth, and that is the old time privy vault. It is not even sanitary to discuss it, so we will evade it by referring to the fact that problems of plumbing for rural homes have been thoroughly worked out and suggest that cesspool and septic tank afford a system which is infinitely superior to the old method. Why not secure at once the services of the plumber who will install bath, toilet, lavatory, and hot and cold water and that without excessive cost? Plumbing costs are coming down and by the time the plans have been laid for the addition which will hold the bathroom, reasonable prices will be secured.

The sewer plumbing serves as a drain for the water plumbing. The drainage system should be so constructed as to carry away completely everything emptied into it, and it should be constantly vented, frequently and thoroughly flushed, and have each of its openings into the house securely guarded. All drains, soil pipe and waste pipe should be water tight and air tight. All plumbing should be tested by filling with water or smoke to detect leaks.

Where septic tank is installed the process of sewage disposal is partly mechanical and partly bacterial, consisting of a preliminary septic tank treatment and of final treatment by application to a natural soil by surface or subsurface di tribution, or to a specially prepared filter. The septic tank although air tight and supposedly water tight, should be located as far from the house and the well or spring as convenience and local surroundings will permit, thus reducing the danger of pollution or nuisance in case of leakage or improper operation of the system.

Contrary to the usual opinion, small sewage systems require some watching and care. It is well to study the system and watch the action in the entire plant for any signs of clogging or water-logging. If the sewage is applied continuously to the final disposal system and in such quantities that the system is kept saturated, the filter or disposal area becomes water logged and "sewage sick," and ceases to be effective.

A grease trap acts as a separator of grease and sewage from the kitchen sink or dairy room. If grease is allowed to enter the sewer it accumulates and eventually clogs the system.

Costs of material and labor vary considerably with time and locality, but with the help of a reliable plumber one can work out a simple and economical solution for his problem of sanitation.

Sanitation means better health and greater happiness and besides greater efficiency. Greater efficiency means more wealth. Note the photograph given on third page of this issue of the milking barn on Los Angeles County farm at Honda. The gutters back of the cows are arranged with a slope so that a hose with water under pressure does the stable cleaning in a fraction of the time required by old methods. After flushing the stables the waste is caught by the sluices and carried to alfalfa fields, where it fertilizes and irrigates rather than breeds flies.

Many a farmer with a thinker in operation has appliances not referred to here, but may be these suggestions will start others thinking.

Try it. It pays.

Farmer Needs a Tractor

By C. L. Butler

Prevailing conditions emphasize more than ever before the necessity of the producer employing every agent possible with which to farm more profitably. He must use the tools which will guarantee the greatest economy, the best work, the largest crop yield.

Despite the fact that the economic condition of most coast farmers is better than in many other localities, with a falling market, too many of them are pessimistic in their view of the future. As a matter of fact no farmer can afford to stop expenditures for necessary equipment for in up-to-date appliances and better business methods will come his immediate success, and failure to appreciate this necessity will mean certain loss to him.

Every farmer who operates 20 acres or more, almost without exception, should use a farm tractor; with it he will be able to immediately get more production at a lower cost for the reason that the tractor, by giving a greater amount of power in a single unit will eliminate the necessity for additional manual labor where horses and smaller units are used. In fact, in many places even smaller than 20 acres, where the farmer is sufficiently enterprising, he can after his own work is so quickly finished make good profit with his tractor in contract work for neighbors.

With the tractor less time will be required in producing crops from a given area, and time and labor are the two principal items in producing any crop. Further economy is assured with the tractor in the increasing yield which will inevitably follow from the better work that will be done.

Admitting the proven economy of the tractor and its better work, its possession immediately puts the farmer on a more businesslike basis. As a writer in a recent article in the Chilton Tractor Journal says: "He is immediately independent; less subject to weather conditions; less dependent on his neighbors; does his work with greater precision and certainty; is no longer a slave to menial labor; can use his brains more and his muscles less; a much greater proportion of his efforts are profitable; non-productive work is reduced to the minimum; without increased overhead he can extend his operations."

All these advantages of the tractor are absolutely indisputable, and that tractor farming is prevailing throughout the entire country is definitely demonstrated by the wonderful increase of the numbers used between the years 1915 and 1920. In the former year only about 22,000 tractors were in service, while in 1920 there were more than 200,000, a more rapid rate of increase than was made by the automobile in a corresponding number of early years.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

That "Richest Poor Farm in the World" article speaks for itself, yet we may be pardoned for calling attention to it and to some of the lessons which an open eyed farmer may secure from reading it. Still better would be a visit to the farm a score of miles from the city of Los Angeles. Rather than refer to the many lessons taught by that farm, we will speak of only one, that is the proof it gives of the wisdom of the better sires campaign. The campaign started in the county farm dairy long before the "Better Sires" slogan was put forth by the department of agriculture, a campaign which was inspired by business common sense, about the time Superintendent Wm. R. Harriman took charge of the work under direction of the board of supervisors of the county. It has been so successful in the increase of the products of the 100 cow dairy that the farm now issues a challenge to any other herd of similar size to make a better showing either as to increase in production or net return.

* * *

For the first time since the beginning of the war there is developing a surplus of milk, and the department of agriculture is making investigation of this situation which it announces is in part due to the "flush" season which is just now beginning. It behooves the milk producers to stick together and make proper distribution and possibly prepare for manufacturing plants which will prevent a surplus being thrown into daily consumption.

* * *

Californias' good roads are more inviting than ever. This year they will be the "Open Road" to the foothills, the meadows of the higher mountains, and to the seashore.

* * *

Prof. J. W. Gilmore is now on his way to Chile to investigate as to agricultural conditions and aid the agricultural college of that country during the coming year. It is the custom of large universities to exchange professors, and by request of the University of Chile Prof. Gilmore has been sent from the University of California for this year's service. His headquarters will be at Valparaiso. He will return to California at the end of the year with many ideas regarding Southern hemisphere agricultural practices, and he hopes in addition to be able to find grasses which will adapt themselves to California pastures.

* * *

Pomona has voted emphatically for her "blue law," closing entertainments for pay on Sundays. The movies are consequently blue. Other folks should "worry." The movies have themselves to blame for being characterized as "The World's Worst Failure," as they were by a writer in an Eastern magazine. The vampire stuff and the "sex problems" which have largely succeeded the cowboy inanity have begun to awaken mothers to the fact that the movies may be educational, but too often in the wrong direction, and Pomona is to be commended for reducing the show at least one day during the week. Too bad, for the movies have possibilities for good which are incalculable.

THE QUARANTINE

Not content with the efforts of this country to prevent introduction of new pests which will levy further tribute on agriculture, many Eastern importers are continuing their fight against the federal quarantine service. This is not only unfortunate; it is almost vicious; and the producers of the country should insist that these importers cease their efforts to heckle and embarrass Mr. Marlatt and his corps of assistants.

SOME WEATHER

Last week we made note of the severe weather which had blackened flowers and ruined crops in a great portion of the Middle West. This week the Pacific Coast states from San Diego to Cape Flattery have taken their turn. A flurry of snow or of rain has visited many sections, followed by an extremely hard blow, and the wind by severe frost. Perhaps the most freakish weather was in portions of the Imperial Valley where the newspapers reported a heavy covering of snow. The frost fell heaviest on portions of the San Joaquin Valley. One report wired from Fresno states: "The most damage was reported from a belt east and south of the city of Fresno, about 20 miles long and nearly ten miles in width. In some places in this belt fruit growers reported to the raisin company that from 70 to 90 per cent of the crop was destroyed." According to the same report President Giffen of the Associated says that it is as yet altogether too early to make any estimate of the damage.

WALNUTS

California will grow 70,000,000 pounds of walnuts next year if present prospects are not affected by later unfortunate weather conditions. Owing to the walnut growers being wise in almost unanimously supporting a cooperative association, last year's big output has been disposed of and warehouses are bare of holdover crop. Manager Thorpe and Sales Manager Webber are recently home from a trip east where they succeeded in closing out the old crop. Every possible avenue of distribution was used. Even windows of drug stores, racket stores, five cent stores, big departments, and, of course, groceries, featured and made much of walnuts. This was made possible by the selling of this great crop through the same management which controls advertising and distribution and use of local sales forces.

The whole effort of the association now is to produce a higher grade product in 1921. The association's field force is urging irrigation, spraying, dusting, most thorough cultivation, every step which means a bigger and better crop.

The walnut growers were among the first to realize the necessity of reduction in price if a big crop was to be moved, and the first price named was only about 65 per cent that of 1919. Later a half cent advance was made and only a few weeks ago another advance of a half cent.

The result is that the growers have received more than 20 cents per pound, have their money and are spending it.

EAT FRUIT

Last season's output of walnuts has been cleaned up. The raisin output is provided for. Prune growers are feeling content that program is now under way which practically assures cleaning up the holdover prunes. But many other fruits are still clogging the shelves of retailers, filling the warehouses of wholesalers and even producers. Especially is this true of canned goods. Fruits were put in tins at a time when sugar cost nearly four times as much as it does today. Many grocers still have these cans on their shelves, bought at a price which paid for both sugar and fruit. Some of them still insist on selling such fruits for the full price. As a result the consuming public has refused to buy.

Many canners have united and provided a fund which is being used in nationally circulated magazines to urge greater consumption of wholesome, healthful, delicious California canned fruit. They have likewise made material reductions, of which Eastern dealers are taking advantage, and stocks are being reduced. But if warehouses and canneries are to be emptied so as to permit of normal activities during the canning season of 1921 a vastly greater impetus must be given to the entire movement. The chamber of commerce of Ontario, location of one of the largest cooperative canneries in the state, believes in taking a hand and encouraging greater consumption amongst the people of that community. In addition, it is passing on the campaign to other chambers of commerce and to other communities, suggesting that they join in concerted action to help move this fruit. This, like the other movements, is insufficient, largely because of lack of working capital, but in connection with the other movements it may prove wonderfully helpful.

B. W. Spencer, secretary of the chamber, is taking the matter up with other chambers and urging that it be brought to the attention of all papers and of all grocers who are advertising and endeavoring to secure increased trade. The first idea was to make a canned fruit week drive, but the canneries and others, having outlined their campaign and even appropriated the money for certain lines of work, found it impossible to unite in such a drive. Mr. Spencer, however, is continuing his effort, and in his letter to chambers of commerce calls attention to the big stocks of fruits in hand and to the fact that the growers, and consequently all interests of the state, will suffer seriously unless this holdover crop is practically all consumed before the new crop ripens. In addition, chambers of commerce, farm bureaus or any other of the organized forces for advancing the interests of producers are being used.

Altogether: "Let's eat a can of California fruit."

RAISIN CAMPAIGN A SUCCESS

As we go to press our regular Central California contributor sends in statement that the raisin campaign is a huge success. It arrives too late to get more than the once over on this page, so we summarize: "Ninety-two per cent of the raisin growers of the state have signed the contract." The campaign started on February 8. No time limit was set, though the hope was expressed that 60 days would cover the entire period. By Saturday night, April 2, the 92 per cent mark was reached, and while the campaign was seven days shorter than the previous one, the loyalty of the growers and the punch given by the effort of the department of justice to do this great industry an injustice aided in the whirlwind finish. The gain in signers of the new over signers of the old contract was 1,137; the number of contracts signed, 12,131, covering 12,914 ranches; additional contracts on 4,834 acres of black grapes.

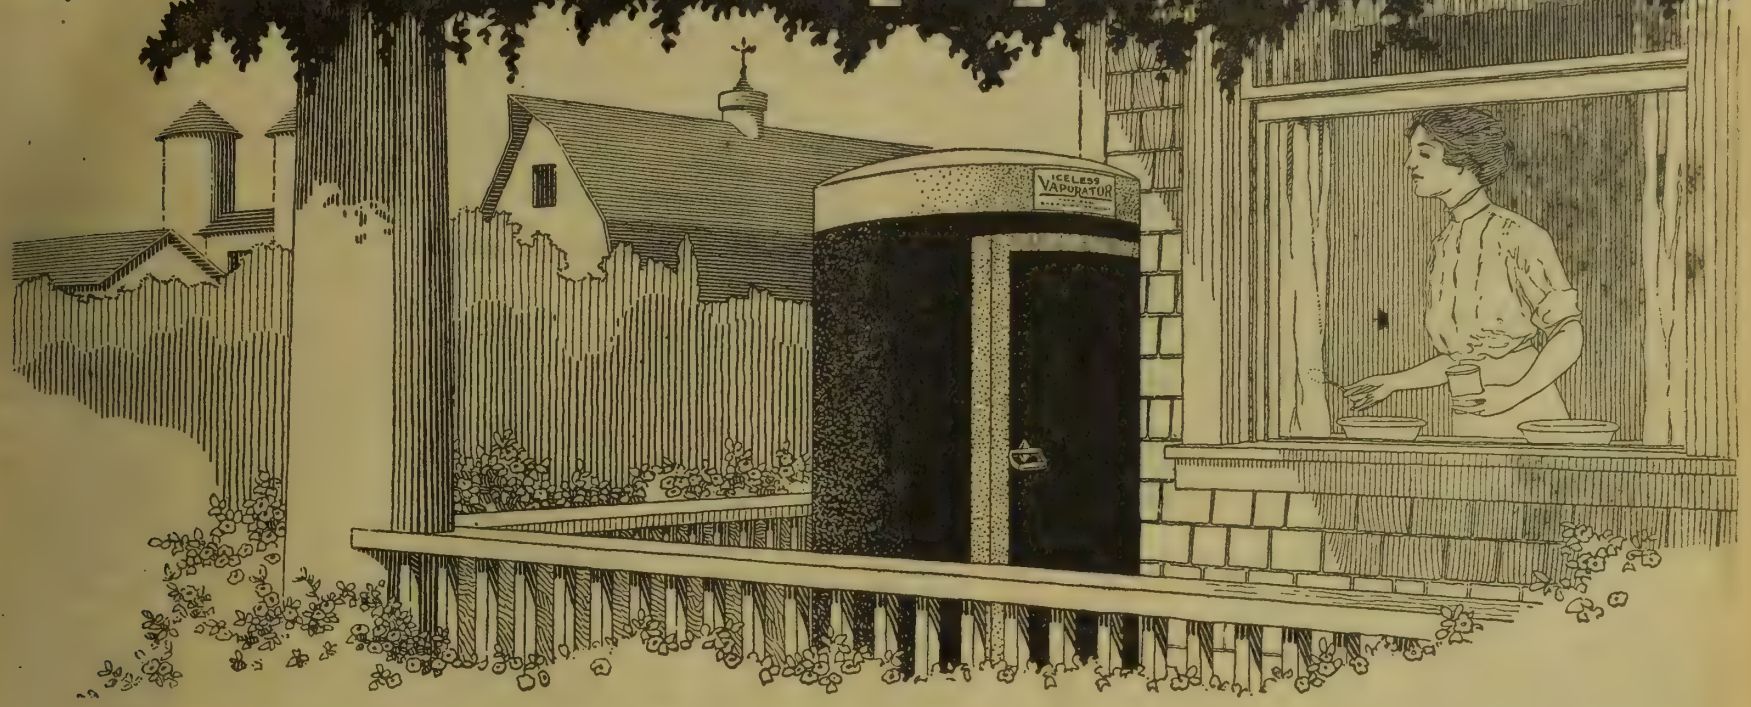
While the active campaign is now ended, the raisin growers still wishing to cooperate may sign until April 16. The company now offers the privilege of cancellation to every signer who will make affidavit stating that he was coerced or intimidated into signing or that he was led to sign through misrepresentation.

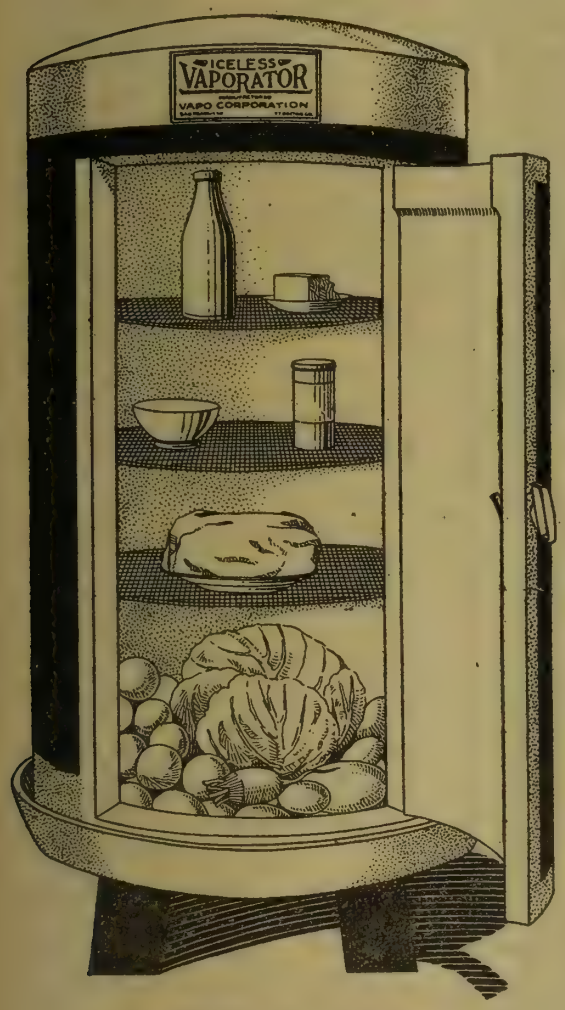
GIFFEN SAYS:

President Wylie M. Giffen issues the following statement:

"We consider this campaign a great achievement, but it is not the achievement of an indiivdual, nor is it the achievement of any group of individuals—it is the achievement of an entire community and simply illustrates again the thing we have often said, that an organization of this kind can only live as it continues to merit the confidence of the community in which it operates. From this point of view this has been the most successful campaign we have ever had, as without a single exception every community, every newspaper, every civic organization, ladies clubs, the growers committees and literally thousands of individual workers from every calling in life have done their part. So many have done noteworthy work that it would be impossible to pick out for honorable mention any individual or any single organization. So much has been done, and the spirit has been so fine that it is impossible for us to express our appreciation, but so that those who have worked may not have worked in vain we here and now dedicate our lives anew to the task that lies before us. Yesterday it was the ambition of our lives to bring this campaign to a successful conclusion, but already the ambition of yesterday is but the stepping stone for the ambition of today—to make the success of yesterday the beginning of a new and better life for the Associated Raisin Company. No organization has ever been paid a finer tribute than has been paid to ours in the last few weeks by the universal support given our campaign. Yesterday the crowning ambition of our lives was to succeed—today it is the higher and better ambition, to be worthy of your confidence that your work may not go unrewarded."

The last word in modern Farm Equipment





The Iceless Vaporator stands 5 feet high. Diameter, 28 inches.

Food Chamber is 43 inches high. Diameter of Food Chamber is 24 inches (so you see what a goodly quantity of food stuffs finds place in the Iceless Vaporator).

The dimensions of the door accommodate milk pans of the largest size.

The constant circulation of air is achieved by such cautious screening of openings that the Iceless Vaporator is proof against ants, insects, anything that either creeps, crawls or flies, and is also dirt-proof.

$90.00

All these wise provisions are set forth in the booklet *"Refrigeration Without Ice"* which we shall hasten to mail to you if you will send us your address.

TO DEALERS

There will be one Iceless Vaporator dealer in each town. Behind him will be put a forceful advertising campaign. Write for agency.

The ICELESS VAPORATOR brings the convenience of the city ice box to the farm.

Place the ICELESS VAPORATOR on your back porch, or under a tree in your back yard. Every two or three days fill the tank with water. Evaporation does the rest. It's always cool inside. No ice to worry about.

The ICELESS VAPORATOR is made of a composition which is virtually a stone sponge. The outer wall absorbs the water until thoroughly saturated. Evaporation then takes place.

The inside of the ICELESS VAPORATOR is cool and dry. Easily cleaned. No corners to catch the dirt. The galvanized wire shelves are sanitary and permit circulation.

The food is preserved at an even temperature, thus keeping it fresh and sweet.

Once installed, the ICELESS VAPORATOR becomes a lifetime friend.

Ask your dealer about the ICELESS VAPORATOR, or write us direct.

Walnut Selling Campaign

CALIFORNIA'S 1920 walnut crop, second largest in the history of the industry, is sold out slick and clean. This was learned when the California Walnut Growers Association began mailing out to the growers their checks for the final payment on first pool shipments.

That the association has scored a real sales triumph in disposing of its gigantic crop is evident to those who know that immense quantities of other California food products still remain unsold in the principal markets of the country.

C. Thorpe, general manager of the association, credits the accomplishment to even distribution of the product, persistent sales efforts, warehousing to keep walnuts within reach of jobbers who were financially unable to place heavy orders, and fair prices which retained the confidence of the consumer.

The association announced a cut of 30 per cent in its opening prices last fall, being the first distributor of a nationally used food product to slash prices sharply in an effort to get back to pre-war conditions. It was confronted by the handicap of a heavy carryover from the 1919 crop and hindered by almost ruinous competition from cheap imported walnuts, but the high quality standard was maintained and the California walnut met with such favor that during the closing weeks of the season the demand strengthened and the growers were able to clean up the crop completely at prices substantially stronger than those which were named at the beginning of the season.

Some unusual sales angles were injected into the walnut selling campaign this year. A furniture store in Los Angeles displayed walnuts in its show windows for several days, while a lingerie shop was selling walnuts as a sideline. The five and ten cent stores took a flyer in walnuts for the first time and one establishment reported sales ranging between $400 and $700 a day for many weeks. This led the buyer for a chain of Eastern racket stores to try out California walnuts and his stores disposed of 2,500 bags of them, expressing a willingness to take another 1,000 bags, but being unable to obtain them.

Realizing that markets were in a badly demoralized condition, General Manager Thorpe met the emergency resultant from hand-to-mouth buying by shipping walnuts to warehouses in all parts of the country, where they could be drawn out by dealers as fast as on-hand stocks could be sold. This kept the public supplied with walnuts constantly, maintained even distribution and gave the association the full benefit of consumer appetite which was created by its advertising campaign.

General Manager Thorpe and Sales Manager Webber spent nearly two months in the East, after the holidays, stimulating walnut sales by personal contact with the trade. Spending nearly a month in New York City, they succeeded in disposing of 1,500,000 pounds of walnuts in the one market. As they worked their way westward they assisted the association's agents in cleaning up walnut stocks in all the leading cities. Shortly after they reached home it was announced that the crop had been completely sold out.

THE FARM BUREAU IN ARIZONA

By M. E. Bemis

For several years there have been more or less scattered organizations of farmers that have generally been affiliated with the national organization of farmers which about one year ago held its first annual convention under the name of "The American Farm Bureau Federation." These farmers' organizations, many of them, were the successors of the old farm improvement associations.

There have been several of these in the northern part of the state and in the Gila Valley and a few in the Salt River Valley. Considering the big things which the national organization is accomplishing, it appeared surprising that there was so little interest taken in these organizations.

President C. S. Brown of the state organization attended the second annual convention of the national organization and persuaded President Howard of the national association to send organizers to Arizona to perfect the organization.

At the annual meeting of the state organization which was held at Tucson in January a representative of the national organization was present and the delegates were so much impressed with the necessity of forming local association in every community and a strong state association that a committee for organization was appointed and the request for national aid in organizing sought. At this meeting after some discussion the annual dues were raised to $10.

During March, S. Fred Cummings of Iowa, a national organizer, has been devoting his time to working with President Brown in Maricopa County. The result is that local organizations have been formed in nearly every community and more than 1,000 members secured. This is by far the largest membership of any farmers' organization here, and it is predicted that this organization will prove a powerful influence for bettering the condition of the farmers of the state.

In addition to working with the national organization it is expected that a local exchange will be built up which will be of material help. The movement has met with the hearty cooperation of chambers of commerce and business men, all of whom feel that the success of the farmer means success and prosperity to all, and

ONION GROWERS WILL USE U. S. GRADES

THE shippers and growers of Bermuda onions in the Coachella Valley at a meeting on March 29 adopted the U. S. grades for use this coming season. They also decided to use the state shipping point inspection service on every car. This action ties the deal up very definitely with the state and federal authorities and indicates a big step in advance for the industry as a whole.

Shippers of California perishable products have contended for several years, and with good reason, that they should be entitled to an authoritative inspection at shipping point such as is available to receivers at destination through the U. S. bureau of markets. Repeated efforts of shippers in this direction finally resulted last summer in the reorganization of the office of standardization of the state department of agriculture, cooperating with the U. S. bureau of markets, and obtaining the services of F. W. Read, L. J. Weishaar and H. H. Warner who had been for several years federal inspectors at destination, and all of whom had had considerable commercial experience with the trade. These men have succeeded in organizing, under Mr. Read's direction, the only state shipping point inspection service in the country, cooperating with the U. S. bureau of markets.

This inspection is made only at the request of the shipper or Eastern buyer, carrier or some party having a legitimate interest in the product. A food products inspection certificate, practically identical in form with that used by the federal government in the receiving markets, is issued to the applicant on every car inspected. Statements on these certificates cover, in addition to manifest and method of loading, a detailed description of the quality and condition of the products examined. The attorney general of the state has ruled that statements on these certificates are receivable as prima facie evidence in all courts in the state. At the present time this shipping point inspection certificate is the best legal evidence the shipper can secure in support of railroad claims or forcing the buyer to accept cars on the original f. o. b. purchase price even though they may arrive on a declining market.

Although the service is comparatively new some 5,000 cars of fruits and vegetables have been inspected at the request of shippers in all parts of the state, and as the trade becomes more familiar with the nature of the work the service is being used more extensively.

The transcontinental railroads are watching the success of the work very closely and traffic interests for the shippers say that claims receive preferred attention by carriers where the state shipping point inspection certificate can be introduced into evidence. In some cases, the carriers themselves have requested inspection on cars loaded with products which they felt might be the subject of later claims.

The inspectors in this service are carefully chosen and are men who, without exception, have had commercial experience either in the produce business or as growers. They are carefully trained by the same methods as employed in the federal food products inspection service and through the cooperative arrangement with the U. S. bureau of markets, the same terms and methods of describing the products are used by both the state inspectors at shipping point and the federal inspectors at destination.

During the period of the onion shipments from the Valley an office will be located at Coachella and a force of inspectors working under the direction of H. H. Warner, district supervising inspector, will provide the same thorough going inspection in the fields and at the packing sheds that has been available to shippers of other products within the state for the past nine months.

QUARANTINE ON CITRUS

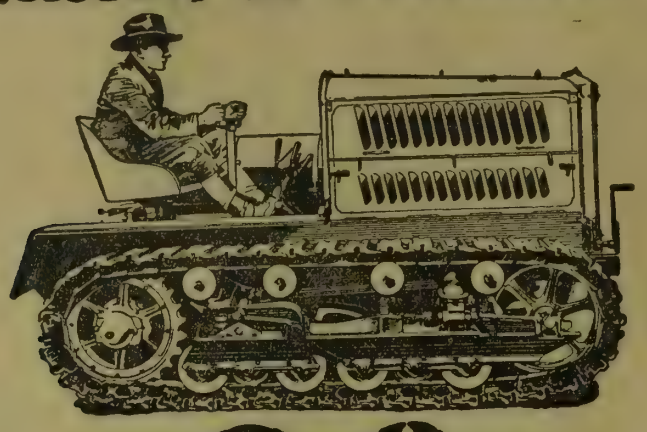
A case of unusual interest to orchardists and nurserymen is now on trial before Judge Rogers of the superior court of Ventura County. R. M. Teague of San Dimas is seeking an injunction to restrain Horticultural Commissioner Call from interfering with delivery in Ventura County of a shipment of 513 citrus trees, claimed to be free from any and all pests or diseases known to infest citrus stock.

The trial opened on March 25 with Mr. Erskine, manager of a packing house in the Fillmore district, on the stand. He exhibited lemons infested with red scale and told of six or eight orchards in the Bardsdale district infested with said scale, though not seriously. Commissioner Call testified he knew of red scale in orchards of the Fillmore district but did not believe it existed in any other district of Ventura County. He issued a quarantine against the Teague shipment on March 9, without having inspected same, on the ground that a previous quarantine lies against the San Dimas district and that he has (reading of state law) "reasonable cause to presume" that said section is infested with red scale.

Former Commissioner Brock was examined at length regarding infestation of red scale in various parts of the county during the eight years of his holding the office. Mr. Steele, foreman on the Teague nurseries, testified as to what part of said nurseries shipment came from; treatment given trees before shipment; absence of red scale, so far as he knew; double fumigation, by Teague, of an orchard near by where a few infested trees were found by the local horticultural inspector, the whole orchard being afterward fumigated by owner. At this point the case was postponed to April 1.

On the latter date the testimony of both sides was completed and did not differ in character from that herein quoted. The case will be submitted on briefs and Judge Rogers is expected to announce his decision about a week hence.

A Tractor that meets every requirement of orchard work



CATERPILLAR
Reg. U.S. Pat. Off.

5-TON ORCHARD TRACTOR

Here, in the famous 5-Ton "Caterpillar" Tractor, is an orchard tractor that solves your particular power problems—fully meets your special needs. It has power—big power and that's your foremost essential. With the 5-Ton you can plow or subsoil deep, finish up your work quickly, keep a safe distance away from the trees.

And the 5-Ton's power is compact power—the tractor is narrow, low-down, has clean, smooth lines, with nothing projecting to knock off fruit or catch low-hanging limbs. "Caterpillar" 5-Ton Tractors' wide range of speeds —1½, 3 and 5¾ miles per hour —gives it splendid versatility, makes it adaptable to a wide range of work. The 5-Ton turns short, pivoting on either track.

Most important of all are the factors of long life, low upkeep cost, low operating expense, in which the "Caterpillar" 5-Ton Tractor holds a position of superiority not even approached by any other orchard tractor—a position established by its achievements, on two continents, in every kind of work, under every conceivable condition.

There's only one Caterpillar Holt builds it

Investigate this Tractor now. Every day that you wait delays your profiting by this Tractor's ability to decrease your orchard costs.

IMPERIAL VALLEY COTTON

Those who do not know the amount of cotton that comes into San Pedro from Imperial Valley and Arizona are amazed when they take a walk about the cotton warehouse in the outer harbor and see about two city blocks of the cotton bales waiting to be compressed before shipping out.

There are 9,000 bales there at the present time, insured for a million dollars. Strange to say, a large shipment of this cotton is to go to South Carolina, which is one of the largest cotton growing states in the South.

Imperial Valley Cotton
Ready for the compress on the wharf at San Pedro Harbor.

The bales of cotton when compressed are reduced over one-half, so that after compression two bales occupy the space of one. A large shipment of cotton was recently sent to Japan by the Japanese steamer Chicago Maru.—Delphia Phillips.

AVOCADO WINDBREAKS

Avocados make a good evergreen windbreak, grow very rapidly for a fruit tree, do not rob surrounding soil as do eucalyptus and peppers, and may prove of considerable commercial value. When you eat any one of the many named varieties, save the seed, plant it and successive seeds. Place the trees in the row ten feet apart. It may be that fruits will prove few and poor, but you still have the windbreak. All may prove to have a "home" value, all may have commercial value. Some may prove to have fruits better than the named parent; if so, you have made a very profitable investment. In using avocados for windbreaks you get at least an effective one and therein cannot lose; the plantation may prove the most valuable, for the space occupied, that the ranch holds. When young the trees are more tender than oranges, but when of several years growth are hardier.

LAKE COUNTY PLANTING

Horticultural Commissioner Fred G. Stokes of Lake County writes that the orchard trees planted in that county this season aggregate 77,748 and grapevines 6,000. The trees are divided into the following varieties: Bartlett pears, 52,122; prunes, 20,994; almonds, 2,988; apricots, 500; walnuts, 394; miscellaneous, 750.

THE RICHEST POOR FARM

(Continued from Cover Page.)

nated with alakli. The best of it was planted to alfalfa and to silage, garden and other crops. Other portions were liberally underdranied, work which is still continuing and bringing additional acres under higher productivity.

One result of this improvement through draining and the bettering of its general management is shown by the fact that in 1913 and 1914 the total return to the county from the farm was $20,785. The almost spectacular rise in the value of the products of the farm is shown by these figures: 1914-15, $23,341; 1915-16, $59,261; 1916, 17, $92,072; 1917-18, $115,562; 1918-19, $131,792; 1919-20, $149,322.

On the other hand, covering the same period, the net costs per capita for the inmates of the institution, covering feeding, care and clothing, are: 1913-14, $.838; 1914-15, $.599; 1915-16, $.381; 1916-17, $.3365; 1917-18, $.3703; 1918-19, $.43; 1919-20, $.5025.

The chart or "curve" visualizing these figures emphasizes the fact that the war had an influence on the H. C. L. of county charges as well as the rest of us, for the bottom was reached in 1917 when the daily cost was reduced to $.33 2/3. From that time there was a gradual increase until January 1 of this year, when it reached slightly over $.50. Food price reductions are expected to bring this back ultimately to a lower level.

Highest tribute is due to William R. Harriman, superintendent of the farm, for this increase in revenue and decrease in costs since he took charge of the farm in 1913.

The management of this county farm, the county hospital, the Olive View Sanitarium, the outdoor relief and the county cemetery are all under the department of charity which is directed by the board of supervisors through a committee of the board, together with a corps of superintendents. During much of the satisfactory growth of the farm Supervisor Dodge was chairman of this committee. For some time now Supervisor Bean has been chairman and is showing great interest in the efficiency of its work. The supervisors of Los Angeles County are Messrs. Dodge, Bean, Cogswell, McLellan and Woodley.

By Jack Klein

Los Angeles County Farm has the distinction of owning the greatest producing herd of 100 cows in the world. During the past year an average of 101 cows were in milk and produced 1,329,277 pounds of milk. The 101 cows averaged 38.5 pounds of butter fat per month per cow. This production has never been equalled in any herd. The greater part of these cows are very high grade Holsteins but the farm is slowly acquiring a herd of pure breds.

Three of the grades exceeded 736 pounds of butter fat and the best one made over 800 pounds. The best 20 cows averaged 15,680.8 pounds of milk. One grade cow has in four years produced over 35 tons of milk. During 1920 the farm was awarded six first prizes and nine second prizes in the contest carried on by the Los Angeles County cow testing association, and the herd has twice won the $25 monthly prize offered by the California Cultivator in the state dairy cow competition.

The herd at present numbers 192 grades and 78 purebred animals. Of the pure breds Whittier Pontiac Netherland 4th is one of the best known as she won $36.50 from the Holstein-Friesian Association which was just ten per cent of her original cost. Sunland Peerless Tulip Korndyke recently finished a seven day record of 28.6 pounds of butter and Henrietta Luecke Colantha has made 385 pounds of butter in six months as a junior two year old.

This herd is an excellent example of the use of pure bred bulls on grade cows. The original sire was King Jones Homestead, a double grandson of Fobes Tritoma Mutual De Kol, who was used almost entirely on the grade cows. His daughters averaged nearly 25 pounds more fat as two year olds than their dams did as aged cows. He had one daughter who made 18,000 pounds of milk and 627 pounds of butter when only two on two time dairy milking.

King Segis De Kol Mead 3d has been used on the old bull's daughters

Why Pay Fuel Bills?

¾ of Your Hot Water Free!

Yes, for eight months in the year, nature will furnish you all the hot water (*hot* not warm) you can use and not a cent to pay.

And on the sunny days of the other four months the water will be heated enough so that little artificial heat is necessary.

Imagine the pleasure and satisfaction in being able to turn on the hot water faucet in your bath tub, or at any other fixture in the house and draw hot water anv time.

And how much greater the satisfaction when you know that it is not costing you a single cent.

—there is plenty of heat in the sun.

—water readily absorbs this heat under the "Day and Night" plan.

—the sun heated water is then stored ready for use in the bath, kitchen or laundry.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Avocado Seeds

Have a seed of avocado. Does it need any particular soil? In planting should the meat be left on the seed? What depth should it be planted? Do the trees have to be budded?—Subscriber, Buena Park.

Avocados are not at all particular as to soil. The seed is best washed clean of meat or flesh. Plant small end of seed upward, so that top of seed is but lightly covered with soil. No good fruits can be assured without budding and some seedling trees never bear in California. We would not think of giving space to a seedling tree unless it was from a high class fruit and we were curious to know what it would produce when of fruiting age.

Girdling to Induce Bearing

Many inquiries are being made at this time of the year regarding the pollination of various plums and almonds. It is altogether too late this year to do any grafting, but if one will girdle several, but not all, of the main branches of the non-bearing trees it will induce them to set fruit when they would not otherwise. One should remove a ring of bark about three-sixteenths of an inch wide by cutting in with a sharp knife. About one-third or one-fourth of the main branches should not be girdled. Work should be done while trees are in bloom or very shortly thereafter. Branches not girdled will not set fruit but should be left to keep roots in good condition. Girdling will leave no permanent injury and will have to be done every year until pollinators are put in. University of California bulletins recommend Wickson as the best pollinator for Asiatic varieties.—Chas. S. Knowlton.

Pruning and Spraying Oranges

What is the best time to prune orange and lemon trees and what spray is best to use and when?—Subscriber, Los Angeles.

It is rather difficult to answer such a general question for there are some dozens of different pests affecting the trees, and the wash which will effectively control one is of little or maybe of no value in controlling another of the pests. If it is fungous trouble a spray may be used which would be of no value whatever on an insect, therefore the first determination is what pest is affecting the trees. If it is black, red or purple scale fumigate some time after the fruit is, say, half or two-thirds grown and before pruning time. If it is red spider or thrips spray now with lime-sulphur, either dry or wet. If it is the citricola scale fumigate between the first of July and the middle of August. If it is Fuller's rose beetle, which is sometimes serious enough to be treated, control by banding the tree with Tanglefoot or other sticky band. If it is mealy bug get from the state insectary a colony of cryptolaemus or fumigate double strength. If it is orange aphis spray with tobacco extract or kerosene emulsion. The list of fungous troubles is almost as long, and it would be best to study the trees to determine which spray would prove effective.

TIMKENS MEAN - MORE *and* BETTER FARMING - BY POWER

A Book Of Interest To Farmers Everywhere

During a period of more than twenty years, 57,000,000 Timken Tapered Roller Bearings have been manufactured on an unchanged principle.

Because of their simplicity of design—

ease of installation—

compactness of mounting—

unparalleled performance—

uniformity of quality—

ability to carry radial loads, thrust loads, and all possible combination loads—

and their adjustability for the wear that *must* follow all motion, Timken Tapered Roller Bearings are playing an important and intensely interesting part in the development of More and Better Farming By Power.

While watching 57,000,000 Timken Tapered Roller Bearings at work we have learned much about the application of power to the farm. A descriptive analysis of this valuable information has been got out in a booklet, a copy of which should be in the hands of every farmer in America.

A postcard from you, addressed to Department B will bring your copy.

When you write for the booklet it will be of great help if you will give the size of your farm and its present motor equipment.

TIMKEN Tapered ROLLER BEARINGS

Rotation Best Remedy

In this locality we can raise a crop of milo after a crop of barley has been taken off but if the ground is sowed to barley again in the fall the crop is very light. What is the limiting element in the soil which causes the light crop? After barley has been taken off could the ground be irrigated and sowed to barley and vetch and make a crop of hay or pasture in time to seed to barley in January, or does vetch do well in the valley? Soil is sandy silt. — Subscriber, Madera County.

This is simply a question of learning the old, old lesson of rotation and in addition the further lesson that the soil, as well as the human, needs a rest, at least unless fertilized and stimulated to a point of perpetual work by expensive fertilization methods. Again, it is very probable that the following of barley with one of the sorghum grains may simply exhaust soil moisture. With the amount of rainfall in Madera County it must be borne in mind that storage from one season to the next is safest where one is working the soil to the limit. However, with the irrigation which is possible in this case this would not be a limiting factor. Instead of vetch perhaps one would find profit in growing melilotus indica, the ordinary sweet clover, pasturing it lightly and then plowing under. Of course this prevents continuous use for crops but it does put the soil in excellent condition so that greater crops may pay for the soil rest.

Mistletoe

What can be done to keep mistletoe off the fruit trees? It's getting on my pomegranates. — Subscriber, Porterville.

This is a question we will pass on to our subscribers. Mistletoe is proving a serious pest in some sections, especially in some portions of Tulare County. Is there a spray that will prevent germination of the seed or is cutting out the only remedy?

Seedling Olives

Will olive seedlings bear the same or as good fruit as the fruit from which the seed was taken? Would it be advisable to plant cuttings or seed? —Subscriber, Hemet.

No, the olive seedlings will not come true to the parent tree and presumably most of the seedlings would yield a fruit inferior to that of the parent. Of course it is best and practically the invariable practice to grow olive trees from the small herbaceous or even the large woody cuttings 10 or 12 inches long and perhaps one-fourth to one-half inch in diameter. The fruit on these cuttings will usually

The best clothes for rough work are

Number of Citrus Fruit to Box

How many lemons are there to a box and how many oranges? What is considered a good yield of oranges or lemons per tree? Are orange and lemon blossoms self fertilizing?—Subscriber, Hemet.

The number of lemons per box will vary from 180 to 560. The standard pack for oranges as used by the trade of California includes the following sizes: 80, 96, 112, 126, 150, 176, 192, 200, 216, 288, 324. Pomelo or grapefruit are usually packed in four sizes: 36, 48, 80 and 96. A good yield of a fully matured orange tree may be said to range from six to 12 boxes. A large seedling tree will, however, sometimes bear twice that amount while a poorly cared for tree may yield half the lower figure given. The same range prevails with lemons, depending upon conditions. The bearing of a tree is like the work of a man—it all depends. Citrus trees have perfect flowers and are self fertilizing.

Protein in Beans

What is the percentage of protein to fat in Blackeye beans?—Subscriber, Hemet.

We are unable to find any publication showing analysis of Blackeye beans. However, Navy beans, cow peas, field peas and other leguminous seed run very similar as to the amount of nutrients. The Navy bean for instance shows crude protein, 18.8; carbohydrates, 51.3; fat, .8; with a nutritive ratio of 1:2.8. Cow peas: crude protein, 19.4; carbohydrates, 54.5; fat, 1.1; nutritive ratio, 1:2.9. The horse bean, however, has more protein, the following being digestible nutrients: crude protein, 22.8; carbohydrates, 49.1; fat, .7; nutritive ratio, 1:2.2.

Not Bearing

I have a pear tree and an apple tree that were full of blossoms last year but did not produce any fruit. This year they are doing the same. The blossoms look fine and tree shows no signs of scale. Having had the place only one year I cannot say if they are of good stock or not. Please advise cause and what to do for same—Subscriber.

It is impossible to judge as to the cause of barrenness without some knowledge of the age of the tree, weather at the time they were in bloom, as to whether they were winter pruned and other conditions which might have some effect on the setting of the fruit. It is possible that this year there may be full crop, but watch closely the conditions and if possible get behavior of trees in former years. Another year application of nitrate of soda or other quick nitrogen bearing fertilizer, ringing the branches of the trees or other artificial treatment might prove beneficial.

Siphoning from Well

I have a well on a hillside from which I would like to siphon the water into a reservoir which I plan to build a few feet below the level of the water in the well. I have tried the siphon through about 200 feet of three-fourths inch pipe. It runs all right for a while and then gradually diminishes and finally stops altogether. Why does it not keep on running? If you have any information or know of some one who can post me it will be appreciated.—Subscriber, Arroyo Grande.

Our first suggestion is that this

RUMELY OILPULL TRACTOR

Proved By Twelve Years' Farm Work

Year after year of the hardest kind of farm work—plowing sun-baked virgin prairie sod, discing, harrowing, belt work, road work, etc.—has proved the supreme fitness of OilPull tractors.

This dependability and service has been remarkably demonstrated by the first OilPulls built, that are still working—year in and year out continuous performance that gives the only real basis upon which a tractor can be judged. In these twelve years the OilPull tractor has built up a record of continuous, reliable, economical operation, unequaled in the tractor industry.

Successfully burning the lower grades of fuel oils—thoroughly cooled by oil—lubricated by remarkably efficient force feed and splash oiling systems—speed automatically regulated by a throttling governor—these are some of the exclusive OilPull features.

The Rumely OilPull may be had in sizes from three to ten plows, standard in design and construction—a size to fit any farm or job.

An OilPull will enable you to increase yields and profits as well as greatly reduce the hard work in farming.

Ask for literature and list of owners who have been using OilPull tractors in California 5, 6 and 7 years.

"THE BOSS" TREE PROTECTOR

We are the originators of the YUCCA PALM tree protectors and they have been on the market for 30 years. The color is light—a perfect protection against Rabbits, Grasshoppers, Heat of the Sun, Borers and Frost. It is quicker to put on than any other tree protector in the market. No strings to tie—ready for immediate use. Is open grained and allows free circulation of air. Can be readily taken off to spray the trees. Not affected by rain

Cheap—Durable and Guaranteed to Give Satisfaction

We make all widths and sizes. Ask your Nurseryman about them or send direct to us for free sample and prices.

KEROSENE ENGINES
OTTAWA LATEST DESIGN

Durable, Powerful, Reliable, Massive. Built to last; to do hard, heavy work. Uses Cheapest Fuel. Pull ¼ to ⅓ horse-power more than rated. Lowest Prices. 3 Months Trial. Easy Terms. Sizes 1¼ to 22 H-P. Easy to start. No cranking. No batteries. 10 Year Guarantee. Most practical engine ever built. Engine book free. A postal brings it.

THE OTTAWA MANUFACTURING CO.
512 King Street, OTTAWA, KANSAS

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

trouble may be caused by leaks in the pipe through joints not perfectly tight or through airholes. J. B. Neff gives suggestion that perhaps it may be caused by "swamp" or natural gas in the gravel bed from which the water flows. It is quite often the case that wells supplying very good water still are troubled with gas that may even collect in sufficient quantities to be ignited by a match. Water from such a well would of course soon put a siphon out of commission. A suggestion to overcome this difficulty would be to use a large metal plate at the bottom of the well, placing the end of the siphon just a little above the center of the plate. As the water rises around the edges of this plate the gas is allowed to escape upward and the gas-free water which would gather in the center would doubtless keep the siphon running much longer than at present. Another method, and perhaps a simpler one, is to tie over the end of the siphon a good sized tin can so that the water flowing over the edges of the can and into the siphon would be freed of the gas before entering the siphon.

MAKE YOUR SOIL YIELD MORE
USE TORO BRAND AGRICULTURAL SULPHUR

This has increased crops up to 500%. It prevents wire worms, smutty grain and potato scab. For Lime-Sulphur Solution use DIAMOND "S" BRAND REFINED FLOUR SULPHUR. Cost of the Pests

Answering our inquiry as to the cost of economic poisons to the orchardists of California, Prof. George P. Gray, now of the state department of agriculture, refers to his statement in the monthly bulletin for March, 1919, in which he said: "Two and one-half millions of dollars was the estimated cost of economic poisons used in California in 1916. This estimate was based upon reports from 28 county horticultural commissioners, representing about 71 per cent of the bearing acreage of fruit in the state. The cost for the season of 1917-1918 is estimated at nearly three millions of dollars. This estimate is based upon the more nearly complete returns of 41 commissioners compiled in the following report."

Sneezing Rabbit

I have a buck rabbit and he sneezes all the time and at times he seems to choke. People have told me he has the snuffles. Can you suggest a cure for it?—Subscriber, Hynes.

A sneezing rabbit does not have the snuffles any more than a sneezing person has pneumonia or quick consumption, though a neglected cold in either case may bring on either disastrous end. Your rabbit may be sneezing because of a cold or dust in hay or grain or depleted vitality and inherent weakness or accumulation of filth in hutch or on ground under it. Treat colds and prevent them with open air and sunshine as the main thing, assisted by a few drops of this mixture in nostrils daily: 1 ounce olive oil, 10 drops creolin, 3 drops eucalyptus oil. Mix and shake well before using. We would also suggest the purchasing of a good rabbit book and a reading up on this subject in all its phases.—W. D. W.

Figs Not Bearing

I have two white fig trees in my back yard, located about 60 feet apart. The smaller tree, which is near the house and partly sheltered by one wing, produces a fine crop. The other is considerably larger and usually sets a fine crop which practically all drops before they get as large as a marble. I understand insects of some sort, or other figs, can be obtained to make them mature. Is this true, and if so where can same be obtained?—Subscriber, Sacramento.

It is possible this is the Smyrna tree which calls for the pollen being introduced into the blossoms from capri or other trees, and to accomplish this the capri figs which have been colonized with the blastophaga should be secured. Many fig growers at Fresno make a business of supplying these figs to the trade. They may probably be secured during the months of May and June.

Gypsum Application

Answering question of subscriber at Thermal as to the best method of applying gypsum, quantity, season, etc., Dr. R. R. Snowden writes: "The usual time for applying is in the fall, if there is a choice of seasons, but no one should wait until fall if the gypsum is needed and obtainable. It should always be in moderately fine powder, spread broadcast over the land and plowed in. If the soil is in need of gypsum it would be well to apply two tons to the acre the first season, then one ton to the acre for a few seasons, and after that 500 pounds to the acre per season would be sufficient."

Arsenate on Green Corn

I saw by your paper last summer to use a little dry arsenate of lead on the tips of the ears when the silk begins to show. Would it be perfectly safe to use the corn fodder for feed after using that?—Subscriber, Chula Vista.

Yes; the small quantity which is sufficient for the worms would not affect the feeding value of the fodder. Of course one could powder on so much as to possibly endanger stock but not with a reasonable amount. Put the dry arsenate in small duster or blower and puff only a very small quantity above the forming ears of corn as soon as silk begins to show. Where one has no duster with small bellows, by being careful he may use sack of coarsely woven muslin or cheesecloth and dust very lightly over the forming corn.

Poison for Cutworms

What is best kind of poison to mix up for cutworms and how close should one spread it if cutworms are bad?—Subscriber, Chula Vista.

For cutworm poison see page 453 of the Cultivator of April 2.

Garden Tractors

I wish owners of garden tractors would give to those of us who are small tract owners their estimate of the value of garden tractors in doing the work on 2½ to 5 acres of garden or even of orchard.—Subscriber, Chula Vista.

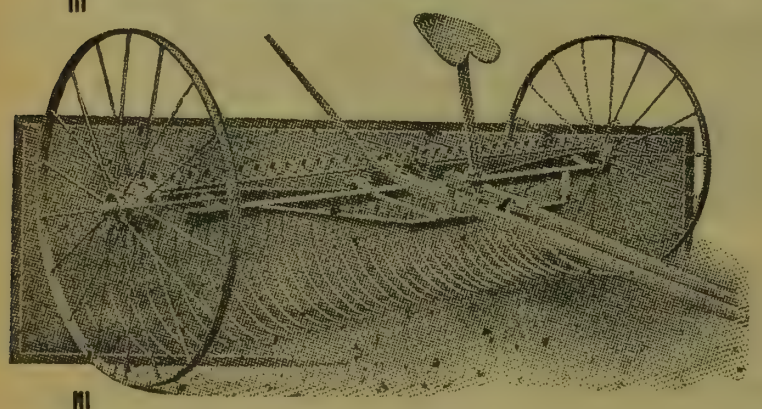
We will be glad to hear from subscribers who have had experience with these little labor savers.

HARMONIOUS PLANTING

In developing rural gardens do not make the mistake of copying city gardens. Make the most of the fortunate opportunity to harmonize your grounds with the natural or wild landscape surrounding. Use native trees, shrubs and lowly plants liberally and in zones. Do not mix them. Have all of one kind in one place or zone, but do not have each plantation severely outlined or all of one size or shape. If you have two species of ceanothus or mountain lilac, one of white flowers, the other of blue, have a mass of each, different in shape and size, and allow them to merge, not stop abruptly facing each other, like a pair of fighting roosters. Allow a few plants of each to run by the general outline of each so they are figuratively "spliced." In nature you find them so disposed.

WARRANTED!

Thomas Steel Rakes and Crown Mowers



made of the best material money can buy—carefully built — factory tested — sold under 12 months' guarantee.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Joint Deed

Husband and wife have a joint deed for their ranch. The wife has paid in four times as much as the husband. Can the wife make a will for her share of the property to whomsoever she pleases? If she cannot what should she be entitled to will? Is it necessary for a will to be made when there is a joint deed? — Subscriber, Anaheim.

The property being held in joint tenancy with right of survivorship, it does not matter as to the proportions of the payment. Upon the death of either the whole of the property goes to the survivor. No will of the decedent would affect this property be cause the survivor had title prior to the will.

Collecting Wages

I did work for a man who gave me two notes which are now a year overdue. He claimed he had his crop and land mortgaged, also his stock and auto. Could I attach the property and get judgment?—Subscriber, San Diego.

In case of attachment on personal property, you would be obliged to put up the amount of prior mortgages. However, you could attach the real estate and sell under execution subject to the mortgage now there.

Contract With Agent

I have a lease on property and a contract written on a separate paper whereby I am given option to buy the property on certain terms. This is signed by the agent who acts for a relative. Is the contract lawful? — Subscriber, Lancaster.

Unless the authority of the agent to make the contract is in writing, executed by the owner, the contract is not binding upon the owner. If it was signed by the owner, even though not acknowledged, it could be acknowledged by the holder of the option, then recorded, and it would effectually cloud the title.

Property of Second Wife

A man purchases ranch on contract. Has children by a first wife. The second wife has put some money into the ranch but has nothing to show for it. What should be done to protect her? Subscriber, Madera.

If the husband should acknowledge in writing the contribution of the wife from her separate funds, in case of his death she would be entitled to make her claim to repayment of the money as against the estate.

Wife's Interest in Estate

A ranch stands in name of wife who operates it. The husband has a half interest in a business which occupies his time. If the husband dies without will, can the wife hold the ranch? What claim has she in the husband's half interest in the business? There are no children.—Subscriber, Los Angeles.

Since the property stands in the wife's name the presumption of law arises that it is her separate property. As such, of course, it would not be subject to administration on the husband's death. As to the half interest which the husband has in other business, upon his death without will one-half interest in his interest would go to the surviving wife and the other one-half to his next of kin.

Distribution of Estate

A man owns a ranch for which he paid a small portion of its present value. He has eight children, marries a second time, and by that marriage has one child. To what share of the property is the wife entitled in case of the husband's death? What share would the respective children receive? In case the second wife had children at the time of her second marriage, would they be entitled to any of the property? — Subscriber, Anaheim.

At the time of the second marriage this was the sole separate property of the husband. Increase in the value of the ranch would be increase in the value of his separate property and would not constitute community property. Therefore the second wife would have no interest in this ranch as community property. In case the husband died without will the property would descend as his separate property; that is to say, the second wife would receive one-third and the remainder in equal shares would descend to the nine children, being the eight children of the first marriage and one child of the second marriage, as the law provides that children of half blood inherit equally with the whole blood. The children of the second wife by a former husband would have no interest in the property.

Home Butchering

Is there any state or federal pure food inspection to interfere with the butchering of my own hogs and selling nams and bacon direct by parcel post?—Subscriber, Dyerville.

There seems to be no state law compelling inspection of meat butchered by farmers. The federal pure food law expressly provides that none of its provisions shall be construed to apply to any cattle, sheep, or swine slaughtered by any farmer upon his farm transported in interstate commerce unless the carcasses come to a packing or canning establishment and are there intended for interstate transportation.

Settling Small Estate

A man dies without will, leaving solely real estate of the value of $500. This has been a number of years since. No administration has been had on the estate. What is necessary for the widow to do in order to acquire or convey property? — Subscriber, Hemet.

In case the estate of the deceas d person does not exceed $1.500 in value and a widow or minor child survives, it may by a verified petition of the administrator appointed in the matter of said estate or the widow or guardian of the children be shown to the court that the estate does not exceed the sum specified and the court thereupon issues an order to show cause

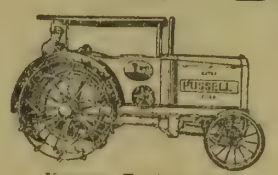
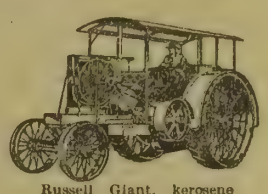
RUSSELL
THE OLD RELIABLE LINE
1842–1921

The "Blue Ribbon" Team



Kerosene Tractors, made in 12-24, 15-30 & 20-35.



Russell Giant, kerosene tractor, 30-60 horsepower.

Made in six sizes from the 20x34 for individual farm use to the big 36x60, all alike in design and good features.

Pedigreed by 80 Years of Development

"My Russell 15-30 tractor pulls 3, 14-in. plows in alfalfa and bluegrass sod and 4, 14-in. plows in stubble from 6 to 9 in. deep, and I use it to run my 24x43 Russell Thresher. The combination can not be beaten".—C. F. MELLENBRUCH, Fairview, Kan.

"I use my 12-24 Russell tractor to pull 3, 14-in. moldboard plows 6 in. deep and in 10 hours I burn 20 gallons kerosene; I run a 30 horsepower dynamo with it night and day, and use it to move houses and barns. It is the most powerful little tractor I ever used, has not cost me one cent for repairs and is "my horses and mules".—F.A.BARROWS, Hooker, Okla.

"My Russell Giant pulls 11, 14-in. plows 6 in. deep in sod and the 20-35 pulls 6 disc plow in low land; and on high gear it pulls 2, 16-hole drills easily. Have used them since 1918; they can't be beat; the cost of repairs is negligible and I now use no horses at all".—D. DAVIDSON, Solomon, Kan.

"Have had our Russell 12-24 tractor since 1917 and use it to pull 3 plows 6 to 8 in. deep, also to run 20x34 Russell Separator and pull 8-ft. tandem disc and clod crusher. Total cost for repairs $75. In 11 hours running it uses 3 gallons gasoline, 20 gallons kerosene and 2 gallons engine oil. It is reliable and dependable".—FENWICK BROS., Waverly, Ky.

RUSSELL TRACTORS---First made in 1875; every feature tried out and proven true in service; built with hand-made quality of workmanship to the Russell Standard of "not how many, but HOW GOOD."

RUSSELL THRESHERS --- With the big, easy-running, 15-bar Cylinder, the High-finger Grate and the distributing beater. No other thresher has these features---and none other can equal the Russell for saving and cleaning ALL THE GRAIN.

Avoid experiment---Get a true and tried Russell--Send now for new catalog--FREE

DURANGO COTTON SEED

From one of our best test fields, resulting from three years' selection, starting with carefully bred California acclimatized seed. We rogue for less spreading type of plant, permitting close planting; for productiveness and for larger bolls which open wider, fluff more and pick easily; also and especially for early maturity and for lint length and strength. We receive premium for uniformity lint length, strength and color. Seed cotton from which these seed selected ginned over 32% More net income per acre growing this type Durango than any other kind or type of cotton known to us. Our seed purchased in carload lots by Cotton Associations. We ship to Arizona, New Mexico and East. Inspected and approved by Government officials, State Entomologists and Quarantine officers. Ask any of them. By the bag, approximately sixty pounds, five cents per pound, f. o. b. Westhaven. Check must accompany order. No more carload lots. Telegraph for ton prices. BOSTON LAND COMPANY, Westhaven, Fresno County, California.

Household Department

TAXPAYER'S ULTIMATUM

Our taxes are now altogether too high,
Much higher than we can afford;
"Cut down the expenses" should be the new cry
Of each official and board.
The state legislators should make it their creed
To veto each appropriation—
Except in the case of the money we need
Down here at Alfalfaville station.

We taxpayers think that a very strong curb
Should be put upon all politicians,
Extravagant spending we fear will disturb
Our unsettled business conditions.
The knife should be used without favor or fear
On every clause in the budget—
But as for the sum we are asking down here,
No statesman, we think, would begrudge it.

We're strong for retrenchment—remembering, though,
The danger of cutting too deeply;
Economy always—provided, you know,
The practice of thrift toward a neighboring town
Will meet with our warm approbation,
But woe to the man who attempts to cut down
The funds for Alfalfaville station!
—Spokane Spokesman Review.

AT THE EDGE OF HILOTOWN

By Clara Peterson

BARON DOLPHUS, who lived in Hilotown, had a little girl named Ellareen. She was forever running away, down the hilly lawn, across the dusty road which was just at the edge of town, and then out into the country or toward the city as fast as her little legs would go.

For several weeks the baron had been intending to go out on the lake road and buy a watch dog for Ellareen, but something had always prevented. For one thing it was very hot weather and the baron was quite too plump to like to travel, especially on his horse's back; he was extremely likely to go slipety slip all of a sudden and have to be boosted up by someone with a great deal of muscle.

There was a rather shaggy old mastiff named Gyp who lived way around the house in Ellareen's back yard. She peeped at him sometimes through the stable fence, and Gyp would walk over so she could pull his hair and laugh. He would have liked nothing better than to watch Ellareen forever and ever, but he was only a tramp dog and, while the baron allowed Ranga, the cook, to toss the dog bones and left-overs, he would never in the world have thought Gyp blue-blooded enough to mind baby Dolphus.

You see, the baron was quite proud and pompous. It was all because he was related by marriage to the Duke of Denheim. There had been quite a stir in the baron's house for some time and Ellareen had run away more than ever, for who was coming to visit, arriving a week from Wednesday, but the Duke himself. The Duke had never seen Hilotown, for it was a tedious journey overland. Baron Dolphus didn't care much what his noble relative thought of the city, but he wanted his own estate to look just right, and he wanted especially to have plenty to eat, for more than almost anything else the two chubby gentlemen liked to sit down to a groaning table.

So everybody had been out cutting grass to make the lawns look smooth and restful, or mending walks or washing windows. Everybody but Ranga, that is. Poor Ranga had seven times as much work as all the rest for he had to feed the household and in between prepare for the Duke. The baron himself had come down to the dark kitchen on Tuesday and handed to the cook a parchment naming the viands which were to be all ready in eight days; 2 roast pigs, 12 goose-liver pies, 7 roast ducks, 45 glasses of currant jelly, 20 glasses of quince jam, 50 loaves of raisin bread, 37 fruit cakes.

And so on, down to the bottom of the page.

The wonderful Wednesday came at last. Everyone in the big rambling house got up early for once; even the two little pages opened their eyes at 6 o'clock instead of 9.

Ranga got up at 4:30, for the pigs and ducks had come from the butcher the night before and were ready to be stuffed and roasted. He was so busy all morning in the fiery kitchen that poor old Gyp didn't get even a crust of bread, but sat out in the shade of a gooseberry bush and tried to wait patiently.

Every time there was a minute to spare Ranga would open the pantry door and peep in, then he would rub his hands together and his fat red face would beam with pride. There were strings of sausages hanging from the ceiling, and crackly joints of beef to be sliced cold, and platters of orange sweetmeats, and great stone jars of bread and cake, with the lower shelves all ready to hold the roasted fowls and the little pigs when they should come from the ovens.

By 12 o'clock the dining-room girl was busy laying the table with the silver plate, and everybody was bobbing around excitedly. The baron himself sat in a great chair on the veranda and his scarlet velvet suit sparkled in the sun. Little Ellareen was playing happily with her corn-cob doll and the baron beamed at her fondly; he thought she looked extremely beautiful and distinguished in her blue and yellow striped dress, but as a matter of fact she was only a roly poly three-year-old with a turned up nose and fuzzy hair the color of the yellow stripes.

"Zounds!" exclaimed the baron suddenly, bouncing up and peering down into the country. "They are coming! I see a flash of purple on the road."

In three or four minutes a horseman in a gleaming white and purple suit emerged from the maple trees. His quivering black horse ascended the path and stopped directly before the veranda, and the messenger, dismounting, bowed very low.

"His Royal Highness, the Duke of Denheim, begs to announce that he will not arrive until 3 or 4 or 5 o'colck. Feeling slightly sleepy in the warm air, His Highness found it necessary to have his couch erected and he is now slumbering thereon."

(Continued next week.)

Is your sink 36 inches high? Most kitchen sinks are so low that they cause endless discomfort and back strain. "Standard" kitchen sinks have adjustable legs, so that they can be set from 32 to 36 inches high, as desired. Measure height of sink from top of rim to floor.

Write today for copy of catalogue "Standard" Plumbing Fixtures for the Farm." It is illustrated in colors, shows many styles of sinks, complete bathrooms and fixtures, model kitchen and laundry.

HINTS FROM HOUSEKEEPERS

India Relish

In the Cultivator of March 19 I noticed query for India Relish. I have one I consider unusually good and am sending it to you:

Two quarts green tomatoes, one quart white onions, one head cauliflower, six green peppers, two red peppers (with seeds removed), one teacup salt, one quart cold water. Chop and let stand in salt water over night, scald all together in morning and let drain.

Dressing—One cup sifted flour, six tablespoons ground mustard, two cups sugar, one tablespoon tumeric. Mix together to make a paste. Scald three quarts vinegar and mix together till it thickens, then cook all ingredients five minutes. When cold add one-half ounce celery seed, one-half ounce mustard seed and can cold.—Mrs. C. G. Wetherille, Fallbrook.

Angel Food—Butterscotch Pie

Following are two good recipes I use often:

Angel Food with Three Eggs—One cup sugar, 1 1/3 cups flour, ½ teaspoon cream of tartar, 3 teaspoons baking powder (slightly rounding), 1/3 teaspoon salt, 2/3 cup scalded milk, 1 teaspoon vanilla or almond. Last fold in carefully beaten whites of three eggs (beaten stiff). Mix and sift first five ingredients five or six times, add milk very slowly while still hot, beating continually; add vanilla; mix well and fold in whites of eggs. Turn into ungreased angel cake tin and bake in very slow oven about 45 minutes. Remove from oven. Turn pan upside down on plate and allow to stand until cold. Cover top and sides with the following:

Icing—1½ cups powdered sugar, 2 tablespoons hot milk, ½ teaspoon butter, ½ teaspoon vanilla or almond. A few drops of food coloring ("raspberry red") makes a very dainty cake. This cake is also very desirable for children's birthday cake as it won't be too rich for children.

Butterscotch Pie — Line a pie tin with pie crust and bake in quick oven while making filling. Place in a saucepan three level tablespoons butter, 1 cup brown sugar. Heat slowly and cook three minutes. Then add 4 level tablespoons corn starch, mix well, add to cooked sugar and stir constantly till thickened smooth, about three minutes. Take from fire and add 2 well beaten yolks of eggs, pour mixture in prepared crust. Six or 8 drops of maple flavor is a good addition to filling. Make frosting of the 2 whites and 2 or 3 tablespoons powdered sugar and brown slightly in hot oven.—Mrs. Ronald Smith, Lindsay.

HOUSEHOLD QUERIES

Puff Paste

Can anyone send me a recipe for cream puffs, just the pastry. I have a good filling. I will give it if anyone wishes to make it. Take thick sweet cream, whip very stiff, add sugar enough to make very sweet. Fill in puffs.—Subscriber, San Joaquin.

To one-fourth cup butter add one-half cup hot water, and when boiling add one-half cup flour and beat vigorously. As soon as the ingredients are well blended remove from the fire and add 2 eggs, unbeaten, one at a time, beating the mixture thoroughly until smooth. Drop by spoonfuls onto a buttered pan, one and a half inches apart, and shape with the handle of the spoon until circular, piling the mixture slightly in the center. Bake 30 minutes in moderate oven. When done remove from the oven and when

The Cultivator Patterns

BE SURE TO SEND SIZE

3527. Ladies' Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 6¼ yards of 44 inch material. The width of the skirt with plaits extended is about 2¾ yards. Price 10 cents.

3550. Girl's School Dress. Cut in four sizes: 6, 8, 10, and 12 years. A 10 year size will require 4⅛ yards of 27 inch material. Price 10 cents.

3187. An "Easy To Make" Apron. Cut in four sizes:, Small, 32-34; medium, 36-38; large, 40-42; and extra large, 44-46 inches bust measure. A medium size will require 5 yards of 36 inch material. Price 10 cents.

3545. A Pretty Negligee. Cut in four sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size will require 3⅝ yards of 44 inch material if cut without center back seams, if cut with seams, 4 yards of 36 inch material will be required. Price 10 cents.

3544-3541. Ladies' Costume. Blouse 3544 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 3½ yards of 27 inch material. Skirt 3541 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. It may be cut with or without a centre front seam. Without the centre front seam a 26 inch size requires 2⅝ yards of 48 inch material; if cut crosswise of the goods, and 2¼ yards if cut lengthwise and of 54 inch material. Cut with centre front and back seam and straight at the front edge it will require 2¼ yards of 54 inch material. With bias edges 2¾ yards will be required. The width of the skirt at the foot is 2⅜ yards. TWO separate patterns, 10 cents FOR EACH pattern.

3092. Girls' Dress. Cut in four sizes: 6, 8, 10 and 12 years. Size 10 requires 3¾ yards of 44 inch material. Price 10 cents.

3537. Ladies' "Work" or Home Dress. Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5⅜ yards of 36 inch material. The width at the foot is about 2¾ yards. Price 10 cents.

3557. Ladies' Coat. Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 2¾ yards of 40 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEKS; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles

cool make slit in side of each puff, large enough to admit the cream filling. If puffs are removed from the oven before they are thoroughly done they will fall. If in doubt, take one from the oven, and if it retains its shape, it is done. This recipe makes nine small puffs.

Cream Filling.—Where one cannot afford thick cream or does not wish so rich a filling, here is a good custard filling: In a double boiler heat 1 cup milk. While heating mix one-half cup sugar, 2½ tablespoons flour, ⅛ teaspoon salt well together, then add to 1 egg slightly beaten. Gradually pour on the heated milk, return to double boiler and cook 15 minutes, stirring constantly until the mixture has thickened. When cool add ½ teaspoon vanilla and put into the puffs.

Canning Pimientos

Will you kindly give me information how to can pimiento peppers?—Subscriber, Placerville.

Use only perfectly sound peppers. To remove seeds cut around stem of each with slender paring knife and remove inside portions. To peel place in hot oven from six to ten minutes until skin blisters and cracks, watching carefully to see that they do not burn. Remove skin with slender paring knife. Flatten peppers and pack in horizontal layers in jars, adding no salt nor water. Put on top, place in water bath (home made canner of wash boiler or kettle). Bring water to boiling point in canner, boil 20 minutes for pints, 30 minutes for quarts. Irregular or broken peppers may be cut in strips or chopped and canned in same way.

An exceedingly valuable publication, Circular 160, "Peppers," has just been issued by the U. S. department of agriculture, containing instructions on planting, canning and preparing peppers for the table. This may be secured free by simple request to Department of Agriculture, Washington, or possibly your county farm adviser has a number for distribution.

Grease Stains

As I have had many valuable helps and hints from your household columns will some one tell me how to remove greasy spots, such as butter on colored silk fabrics, without leaving circles or having to dip the whole garment?—Subscriber, Lindsay.

For removing butter stains on colored silk use French chalk. Lay stained silk on flat surface and rub chalk thoroughly into stained material but gently so as not to pull fibers of cloth. As soon as it becomes gummy shake or brush off lightly and repeat process until bulk of grease is removed. Then apply another thick layer and let stand over night or longer if necessary. This removes all grease and leaves no circle. It is necessary to renew the chalk until every bit of the grease is removed and the chalk comes out dry and white. If not convenient to let stain stand over night, place blotting paper or clean soft cloth over the chalk and apply warm (not hot) iron for several minutes. Sometimes the use of warm iron is necessary in order to melt the solid fat before it can be absorbed by the chalk. If after butter stain is removed the chalk remaining seems to dull the fabric, it may be rubbed and shaken lightly or hung in the wind to blow out or it may even be necessary to wipe out lightly with clean cloth wrung almost dry out of clean warm water, beginning with circular motion outside of the stained area, working carefully into center. Where one wishes to use gasoline, benzine or ether, employ this same method, approaching the stained area with circular motion from the outside unstained part to insure against rings. This presupposes, of course, clean material; if the whole garment has been worn and is slightly soiled the cleaned area is bound to show up against the rest of the garment. French chalk is one of the cleanest and most convenient cleaners to keep on hand. In the form of little cones it is almost instantly applied. If possible rub it on spot while still fresh. The grease will come out very easily. This works best on woolen or silken fabrics, but may even be used on cotton and linen, but it is always necessary to take out the last of the chalk with dampened cloth as described above.

Bring Me A City!

Heeding no barrier of river, mountain, forest or desert; unmindful of distance; the telephone has spread its network of communication to the farthest outposts of our country.

The ranchman, a score of miles from his nearest neighbor, a hundred miles from the nearest town, may sit in the solitude of his prairie home and, at will, order the far-distant city brought to him. And the telephone obeys his command.

Time and space become of small account when, through desire or necessity, you would call across a continent.

This is what the "Long Distance" service of the Bell telephone has accomplished for you; what science in construction has created; and what efficiency of workers has maintained.

You take the telephone as much for granted as you do the wonder of the changing seasons. You accept as a matter of course the company's ability to keep all the parts of this great nation in constant contact.

By so doing you offer a fine tribute to the Bell organization which has created this "Long Distance" service—a service no other country has attempted to equal.

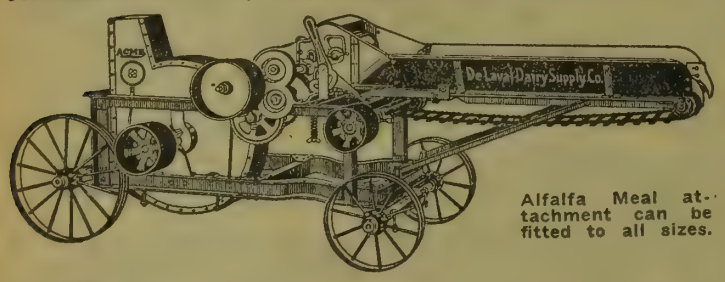
Wherever water is to be lifted

The ACME Cutter

Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine



Alfalfa Meal attachment can be fitted to all sizes.

Save 10% to 30% of Your Feed

The saving of feed by cutting it up with an Acme Cutter has been demonstrated by many Pacific Coast Dairymen to be more than enough to pay for the cutter in one season.

It is the habit of stock, whenever given an abundance of feed, to pick out and eat only the finer and more palatable portions; nosing out and wasting weeds, and foxtail and the stemmy part.

This loss ranges from 10% to 30%, the amount depending upon the quality of the hay and the method of feeding.

Chopped Hay, with careful handling, will keep five cows, while the same weight of loose or bulk hay will only keep four. Waste is eliminated by chopping your hay.

Men who dairy on a business basis find that chopped feed is the surest way to utilize to the fullest extent the feed value of the entire hay crop.

The durable steel framed Acme will earn its cost every season chopping hay and at the same time provide you with a Silo Filler of superior cutting ability and an Alfalfa Meal Machine.

A FEW SPECIAL FEATURES OF ACME CONSTRUCTION

All steel triple frame construction.
Center hung blower fitted with six arm blower fan that will not clog.
Big range of pulley sizes permits change in speed of cutter head and blower to suit length of cut and height of silo. All gears are well guarded.
Soft steel shear pins through fly wheel and pulley prevent accidents to machine or operator. Reverse lever with gears enclosed in housing. No rachet to stick at critical moment.
Immediate deliveries.

CULTURE OF SORGHUMS

(Continued from Page 479.)

may be seen distinctly across the field row, cultivation should commence, and a six shovel cultivator equipped with shields and set to penetrate the ground from four to five inches has been found to be the most desirable type of implement. The later cultivations should be shallower, and more effective work may be done by substituting spear head sweeps for the cultivator teeth. The plants in the row should be thinned when they have reached a height of about three to four inches and the weeds in the rows, inaccessible to the cultivator, may be destroyed at the same time. If a rain occurs subsequent to planting, resulting in a crusted soil, either a light harrow or a corrugated roller may be used to advantage.

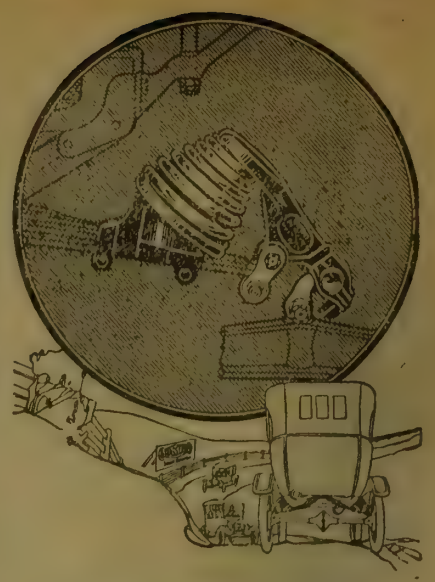
Irrigation

In seasons of abundant winter rainfall, especially on soils of a retentive character, very satisfactory yields of both grain and for ge have been produced without irrigation, but if irrigation is available the yield may always be increased from 30 to 50 per cent by properly timed irrigations. The crop is benefited most by irrigations just prior to and during he ing, and irrigations subsequent to that time have been found to be less effective. Late irrigation often has the effect of stimulating a late vegetative growth and retarding maturity, making it difficult to head and thrash the crop before the rainy season sets in. Irrigations subsequent to heading always have the effect of causing the plant to develop lateral stalks or rattoons which bear late ripening heads and interfere with harvesting operations. In 1919 there was a considerable rainfall in September in the Sacramento Valley which had the effect of delaying maturity of grain sorghum crops and preventing curing prior to harvest. In that year the milo crop at the university farm was a complete failure because it failed to ripen in season to harvest. Late irrigations (after the seed is formed) have produced similar effects.

Harvesting

Of the three methods of harvesting the grain, the system of picking by hand is most common. One man and a wagon can generally harvest one acre a day in this way. The heads are thrown into a wagon as cut and then spread in a thin layer to dry for thrashing. A good plan is to place the heads in a layer about one foot in depth on straw, and thrash when they have dried sufficiently. The heads together with the straw may be fed into the thrashing machine. A grain separator of the ordinary type may be used for this purpose, but in order to avoid the cracking of the kernels about one-half of the concave teeth should be removed and the speed of the cylinder reduced by about one-third. The milo crop at the university farm in 1920 contained slightly too much moisture when thrashed and showed indications of heating in the sacks. We had just finished our run of fruit in the evaporating plant and were able to save the milo crop by spreading it out on the fruit trays and running it through the drying chamber and resacking.

The "row corn binder" is well adapted to harvesting grain sorghums and provides a much cheaper and quicker method. The crop is tied in bundles of convenient size, which are set up in cocks until the grain has been thoroughly dried. The bundles may then be hauled to the thrasher and the seed separated by simply pushing the head end of the bundles into the cylinder, or in case the crop is light the entire bundle may be run through the machine. The third method of harvesting grain sorghums is by means of a header. Crops of uniform height may be headed by the use of the common grain header and the heads dried preparatory to thrashing, as suggested above for the hand method. Non-uniform crops cannot be handled in this way because of the difficulty of adjusting the height of the cutter bar to pick up all of the heads. One row headers which may be attached to a wagon and driven by a sprocket from the rear wheel are now coming into use in the Kafir corn districts of Kansas, Nebraska, Oklahoma and Texas. These ma-



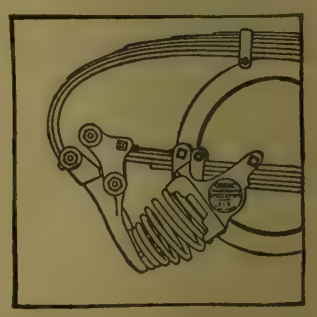
Use them 10 days—

Try "Hasslers" at our risk!

ANY Hassler dealer will put "Hasslers" on your car—let you use them for 10 days — in your own way — and if you're not pleased he'll take them off and refund every cent of your money!

We want you to realize just what it means to save one-third of your tire, upkeep and depreciation costs! We want you to ride in your car and have the same comfort as afforded by high-priced models.

Then we know you'll be one of the fast growing multitude of enthusiastic "Hassler" users. Remember, you can get "Hasslers" for every model of Ford Car, and also the truck. If you don't find a dealer near you write us.



This illustrates the Hassler model now made for the Dodge Brothers Car—giving it perfect luxury and added smartness. Four Hasslers to the set—and they do not change any part of the car. Ask your Dodge Dealer.

chines are very efficient and economical and have not as yet been used in California for the reason that Kafir corn cannot be satisfactorily grown here, and milo and Egyptian corn, because of their non-uniformity and goosenecked characteristics, cannot be handled by machinery of this type. A new type of grain sorghum called Yolo maize has recently been developed at the university farm, which produces well under California conditions, is uniform in height and carries all of its heads in an erect position. It is also dwarf in stature and stands four feet in height at maturity. It is thought that this new variety of grain sorghum will lend itself well to being harvested with one row header. Demonstrations will be made at the university farm this season to determine that point. The expense of harvesting has been the principal objection to the most extensive growing of grain sorghums in this state, and the purpose of the experiment station in developing this new variety has been to give the farmers a grain sorghum which may be harvested at small expense by the use of machinery.

Sweet sorghums grown for silage should be harvested when the seed has hardened; if cut before that time the sweet juice is apt to sour and impair its feeding value. When cutting for fodder the best quality may be secured by cutting earlier, while the kernels are in the milk. At this stage of development there is less fiber in the stalks and less waste in feeding. When placed in a silo, however, sorghums may have almost reached complete maturity and yet make silage of the best quality. Large late maturing varieties of saccharine sorghum, such as Honey, Red Amber and Orange, if planted from April 15 to May 1 should be ready for use early in October and should yield from 20 to 25 tons of green silage per acre on good land with irrigation. Indian corn under similar conditions may be expected to yield from 12 to 18 tons of green silage per acre, and experiments at the university farm have shown that these two crops are nearly equal in feeding value. The grain sorghums such as milo, feterita and Egyptian corn are inferior for silage purposes both from the standpoint of yield and quality. They generally yield from eight to ten tons of green silage per acre and are coarse, pithy and less palatable to livestock.

Sorghums or Sudan grass which is broadcasted or drilled and harvested as a hay crop should be cut in the (blossom) early milk. At this stage of development they will yield the finest quality of hay and will provide a larger second growth than if harvested at a later stage of development.

Book Review

CORN BOOK

"Corn Book for Young Folk," by Charles B. Williams, dean of agriculture, North Carolina college of agriculture, and Daniel H. Hill, ex-president North Carolina state college of agriculture, published by Ginn and Company, 15 Ashburton Place, Boston. $1.20.

California corn fields produce more corn per acre than do the fields in the regular "corn states." However, conditions are not all to the liking of Indian corn or maize and we know of no "corn club" as is common in high schools of the middle eastern corn states and more recently the more southern or formerly known as cotton states. Yet the book has value for corn growers of California. It is put up as a text book, and yet, as all producers should continue to use text books, the form of this publication is not in any way objectionable. The book consists of 19 chapters touching upon the importance of corn crop, with many historical notes and illustrations, climate, races of corn, growing plants, markings of good seed ears, selecting, storing and testing of seed. soils, cultivation, harvesting, storing and a liberal discussion of corn silage. From the preface we quote:

"If a young farmer can be led to acquire skill in growing one crop, he will unquestionably apply the principles that brought success in the one crop to all his other crops. The authors of this book, therefore, think it best not to confuse the mind of a beginner by a discussion of all the standard crops, but rather to teach the general principles of crop growing through their application to a specific crop. The fundamental principles, like seed selection, the preparation of a seed bed, tillage, rotation of crops and control of moisture, are prectically the same for all crops. The essential differences, like methods of planting or harvesting, are easily acquired. Corn was selected because it is almost universally grown in our country."

STEER VS. BEEF PRICES

Despite the fact that the average price paid for good beef steers on the Chicago market from March 5 to 19 declined from $9.95 to $9.70 per hundred pounds, figures compiled by the bureau of markets of the United States department of agriculture show that during the same period the average price of good steer beef at three large Eastern markets advanced from $16.47 to $17.63. Similar compilations show that from March 5 to 19 the average price paid for medium beef steers dropped from $9.20 to $8.93, whereas during the same period the average wholesale price of medium steer beef increased from $15.43 to $16.65.

During the period covered the price of heavy steer hides declined about two cents per pound, which would justify either a decline of 13 cents per hundred pounds on live steers or an advance of approximately 25½ cents per hundred pounds on dressed meat.

Dont Send a Penny

These Work and Outdoor Shoes are such wonderful values that we will gladly send them to you by mail, no money down. You will find them so well-made and such a big money-saving bargain that you will surely keep them. No need to pay higher prices when you can buy direct from us.

Mens and boys Brown Elk Hide Soft Chrome Leather

SCOUT SHOES $2.98

Extremely popular for work out doors and on the ranch. A special purchase allows us to sell them at this remarkable price. We Pay Postage

The best shoe of its kind—we have sold thousands of pairs. These shoes are worn by men who want a light weight, strong work or sport shoe that is soft and durable. They are made of the finest quality genuine chrome tanned elk leather, over a roomy last. Half bellows, dirt excluding tongues, extra heavy flexible Elk soles and strong leather heel. Choice of brown or black color. Just slip them on and see if they are not the most comfortable, most wonderful shoes you ever wore. Pay only $2.98 for shoes on arrival. If, after careful examination, you don't find them all you expect, send them back and we will return your money. PRINT carefully your name and address, and be sure to state size and width you want. Order by No. C 1408. Give size and width.

Send for FREE CATALOG of shoes for Women, Boys, Girls and Children and other Men's styles.

DISPERSAL SALE

60 Registered Holsteins 60

Owned by

R. F. Guerin, Visalia, Cal.

Thursday, April 14, 1921

It will be remembered that Mr. Guerin sold all of his milk cows at public auction in April, 1918, retaining only his young heifers.

The present herd is made up largely of those heifers, every animal in the sale except one being under 4 years old. The sale includes

22 DAUGHTERS OF SIR VEEMAN KORNDYKE PONTIAC, the great 30 lb. son of Sir Veeman Hengerveld. One of his daughters, owned by Earl Graham, Compton, made 759 lbs. butter and 20,270 lbs. milk in one year as a junior 2 year old, and now fresh as a junior 3 year old has made 33.06 lbs. butter from 666.6 lbs. milk in 7 days, milking 115 lbs. in one day.

23 DAUGHTERS OF KING SADIE VALE IDYL SEGIS, who is by a son of King Korndyke Sadie Vale and out of K P Idyl Segis, a 35 lb. 4 year old daughter of King of the Pontiacs. Most of these are out of daughters of Sir Veeman Korndyke Pontiac.

A NUMBER OF THESE HEIFERS are out of high record dams, up to over 31 lbs. butter in 7 days.

A WONDERFUL YOUNG BULL

KING TOLA PONTIAC KORNDYKE, sired by the $12,000.00 bull King Korndyke Pontiac 20th and out of K P Tola, 36.15 lb. daughter of King of the Pontiacs that is now completing a yearly record at Burr Farm that seems certain to exceed 1000 lbs. butter.

KING SADIE VALE IDYL SEGIS

the 35 pound son of King Korndyke Sadie Vale 27th, now heading the herd, and he is only 3 years old, with a lot of good young daughters in this sale.

YOUNG BULLS FOR DAIRYMEN

The sale also includes a number of young bulls, about ready for service that will no doubt go at dairymen's prices.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and individual certificates furnished.

HOLSTEIN-FRIESIAN — CATTLE

Nuevo, Riverside County, Cal.

Registered Holstein Females
FOR SALE

My recent purchases of registered Holstein females have overcrowded my yards and I beg to announce that I must dispose of a number of yearling and two year old heifers, both open and bred to freshen before fall.

These are wonderful individuals, strong in the blood of King Segis, and are a wonderful buy for any breeder who has the room to carry them. I feel you will find them priced to suit you.

They Will Grow Into Money for You

Come out and see them. Correspondence promptly answered.

I want to impress every breeder that every animal I sell is tuberculin tested, guaranteed to be a breeder and I stand squarely back of each individual sold. Breeding Holstein-Friesian Cattle is my sole occupation and every transaction must be satisfactory to the buyer or the transaction is not complete.

Sycamore Acres is located at Nuevo, twenty-two miles Southeast of Riverside and five miles East of Perris. Fine roads all the way.

Holstein Bull Calves For Sale Very Reasonable

Sired by Sir Veeman Korndyke Pontiac and out of yearly record cows. Write for prices, photo and pedigree.

Humboldt County's Dairy Industry

Humboldt County, though not the leading county in the state in the total amount of dairy products produced, is nevertheless probably the foremost county in the dairy industry of the state today. This is true particularly from the standpoint of quality, variety of products produced, and the production per acre; only a very small portion of the county's area being devoted to dairying.

A brief survey of the dairy industry in this county brings to light considerable food for thought on some very interesting points.

The rapid development of the Swiss cheese industry is one of the newest advances made by the county in the dairy manufacturing line and is attracting attention from all parts of the globe. In quality and excellence it is placed on par with the imported variety. This cheese holds the unique distinction of being the only Swiss cheese in the world made from pasteurized milk.

The largest single Swiss cheese factory in the country is also to be found in Humboldt County, and probably the largest Swiss cheese curing room in the world.

The only butter cutting and wrapping machines of the kind in existence are in use in two creameries in Humboldt County, cutting and wrapping quarter pound squares of butter accurately and efficiently.

Practically every dairy product and by-product known is or has been manufactured in Humboldt, some 11 different products in all now being produced.

There are 6,175 cows in the county under test in two cooperating cow testing associations, employing four testers who devote their entire time to this work. Reports submitted by the testers for last year's work show the average production per cow in the associations to be 332 pounds fat.

There are 53,958 acres (estimated), and this contains all marsh and some hill lands, devoted to dairying in Humboldt, and 23,229 (estimated) dairy cows. This 53,958 acres devoted to dairying and 23,229 cows produced for the year ending June 30, 1920, 6,377,517 pounds butter, over 1,000,000 pounds cheese, and enormous amounts of milk sugar, condensed and evaporated milk, skim milk powder, casein, etc., with a total value of all of $7,632,116. the amount received for the finished products by the manufacturer.

Deduction from this would show that approximately 23,000 dairy cows and approximately 54,000 acres of dairy land, coupled with nine modern, up to date, well managed and efficient factories of dairy products brought into Humboldt County last year a total of $7,632,116, a mark in concentrated production of wealth hard to equal.—Hugh G. Asselstine.

Importance of Mineral Mixtures for Swine

It has long been noted that livestock grown in certain sections are outstanding in quality and size of bone development compared to animals produced in other sections, and it is common knowledge that mineral elements in soil and water bear an intimate relation to bone development. Of late, scientists have been giving considerable attention to the mineral requirements of livestock. Quite recently the following article appeared in the Poland China Journal. The authors, John M. Evard and Milton H. Knudson, are regarded highly in the field of animal nutrition. In the hope that our readers may be benefited by their suggestions, we reproduce the article herewith:

There isn't any question that the proper kind of mineral mixtures for swine may be supplied with benefit to swine as well as to the swine owner. The big question nowadays is that of making up the right kind of mixture. In recent years leading investigators in the field of technical and fundamental nutrition, investigators such as Hart, McCollum, Osborne, Mendel, Forbes, Steenbock and others have shown us that the deficiencies in the way of mineral elements are usually covered in our ordinary rations by the addition of calcium, sodium, chlorine and phosphorus. The above elements are supplied in different forms, but usually the calcium is furnished in the form of pure lime, sodium and chlorine in the form of common salt, and phosphorus as bone meal (which also carries calcium), or as di- and tricalcium phosphates, precipitated by-products usually from gelatin manufacture. In ordinary practice it would seem that straight bone meal and salt should carry all of these necessary elements. Some of these experimentalists have shown clearly that the rations otherwise inadequate were made entirely apparently adequate by the addition of pure lime (calcium carbonate) and salt additions to a ration that was otherwise complete with the exception of its inadequacy in minerals.

Of course, this does not mean that other elements are not essential to the organism, but it does indicate that the other elements are usually carried in the ordinary grain rations and hence do not need to be supplied. However, there is considerable question in regard to these matters and common practice would seem to indicate that a more liberal allowance of the various elements would be most acceptable under the circumstances in that the results secured therefrom are better from the standpoint of economical meat production.

Then, too, it has not been demonstrated as yet that the mere addition of the more common elements, such as calcium, sodium, chlorine and phosphorus, is sufficient for optimum nutrition. In other words, there is considerable fragmentary evidence which indicates that other elements may be supplied with profit because of their stimulating and general nutritional virtues. At any rate, more complete mixtures seem to fill the bill better than those composed of only a few elements, and hence it may be advisable in practice to supply a mixture which provides not only the main elements but also others, including not only the mineral elements themselves but materials that have been for countless decades used in swine husbandry, minerals such as charcoal, for instance.

Specifically speaking, the animals must get all of the following organic elements if they would live and thrive: nitrogen, carbon, oxygen, hydrogen (these four are carried by the major organic portions of the ration, as in the proteins, carbohydrates and fats); the main mineral elements are calcium, phosphorus, potassium, sulphur, sodium, chlorine, magnesium, iron, iodine, fluorine, silicon, manganese and aluminum. These elements exist in combination with each other and are termed "salts." They are named in order of the quantities present in the body, there being more calcium than any of the others, with phosphorus running second in amount. It has only been recently that we have appreciated the iodine requirements, the absence of which element in the brood sow's ration, for instance, is at least one of the causes of hairless pigs. Fluorine is found in small amounts but is considered as essential. Silicon is always present but there is some question about its indispensability. Manganese and aluminum may be normal constituents of the animal body and hence we suppose that they may be necessary in the ration, although that is problematic. Arsenic and copper are found in some lower forms of organism and sometimes have been noted in higher forms in very small amounts, but generally speaking they are not considered as essential, and yet considerable mystery still surrounds them.

It is worthy of mention that some of our mineral compounds offered to swine men contain these two ingredients, the arsenic being present in these mixtures usually as arsenic trioxide and the copper in the common form of copper sulphate. If these elements are indispensable for the lower forms it might be that they would perform a useful function in higher forms, even though not found in the body itself. One can analyze a water

wheel or a turbine and not find much water, but water is nevertheless indispensable in making these work. We have known for a good many years that arsenic when fed to animals produced a sleek coat and furthermore tends to enliven extraordinarily. Horsemen have taken advantage of this and so have swinemen. Arsenic fed to rats in very small amounts produces a very velvety and lustrous coat covering, it being outstanding because of this specific development.

Chemists have been handicapped to date by the lack of proper technical methods for the determination of many elements, and hence it is entirely possible that some of these elements present in minute amounts have been missed or overlooked, that is, slipped by undetected. Hence it can be readily seen that the whole matter of mineral nutrition with swine is a complex one and that from the standpoint of practice there is much to be learned, and hence the reason that we of the Iowa station are devoting considerable time to the investigations covering this phase of proper nutrition.

We are suggesting some mixtures which have been used with the idea of putting something definite and tangible before our people. These mixtures are well compounded and represent an application of our knowledge to date. Later we will have more to offer, but for the present we suggest the mixtures described below:

Simple Mixture. Equal parts by weight of lime and salt, or of wood ashes and salt. Primarily the first named carries calcium, sodium and chlorine, but no phosphorus or other elements excepting small traces as they accidentally occur. The second mixture, of course, carries the same as the first, but there is added to it some potassium carbonate and other elements as carried in wood ashes.

A Simple but More Complete Mixture. Equal parts by weight of lime, salt and bone meal. Bone black may be substituted for bone meal and it has the added advantage of carrying animal charcoal. Bone flour is a special by-product from the packing houses and is usually available if bone meal is wished. A mixture of di- and tri-calcium phosphates, a by-product of gelatine manufacture, may be used to replace the bone meal.

A Fairly Complete Mixture. This mixture carries most of the essential elements. Salt, common, flake form, 30 pounds; bone meal, finely ground, or bone flour, 25 pounds; commercial kainit, or potassium chloride, 12 pounds; sulphur, flowers of, 10 pounds; limestone, finely ground or air slacked lime, 10 pounds; glauber salts or sodium sulphate, 5.7 pounds; epsom salts, or magnesium sulphate, 5 pounds; copperas, or iron sulphate, 2 pounds; potassium iodine, .3 pounds; total, 100 pounds.

In order to encourage the consumption of the above mineral mixtures when self fed free choice style, it is a good plan to mix them with a 60 per cent protein meat meal tankage, from 5 to 60 pounds of tankage to the 100 pounds of the above mineral mixtures, regulating the consumption by the amount of tankage mixed with the mixture. Generally speaking, we would advise that approximately one pound of mineral mixture per hog per month be fed. In other words, if one has 100 pigs they should eat 100 pounds of the mineral mixture per month, this in addition to the tankage mixed with it, which is at the rate of approximately one-fourth pound per pig per week. If the pigs do not consume this much, add a little more tankage, then allow the mixture free choice style as before. One can also mix these minerals with the ordinary feeds, in which case we would suggest that the mineral itself be not mixed with every feed, but just one feed per day, the amount allowed being approximately about one pound per pig per month. Allow the mixtures free choice style for the best results.

The animal husbandry section of the Iowa experiment station has found that mineral nutrition problems are rather difficult to interpret experimentally, but we are proceeding to the collection of data which in the long run we feel will be of practical importance to the swine industry, particularly in that we are hoping to apply a good deal of fundamental information that we now have access to through recent discoveries.

For the Prevention of

ANTHRAX

Of all livestock diseases, anthrax is one of the most fatal.
For the preventive and curative treatment of anthrax we offer

ANTHRAXOIDS
(Spore Vaccine)

For immunizing cattle, horses, sheep and mules.

Anthraxoids are Anthrax Spore Vaccine in pill form. Each Anthraxoid is a dose ready to be injected under the skin of the animal.

Antianthrax Serum

A serum to be used when animals show symptoms of anthrax.

Anthraxoids-Antianthrax Serum
(Simultaneous Treatment)

Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.

Special discount on Silos
early buyers get the benefit

Here is a chance to save money on the famous Indiana Silo. On all orders received before June 1st we will allow a special early buyer's discount, in addition to our regular cash discount.

No Delivery Delays Now

Every fall our factory is swamped with belated orders. And every fall some of our customers are disappointed. Car shortages, alone, prevent many late buyers from getting their silo in time to put up the crop. Delayed orders must always give way in the factory to the early ones. For the good of your business and ours we want to make prompt deliveries.

Right now is the time to order. You will have your silo built and ready long before the rush season. And to make it worth your while to order now, we offer a special discount.

An Indiana Silo agent is probably near you. Write to us for his name and full information.

Indiana Silos are Proven

Twenty thousand Indiana Silos on the Pacific Coast prove their success. Manufactured of No. 1 Fir staves. Air-tight tongue and groove joints. Patented door frame made up at factory. Compression cam lock doors. No hinges. Roof supplied with door section finished. Three men can erect an Indiana in three days. No carpenter needed. Money-back guarantee.

See our agent or send the coupon for full informatoin about discounts.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins
April 14, R. F. Guerin, Tulare.
April 21-22, Santa Anita Rancho.
April 20-21, Toyon Farm Association, Los Altos.
April 26, Santa Anita Rancho, Santa Anita.
May 11, Victory Herd, Carruthers.

W. M. Caruthers of Live Oak reports the sale of a young Shorthorn bull to William Day of San Francisco. The calf is said to be a very promising son of Hallwood Villager.

John A. Bunting, secretary of the Pacific Coast Hereford Breeders' Association, has recently selected three Hereford bulls from the W. J. Bemmerly herd, Woodland, and one from the H. H. Gable herd, Esparto, for shipment to Mexico. Bunting believes that during the next few years that the Hereford breeders of this state will be favored with a great deal of Mexican trade.

The Pacheco Cattle Company, Hollister, has sold 23 head of unregistered Shorthorn females and a registered bull to Mr. Mathews of Stockton.

In the second annual Brentwood sale of Holsteins held at Philadelphia, March 29-31, 166 head of bulls and females were sold for a total of $212,635, an average of $1,280. The top of the sale was $27,100 at which price the three year old bull Pietertje Prospect Colantha, son of the world's record cow, Segis Pietertje Prospect, changed hands. This bull was bred and sold by the Carnation Stock Farms, Seattle. He was sired by Dutchland Governor Sir Colantha. Only one California herd was represented in the sale. The Bridgford Holstein Company of Patterson consigned, Prilly Adirondac Dairy Maid, the yearling daughter of Adirondac Wietske Dairy Maid, who holds the fourth highest milk rerord of the breed. The sire of the heifer is King Segis Alcartra Prilly, the popular Bridgford herd sire. The heifer sold for $4,500 which was the second highest price paid for a female at Brentwood.

California Holstein breeders who own daughters of Dutchland Governor Sir Colantha, sire of the $27,100 bull in the recent Brentwood sale, have reason to congratulate themselves. H. H. Sisson of Willets owns Cantata Domino Sir Skylark 3d; the Bridgford Holstein Company of Patterson owns Gerben Colantha Parthenea and T. J. Gist and Son of Tulare, own Carnation Segis Colantha. Messrs. Gist are developing a bull from their daughter of Dutchland Governor Sir Colantha that is sired by Carnation King Sylvia.

Edward Cebrian, manager of the Caledonia herd of Shorthorns, has announced a draft sale to be held at the farms near West Sacramento, May 26. The sale will consist of around 40 females and ten bulls and will include a goodly number of Scotch cattle. It is stated that practically all the females will carry the services of Imp. Caledonia, Gainford Matchless or Pine Grove King. The sale will be managed by C. L. Hughes of the California Breeders' Sales and Pedigree Company.

G. F. Lee, Oroville, recently purchased a young Berkshire boar and two sows from the Jas. Mills Orchard Company, Hamilton City. The sows were bred to Penrith Lustre, a son of Penrith Champion, the 1917 grand champion ov r the entire Northwest circuit of livestock shows.

FERNDALE COW TEST

The Ferndale Cow Testing Association has completed the annual test and filed its annual report. The test commenced March 1, 1920, and ended February 28 this year.

The association started with 126 members, ranging from two cows to 150. The total number of cows signed up was 4,546.

Twenty herds, or members comprising 532 cows, did not finish the year, having either sold their dairies or discontinued testing. 4,014 cows finished their records with an average lactation period of about nine and one-half months, averaging 334.03 pounds butterfat per cow.

Seventeen herds averaged from 400 to 495.76 pounds fat per cow. Nineteen herds averaged from 350 to 400 pounds. Thirty-eight herds averaged from 300 to 350 pounds. Twenty-three herds averaged from 250 to 300 pounds. Six herds averaged from 213 to 250 pounds. This last class was composed of all new members, having tested for their first year.

The highest herd belongs to Nate Hauck, with 18 cows averaging 495.76 pounds per cow.

Peugh Brothers, Elk River, two cows, averaged 493.26 pounds per cow.

Chris Diedricksen, eight cows, 479.80 pounds per cow.

Willsie Elliott, six cows, 464.37 pounds per cow.

Rasmus Martin, two cows, 432.70 pounds per cow.

John Enos, 20 cows, 430.90 pounds per cow.

Chris Lorenzen, ten cows, 428.70 pounds per cow.

J. W. Coppini, 13 cows, 426.20 pounds per cow.

Giles Briggs, 14 cows, 425.90 pounds per cow.

S. B. Morrison, 22 cows, 421.90 pounds per cow.

Wilbur West, 12 cows, 421.70 pounds per cow.

Antone Enos, five cows, 419.80 pounds per cow.

J. A. Genzoli, 42 cows, 419.77 pounds per cow.

Frank Early, 413.20 pounds per cow.

Peter Iversen, 16 cows, 403 pounds per cow.

Jesse Petersen, 41 cows, 400.30 pounds per cow.

L. J. Lindrum, 43 cows, 400.30 pounds per cow.

The highest cow belonged to Nate Hauck, "Speck," which produced 728.95 pounds fat. Seventeen cows produced 728.95 pounds fat; 17 cows produced over 600 pounds fat; 98 cows produced over 500 pounds; 628 cows produced over 400 pounds; 1,541 cows produced over 300 pounds.

The association has now started on its thirteenth year of successful operation. The directors are Harry Harbers, president; J. A. Genzoli, vice president; L. J. Lindrum, G. E. Trigg, William Dauphiny, Bert Gries, Hite Robinson, Antone Enos and J. W. Coppini, secretary and manager.

THE RICHEST POOR FARM

(Continued from Page 487.)

with marked results, and a wonderful lot of heifers has been obtained.

Under the superintendence of W. R. Harriman a number of fine pure breds have been obtained from the Southern California and Arizona breeders and at the recent Guaranty Sale. Also two fine young bulls have been added.

One is Duke Uneeda Banostine from the Reno herd at Phoenix. He is by Duke Banostine Butterboy, a half brother to the great Duchess Skylark Ormsby, and is out of Uneeda Biscuit, who has a record of 27.94 pounds of butter in seven days and is the dam of three A. R. O. daughters.

The other is King Korndyke Pontiac Mead. In this bull the ideal line breeding is observed. He is by King Korndyke Pontiac 20th, the $12,000 Burr Farm bull, who was mated to his grandam, De Kol of Valley Mead 2d, one of the greatest cows in the West, who has a record of 27.01 pounds of butter in seven days and 1,011.71 pounds for the year. The dam of his sire, who is also the daughter of his dam — this is Irish — is Miss Valley Mead De Kol Walker, with the wonderful three year old record of 1,113.57. He was purchased from Morris & Sons of Woodland and combines the great blood lines of the Morris breeding.

(Continued on Page 503.)

"NICKS" THAT ARE PROVEN

It is not a boast, but a matter of fact, that no other herd in the world contains as many proven high record families of long distance producers as can be found in this herd.

Beyond that important fact is one that is even more important—these great families have very fortunately proven to "nick" especially well with each other, and their successful blending has already been abundantly proven not only in our own herd but in many other leading herds where bulls of these "nicks" have been used.

SEGIS PONTIAC ABBEKERK

Sire: SEGIS PONTIAC DE KOL BURKE, son of the former world's record cow Riverside Sadie De Kol Burke, 1085.12 lbs. butter from 28826.4 lbs. milk in one year. He is transmitting unusual production to his daughters and through his sons. He is sire of Miss Aaggie Acme Burke, 1034.66 lbs. butter from 24338.8 lbs. milk in one year as a first calf junior 2 year old, world's milk record in class when made, 35.38 lbs. butter from 726.4 lbs. milk in 7 days as a junior 4 year old, and she is the dam of the $41,000.00 bull King Korndyke Pontiac Acme. Another of his daughters made 932.43 lbs. butter in one year as a senior 2 year old, her son selling for $11,000.00 as a yearling. One of his daughters also sold for $11,200.00 as a yearling.
Dam: CHANGELING TIDY ABBEKERK GEM, 35.05 lbs. butter from 639 lbs. milk in 7 days at 6 yrs., 34.74 lbs. butter in 7 days at 5 yrs., 767.36 lbs. butter from 19,389.9 lbs. milk in one year at 4½ yrs. She was one of the greatest producers in our herd and her 4 year old yearly record is no index to her real production as a mature cow, when we were unfortunately not able to test her for a year. She is by the century sire Changeling Butter Boy and out of a 31.70 lb. daughter of the century sire Tidy Abbekerk Prince.
The three nearest dams of SEGIS PONTIAC ABBEKERK each milked from 607.6 to 920.8 lbs. in 7 days. His three nearest dams average

Butter 7 days	33.01
Milk	722.50
Butter 30 days	130.91
Milk	2947.70

His full brother heads the largest herd in South America, and all of his half brothers that have daughters in milk are transmitting the very large production of their ancestors. We have every confidence that the daughters of this bull will prove great producers, and this confidence is made stronger by the promise of his heifers, some of which are now at breeding age.
SEGIS PONTIAC ABBEKERK heads the high class herd of high record and highly bred females owned by

R. L. HOLMES
MODESTO, CAL.

Because of this proven successful combination of the blood of such great females as De Kol of Valley Mead, Aralia De Kol, Aaggie Acme of Riverside, Riverside Sadie De Kol Burke, and Miss Valley Mead De Kol Walker, breeders who have used at the head of their herds bulls bred in one of these lines or combinations can come back to this herd at any time and find another bull whose blood has already been proven to "nick" with the blood already in their herds.

Thus may be carried on successful line breeding, without the dangers of too close inbreeding, and the fact that we are producing and selling such bulls removes the breeder from the danger of the other extreme, a violent outcross.

We have sold outstanding bulls for prices ranging from $5000.00 to $50,000.00, prices well within the value of some of the exceptional matings we have been able to make, but our main effort always has been and always will be to produce dependable bulls of high yearly record backing and sell them at prices the average breeder and dairyman can pay and gain large profits by their use.

Our prices for such bulls have always been considered very conservative. Ask your neighbor who owns one.

Strong demand keeps our bulls of service age sold out practically all of the time, and if you want to put one of our profit makers at the head of your herd it is best to write us or visit our herd well in advance of the time you will need him.

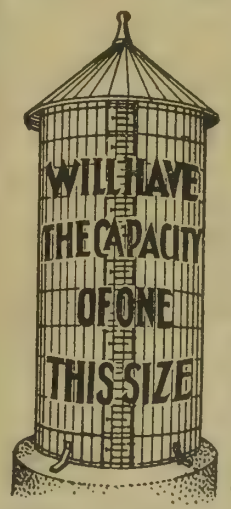
Mission San Jose Cal.

DIAMOND G HEREFORDS
A few choice young bulls, big, heavy-boned husky fellows sired by DON PERFECT 2nd, one of the best sires in the West. Priced right and guaranteed.
H. H. Gable Esparto, Cal.

The Cushman Silage Packer
is a Roller set in a suitable frame on which is mounted the standard Cushman engine—4 H.P. size.

One man in the silo handles the distributing spout and controls the engine.

This lessens the number of men required and packs the silage evenly, eliminating all gas pockets. It will increase capacity of your present silo at least one-third more.



Those who have used them claim that they pay for themselves in a season.

This is no experiment. The engine may be used for other work on the farm also.

The famous 4 H. P. engine used is the one so popular for use on grain and corn binders, manure spreaders, potato diggers. It can be used for pumping, wood sawing, spraying, grinding, making electric lights. It cannot be equalled for power in the blacksmith or machine shop.

Ask your dealer, or write for information to
Cushman Motor Works, Stockton

Plant Winter Rhubarb and BERRIES for PROFIT
We can supply plants—all sorts for large fields. Plant also peaches, plums, prunes, pears, figs, apples, apricots, asparagus, artichokes, etc., for your own table and pleasure. We have a good assortment of fruits of all sorts. Write for price list. J. B. WAGNER, Rhubarb and Berry Specialist, Pasadena, Cal.

To Stop Loss of Milk, Keep It Cold

MILK of ordinary quality held at 75 degrees Fahrenheit, a temperature not uncommon in the summer months, soured in 36 hours, while the same quality of milk held at 55 degrees kept sweet for 80 hours, and at 40 degrees for 180 hours. These results were obtained in an experiment carried on by the dairy division, United States department of agriculture, to determine the effect of temperature on milk, and the results explain in a large measure why milk which has not been cooled on the farm—and kept cold—often is sour when it arrives at its destination.

In one section a survey held during the summer months to determine the temperature at which milk is received at railroad stations for shipment to market showed the average temperature of morning's milk to be about 60 degrees, and in some cases it was as high as 80. These temperatures are much too high to permit milk to be shipped a considerable distance without souring, specialists say. It was found that some mornings milk was rushed from the farm to the station insufficiently cooled. Milk produced the evening before showed an average temperature about five degrees lower than that of morning's milk, and in some instances was as low as 40. A large part of the annual loss from sour milk is due to shipping milk at too high a temperature.

The best and qpickest way to cool milk to 50 degrees, according to department specialists, is over a surface cooler. Use the coldest water available and then set the cans of milk in a well insulated tank filled with water below 40. A ten gallon can of milk precooled with water at 55 and set in a tank of ice water at 37 was cooled to 50 in 20 minutes.

The use of a surface cooler is especially necessary when the time between milking and shipping is short. If warm milk is run over a surface cooler and then set in a tank of water cooled with ice to 40 or below, it should not be difficult to cool milk to 50 within an hour after it leaves the cow. Because precooling with a surface cooler is not practiced and ice is not put into the cooling tank before the milk, much milk reaches the shipping station in summer at so high a temperature that it sours on the way to the city.

On many farms the water used for cooling milk comes from the general storage tank or from a spring. The temperature of such water when it reaches the cooling tank is much higher than when it leaves the well or spring. Well or spring water that has a temperature of from 50 to 55 degrees Fahrenheit frequently is warmed up to 70 or 75 before it reaches the cooling tank. Under such conditions more ice and a longer time are necessary for cooling.

When milk is not precooled and ice is not added to the tank until after the milk is placed in it, with the water supply at 70, 60, 55 or 50 degrees Fahrenheit the time needed to cool ten gallons of milk to 50 is, for these temperatures, respectively, about two hours and 25 minutes, one hour and 45 minutes, one hour and 30 minutes, and one hour and 20 minutes. The time required to cool milk to 50 degrees Fahrenheit by such methods is too long, especially when morning's milk must be delivered at the railroad station within a short time after milking.

The effect of not putting ice into the cooling tank until after the milk is placed there is strikingly shown by tests. When ten-gallon lots of milk, after being precooled with water at 70, 60, 55 and 50 degrees Fahrenheit, were placed in water at the same respective temperatures and ice was added to the tank, it required two hours and 10 minutes, one hour and 15 minutes, 43 minutes and 20 minutes, respectively, to cool the lots to 50 degrees Fahrenheit. The precooling of a ten-gallon can of milk with a surface cooler, using water at 70, saved approximately 11 pounds of ice. With water at 60, 16 pounds of ice were saved; with water at 55, 19 pounds of ice were saved; and with water at 50, 22 pounds of ice were saved.

In order to keep sweet, milk should be protected at all times from high temperatures. A large percentage of the milk supply for cities is delivered at the railroad station by producers, although some is hauled direct to the city. Even under the best conditions, milk that is transported during hot weather is usually several degrees warmer by the time it has reached the railroad station. On the railroad it is held from a few hours to all day, and unless shipped in cars especially equipped to maintain low temperatures there is a further rise in temperature. That is the case when milk is shipped in baggage cars or in milk cars not provided with ice. To make sure that milk reaches the city consumer in the very best condition it should not only be promptly cooled to 50 degrees Fahrenheit or below on the farm, but also should be protected during shipment, the specialists say.

To illustrate the importance of protecting milk in transit during hot weather, four ten-gallon cans of milk cooled to 44 degrees Fahrenheit were hauled a distance of 13 miles from a farm to the railroad station. Can No. 1 was an insulated type, No. 2 was an ordinary can covered with a one inch felt jacket, No. 3 was covered with a half inch felt jacket, and No. 4 was an ordinary unprotected can. During the trip, with the air temperature at 80, the milk in the insulated can rose one degree in temperature, the milk in the cans protected with jackets rose six degrees, and the milk in the unprotected can rose 20 degrees. The cans were then shipped by rail in an ordinary baggage car for more than 1,000 miles at an average air temperature of about 80, in order to study the effect on the milk. In the unprotected can the milk had reached a temperature of 60 in two hours, or after it had traveled about ten miles from the farm (before reaching the railroad); the milk in the can covered with the half-inch jacket reached 60 only after 11¼ hours, or about 268 miles of travel; the can covered with the one-inch jacket traveled for 13 hours, or about 332 miles, before reaching 60; and the milk in the insulated can did not reach 60 until after 25 hours, or 650 miles of travel. By the use of a half-inch jacket it was possible to ship an individual can of milk 26 times as far as in the ordinary can before the temperature rose to 60. The one-inch jacket increased the distance to 33 times and the insulated can to 65 times that of the ordinary can.

Milk sours very rapidly at temperatures above 60 degrees Fahrenheit, and therefore should be kept below that temperature, and preferably below 50, until used.

Dispersal of the Great Toyon Herd

135 REGISTERED HOLSTEINS 135

110 FEMALES 25 BULLS

Toyon Farm, Los Altos, Cal. April 20-21, 1921

Founded upon animals of the most approved breeding, at the large investment that such animals command, the famous herd at Toyon Farm was developed under careful management and has produced a number of world's record producers in the yearly division.

It will be remembered that in November, 1920, about 100 cows were sold out of this herd at Sacramento, and that Toyon Farm has been represented in all of the Guaranty Sales in California, as well as the National Sale at St. Paul. In the latter sale they sold one of the $10,000.00 females in that sale. In this offering the bulk of the cattle, both male and female, are young animals out of the great cows sold out of the herd, and sired by outstanding bulls, and include daughters of

Sir Korndyke Ormsby Piebe

who is out of Queen Piebe Ormsby Mercedes, a daughter of Sir Pietertje Ormsby Mercedes, with 1136.01 lbs. butter in one year, 4913.39 lbs. butter in 5 years, highest in world for age. All of these heifers are out of half sisters to Cascade Fleta Johanna, the great heifer that made over 30,000 lbs. milk in one year as a 4 year old.

Sir Aaggie Mead

who is by Sir Aaggie De Kol Acme, and out of Aralia De Kol Mead with a strictly official record of 1215 lbs. butter in one year, she by King Mead of Riverside and out of the 1142 lb. cow Aralia De Kol, the first cow to make over 28,000 lbs. milk in one year.

Sir Pietertje Ormsby Mercedes 43d

a son of Sir Pietertje Ormsby Mercedes, out of Aaggie Wayne Peep, 1250.35 lbs. butter in one year, 4992.03 lbs. butter in 5 years, second highest in world.

Sir Pietertje Ormsby Canary

also by Sir Pietertje Ormsby Mercedes, and out of an 864 lb. yearly record 3 year old daughter of a 1009 lb. cow.

Sir Bessie Fobes Tritomia

a son of Fobes Tritomia Mutual De Kol and the famous three times 33 pound cow Jessie Fobes Bessie Homestead, who topped the Detroit National Sale.

Mutual Fobes Longfield De Kol

proven 30 pound son of Fobes Tritomia Mutual De Kol.

Chimacum Spring Farm King Pontiac

whose daughters are making splendid yearly records as 2 year olds.

Dutchland Colantha Emperor

a 30 pound son of the famous Colantha Johanna Lad.

Johanna Bonheur Champion

a proven son of Colantha Johanna Champion and the great show and producing cow Johanna Bonheur.

Other Sires of Great Merit

such as Sir Ormsby Burke Segis, King Korndyke Pontiac 20th, Korndyke Queen De Kol's Prince, Sir Johanna Ruth Fayne, and North Star Happy Bonheur.

The Dams of These Females

sired by such bulls as those listed above a large number of the females in this sale are out of dams with both short and long time records, ranging up to over 1000 lbs. butter in one year, over 30,000 lbs. milk in one year, and over 30 lbs. butter in 7 days.

Bred to Outstanding Bulls

added to their great pedigrees, good type, and good health, is the valuable services carried by the large number of cows and heifers now in calf. Most of these are bred to Sir Pietertje Ormsby Canary, Sir Pietertje Ormsby Mercedes 43d, or Sir Aaggie Mead.

An Unusually Attractive List of Bulls

A SON OF SIR PIETERTJE ORMSBY CANARY, out of a daughter of Sir Pietertje Ormsby Mercedes. A rare opportunity to buy a choice young individual intensely bred in the blood of this great sire.

A SON OF SIR PIETERTJE ORMSBY CANARY, out of a 1008 lb. yearly record daughter of Sir Ormsby Burke Segis, second dam a 795 lb. yearly record granddaughter of Paul Clyde.

A SON OF SIR PIETERTJE ORMSBY MERCEDES 43d, out of a granddaughter of Sir Johanna Ruth Fayne with 782 lbs. butter in 313 days.

A SON OF SIR PIETERTJE ORMSBY MERCEDES 43d out of a heifer with 570.27 lbs. butter in 295 days as a junior 2 year old, second dam a 30 lb. granddaughter of Colantha Johanna Lad with 1129 lbs. butter in one year.

SONS OF SIR AAGGIE MEAD, out of dams with most substantial breeding and records.

SONS OF SIR BESSIE FOBES TRITOMIA, out of richly bred dams, many with good records.

This is the Only Herd in California Under Federal Supervision

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested by a Federal veterinarian and sold subject to retest by the buyer.

TOYON FARM is about 20 miles Northwest of San Jose, about 8 miles southeast of Palo Alto.

HEADQUARTERS OF SALE will be Hotel Montgomery, San Jose, and you should make reservation early as this hotel is usually full.

VALUE OF BARLEY FOR SWINE FEEDING

The Wisconsin experiment station has carried on extensive feeding tests with barley and has the following to say concerning its value as a hog feed:

"The fact is that good quality barley so closely approaches corn in feeding value, pound for pound, for swine is of tremendous importance to farmers. Not only is the feeding value higher than that of oats, especially for fattening animals, but barley also produces on the average 19 per cent more pounds of grain an acre than does oats. Many farmers would profit by growing barley on some of the land that they now devote to oats."

"The Badger authorities maintain that it pays to grind barley for swine rather than soak it. Their experiments proved that soaked whole barley was worth only 60 cents a bushel for feed compared with a value of 89 cents for the ground barley. The ground barley is also especially well adapted for self feeding, as it is palatable and the pigs thrive on it.

"As is well known, barley is considerably richer in protein than is corn, hence less protein-rich supplement is required to balance the ration. Ground barley and tankage mixed form an ideal self feeder ration. The Wisconsin people say that their experience has led them to conclude that the following proportions

are about right to use in a mixture of ground barley and tankage for pigs of various ages:

"For pigs weighing up to 50 pounds, 11 to 14 per cent tankage, the rest ground barley; 50 to 75 pounds, 8 to 11 per cent tankage; 75 to 100 pounds, 6 to 8 per cent tankage; 100 to 150 pounds, 4 to 6 per cent tankage; 150 to 200 pounds, 3 to 4 per cent tankage; 200 to 250 pounds, 2 to 3 per cent tankage."

ROSE OF THE RANCHO

Rose of the Rancho 100798, Guernsey cow owned by the Brant Rancho, Owensmouth, has recently completed a record that placed her seventh in class F of the Advanced Register. She began her record at the age of two and one-half years and her year's work amounted to 14,731.2 pounds of milk and 707.27 pounds of butter fat.

This is the second daughter of the Brant Rancho herd sire, Newgrove King of Briarbank 27362, to qualify for the Advanced Register. The first was Elsie of the Rancho 89755, that held tenth place in class DD. Newgrove King of Briarbank 27362, therefore, enters the Advanced Register with two Class Leader daughters.

Newgrove King of Briarbank 27362 was a first prize winner wherever shown for the Brant Rancho, and his sire and dam were grand champions at the Michigan State Fair and winners at the National Dairy Show in 1911. His dam Imp. Newgrove Queen 23647, is one of the best daughters of Imp. Masher's Sequel 11462, with 639.33 pounds of butter fat.

Another California High Producer.
Rose of the Rancho, property of Brant Rancho, and her milker, Lester Kearney.

The dams of both Elsie of the Rancho 89755 and Rose of the Rancho 100798 are in the Advanced Register. Elsie of the Rancho 89755 exceeded the record of her dam by 71.09 pounds of butter fat and Rose of the Rancho 100798 exceeded her dam by 389.89 pounds of butter fat, an average increase of 68.9 per cent.

Rose of the Rancho 100798 ranks third among all two year old Guernseys in milk production, being exceeded by Nugget's Primrose 48835 and Katherine's Trixie 100396. She was a persistent milker, giving over 1,000 pounds during each of her 12 months. Her maximum was in January, her second month, when she produced 1,025.6 pounds. On the last day of her test she produced 33.6 pounds of milk, testing 5.78 per cent. Her butter fat production for full months varied from 51 pounds in August to 68.45 pounds in March.

PURE BRED FEMALE STOCK

According to figures announced by the United States department of agriculture, livestock owners in the United States show a tendency toward pure bred female animals as well as toward pure bred sires. In fact, the use of well bred sires appears to increase the use of good females. During the period October 1, 1919, to March 31, 1920, the quality of female stock kept in herds and flocks headed by pure bred sires was 48.3 per cent pure bred and 2.5 per cent scrub. The remaining number were grades or crossbreds Later figures covering the period October 1, 1919, to December 31, 1920, show that the number of pure bred females kept under corresponding conditions had increased to 55.9 per cent and scrubs had fallen to 2.1.

These figures are based on a knowledge of the breeding of nearly 400,000 head of animals and poultry. In the opinion of department livestock specialists the more general use of pure breds of both sexes on farms in the United States is increasing. In about a year, it appears, the increase in the use of pure bred females by pure bred sire users has been at least 7 per cent.

A Water Users Association has been formed in the Florence Valley of Arizona and officers are to be elected today (April 9). Members are the landowners under the acreage to be irrigated from the diversion dam which the government is expected to build shortly.

FREE BOOKLETS ON

60 REGISTERED HOLSTEINS 60

Santa Anita Rancho

OWNED BY ANITA M. BALDWIN

SANTA ANITA, CAL.

Tuesday, April 26, 1921

A large number of high record cows and daughters of high record cows of splendid breeding in this sale are bred to the $41,000.00 bull KING KORNDYKE PONTIAC ACME, one of the very greatest young bulls the breed has yet produced.

Seldom does the opportunity present itself to buyers to select from so many high record, richly bred females as will appear in this sale, which includes all of the high record cows at Santa Anita Rancho, among them

A 35 POUND COW that milked 112 pounds in one day. Bred to King Korndyke Pontiac Acme.

A 34 POUND granddaughter of King of the Pontiacs, now on yearly test.

SUNDRIE SUNBEAM GIRL, the famous cow that made 1033 lbs. butter from 28.905.9 lbs. milk in one year after dropping triplets. She recently freshened again, has increased her 7 days record. and is now milking over 100 lbs. per day.

A 22 POUND JUNIOR 3 YEAR OLD daughter of Sundrie Sunbeam Girl, heavy with calf to Prince Walker Cornucopia.

27 AND 24 POUND DAUGHTERS of the 1117 pound yearly record cow Mosetta Mutual Paul Johanna, both on yearly test.

A 27 POUND DAUGHTER of Johanna McKinley Segis. Now on yearly test and will finish the day after sale with right around 1000 lbs. butter.

MANY OTHERS with records up to over 26 pounds butter in 7 days, including a splendid lot of 2 and 3 year olds.

Two Herd Bulls Will Sell

MERCI LAD KORNDYKE BURKE, by De Kol Hengerveld Burke and out of Winnie Korndyke Cornucopia De Kol, the first cow to make over 1200 lbs. butter in one year in California. He was Grand Champion bull at 1920 California State Fair, and has a fine list of A. R. O. daughters with records up to over 30 lbs. butter and 600 lbs. milk in 7 days for a junior 4 year old.

PRINCE WALKER CORNUCOPIA, the highest record son of Prince Gelsche Walker. his dam being Alba Sadie Cornucopia Creetia, twice over 34 lbs. butter in 7 days. best record 36.18, and she made 866.28 lbs. butter in one year at a previous freshening. He is a first class individual and qualified to go to the head of any herd.

A CHOICE LOT OF YOUNG BULLS will appear in the offering, all sired by Prince Walker Cornucopia and out of dams of most popular breeding.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

TURKEYS

Turkeys — "Goldbank Boy." Champion Giant Bronze young tom. First Prize Cockerel at the New York, Madison Square Garden Show, the premier show of America, with 4311 poultry exhibits, held January 18th to 22nd, 1921, has just been imported by us, arriving at our mountain ranch February 26th. His sire, "Goldbank VIII," was grand champion at the same show, winning first in Cock class. We have mated this young champion bird to a limited number of twenty and twenty-one pound fancy, highly colored, eastern bred hens, also just imported. No eggs of this strain for sale this season at present.

A thirty-six pound yearling son of "Copper King V," the famous thirty-eight pound yearling giant bronze grand champion of the 1919 Madison Square Garden Show, will head our other flock—having mated him to our choice twenty pound hens. Egg prices reasonable. Two young toms of this last strain on hand for immediate delivery. For further particulars address: Bronze King Mountain Farm, Box 308, Calistoga, Napa County, California.

Large Number of Choice Bronze Toms and hens, also geese and herding Collie Dogs. Shipped from St. Helena and San Miguel. John G. Mee, San Miguel.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

THE RICHEST POOR FARM

(Continued from Page 499.)

Superintendent Harriman gives a most informing statement as to the steps by which this increased production was secured.

By Superintendent Harriman

The first great improvement was made by the use of King Jones Homestead, 129493. Although out of an untested dam, the excellent quality of his near ancestors made him very prepotent for good. He was a double grandson of Fobes Tritomia Mutual De Kol and both his granddams were daughters of Homestead Junior De Kol. This makes him 75 per cent the same blood as Lady Oak Fobes De Kol, 36.44 and 991.5 pounds in 365 days. Also Jessie Fobes Bessie Homestead, former world record four year old with 34.96 in seven days and 142.16 in 30 days. The sire only had three daughters which were given the benefit of advanced registry testing, and one of them became California state record four year old for milk in 30 days, with 2,772 pounds. One son of the above bull was also used for three years.

In December, 1916, we purchased a son of our present senior herd sire, King Segis De Kol Mead, and many of his heifers are now coming into milk, most of them, however, from grade cows. This bull was out of a 34 pound daughter of King Pontiac Topsy, was an excellent individual and transmitter as well. One of this bull's grade daughters recently freshened and in the first five weeks made as much milk as her dam produced in her entire first lactation period. We have a few registered daughters of this bull which will be placed on test as they freshen.

We later purchased a daughter of King Segis De Kol Mead which gave birth to a fine bull calf from a Colantha Johanna Lad grandson, and this bull has been used here for some time. The dam of this bull, Whittier Pontiac Netherland 4th, is the oldest daughter of King Segis De Kol Mead to be given the benefit of an official test.

As a junior four year old she made a record of 28.75 pounds butter in seven days and is being continued for yearly test. She is being milked three times a day in the stanchions with a hundred others and is receiving no special treatment other than an allowance of grain in proportion to her production, yet has produced 411 pounds of butter in three and one-half months. This is the third yearly test period for this cow and she has given us three calves in two years and three months preceding her last freshening. This cow is remarkably persistent, a regular breeder and a wonderfully fine individual, and was in fact one of the principal reasons for our recent purchase of her sire.

Having used a son and then a grandson of King Segis De Kol Mead and having studied three of his daughters in this herd, we welcomed the opportunity to purchase him last December, as we believe that his good qualities will be strengthened by line breeding with King Korndyke Pontiac Mead, the wonderful young bull which we purchased last May from A. W. Morris & Sons. This young bull is a son of De Kol of Valley Mead 2d, a 1,000 four year old that produced an 1,100 pound three year old daughter, and is sired by King Korndyke Pontiac 20th. King Segis De Kol Mead is a son of De Kol of Valley Mead, who is the founder of this famous California family and is a paternal brother of Segis Pontiac De Kol Burke, whose daughter, Miss Aaggie Acme Burke, is dam of the $41,000 Baldwin bull. We believe that this cross must inevitably produce individuals with the character and producing ability of the wonderful ancestors back of these two sires. Our first three heifers from King Korndyke Pontiac Mead have arrived during the past month and we have great hopes for their future.

LEGAL QUERIES

(Continued from Page 491.)

why the whole of the estate should not be assigned to the use of the family. If, on hearing, the court finds net value of estate over encumbrances of record of the widow upon the date of the death of the deceased does not exceed the sum specified, the court by decree assigns to the widow, or in case there be no widow, then to the minor children, the whole of the estate subject to encumbrances and after payment of the expenses of the last illness, funeral charges and expenses of administration. The whole of the title thereupon vests in the widow and no further proceedings in administration are then required. In the first instance a petition for administration is required and administrator appointed and thereupon the proceedings above described taken.

Juvenile Court Will Aid

There is a family of father, mother and six children. The oldest child is 16 and the rest range down to six years. The father has met with a severe accident, throwing the support on the mother and children. The oldest boy has come under the baneful influence of a designing person and fails to do his duty to the family. The result is that the family are liable to lose their property. What can be done?—Subscriber, Oxnard.

The case is quite clearly one for the care of the juvenile court, under the provision for dependent children. This provides that in case the parent of a child is unable to exercise proper parental control or where the child is in need of such control or where the father cannot provide for the necessities of life and has no means to provide for such necessities or where the minor persistently refuses to obey the proper orders or is beyond the control of his parent or is in danger of leading an idle life, such child may be declared a dependent person and placed under the juvenile court. Aid could also undoubtedly be obtained for the family from the mother's pension law. By invoking the aid of the juvenile court it does not mean that the child is made a criminal in any respect, but the stronger authority intervenes where it is found that such authority is necessary.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

of California Cultivator, published weekly at Los Angeles, Cal., for April 1, 1921.

STATE OF CALIFORNIA,

County of Los Angeles, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Frank J. Ironmonger, who, having been duly sworn according to law, deposes and says that he is the publisher and business manager of the California Cultivator and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse side of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business manager are:

NAME OF—	POST OFFICE ADDRESS
Publisher, Cultivator Publishing Co.,	Los Angeles, Cal.
Editor, C. B. Messenger,	Los Angeles, Cal.
Managing Editor.	
Business Mgr., Frank J. Ironmonger,	Los Angeles, Cal.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding one per cent or more of the total amount of stock).

Cultivator Publishing Co.,	Los Angeles, Cal.
R. M. Teague,	San Dimas, Cal.
Frank J. Ironmonger, Hollywood,	Los Angeles, Cal.
J. H. Yetter,	Los Angeles, Cal.
W. R. Wood	San Dimas, Cal.
E. H. Sanford	Claremont, Cal.

3. That the known bondholders, mortgagees, and other security holders owning or holding one per cent or more of the total amount of bonds, mortgages, or other securities, are: (If there are none, so state). None.

4. That the paragraphs next above, giving names of owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholders or security holders appear upon the books of the company as trustees or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest, direct or indirect, in the said stock, bonds, or other securities as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is ... (This information is required from daily publications only.)

FRANK J. IRONMONGER, Business Manager.

Sworn to and subscribed before me this 29th day of March, 1921.

(SEAL) ROBERT WHITFIELD.

Notary public in and for Los Angeles County, Cal.
(My commission expires April 4, 1923.)

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote—"Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa.—"Not a case of white diarrhoea in three years." C. O. Petrain, Moline, Ill.—"I never had a sick chick all last season." Mrs. Wm. Christians, Olive Ridge, N. Y.—"Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and $1.50 pkgs. Baby Chick Book FREE.

The Case for the Capon

By Jean A. Koethen

"CAN you give me some information in regard to capons?" writes a Whittier subscriber. "At what age are they marketed? What should Rhode Island Reds weigh? What would be a fair guess at cost of raising? How much feed would they consume? Is there a market in Los Angeles and how does it compare with San Francisco? How does it compare with Eastern markets? Do capons have to be dressed or can they be shipped alive? What are they fed mostly? What would be the difference between live and dressed birds in price?"

One of the strongest arguments for caponizing is that the birds can be marketed at any age. The flesh of a rooster becomes hard and tough by the time he is six months old. He must be marketed as a soft roaster at four or five months or he is worth very little. Capons are usually held till they are about a year old, when they should weigh around ten pounds, though their weight not infrequently reaches 12 or even 14 pounds. At this age, when a rooster would be only soup meat, the capon is as tender and delicious as a young pullet.

The weight of capons of the American breeds is around ten pounds. Light Brahmas and Orpingtons are heavier. The vigor of the stock and method of feeding, however, are just as important in determining weight as they are in determining egg production.

The cost of raising capons is about the same as that of feeding a laying hen, possibly a little less. Some capon producers let the capons run with the hens. It costs about $2 to bring a pullet to six months of age, or laying maturity, and last year it cost $3 a year to feed her after she began to lay. Feed is cheaper now, and it is hard to say what it will cost to feed either pullet or capon. Three dollars for bringing a capon to the age of one year would be a safe guess, and it may be less. A laying hen consumes from 75 to 90 pounds of feed in a year.

A Growing Market.

A couple of years ago commission men told me there was very little demand for capons in Los Angeles. There is now, they say, a steady and growing market. Prices here and in San Francisco are approximately the same. Capons retailed this season for 65 and 70 cents a pound and were bought by wholesalers for 46 to 52 cents live weight. A man who raises a good many tells me he is able to sell them all in his own neighborhood. He charges five cents a pound for dressing, selling the birds for 65 cents alive or 70 dressed.

I have no figures as to Eastern prices, but from the fact that Farmers Bulletin 349, U. S. department of agriculture, says capons sell in season for 25 to 35 cents "and often more," I judge the Los Angeles market is at least as good. Capons, like other market fowls, are shipped alive. For private sale to a hotel or restaurant they might be dressed, but that would be by special arrangement. In the vicinity of Los Angeles one may almost always get in touch with a buyer who drives around and collects market poultry. The price paid is not quite as good as may be had by shipping direct to the city, but when you count all expenses there is not much difference.

Feeding Capons

A young capon for several months after the operation requires a good growing ration, such as all young birds should have. A good deal of green feed is desirable all through its life. In the fall, toward marketing time, the ration may be made more fattening than is given pullets by the addition of corn meal oats to the laying mash. Later on moist mash may be given once or twice a day. If it is possible during the last two weeks of fattening to keep them in crates and feed as broilers are fed there will be greater weight and greater profit.

Poultry Queries

Conducted by Jean A. Koethen

Mating Turkeys

I have three turkey hens but no tom. Will the hens mate with a neighbor's tom if he is put in the yard? I have been told that after the hens have laid a clutch of eggs and go broody they will mate. Is this true?—Subscriber, Corona.

The hens will mate as soon as they have been with the tom long enough to feel acquainted, and one mating fertilizes a whole clutch of eggs. Breeders, however, keep a tom with a pen of laying turkeys all the time. They say this is the only way to be certain of fertility. As you have only three hens I think you might expect fertility after two or three weeks.

Does the Germ Show?

After breaking an egg is it possible to know positively whether or not the egg is fertile? By what sign?—Subscriber, Corona.

I know of no way of distinguishing a fertile from an infertile egg before the germ begins to develop. On every egg, when it is broken, may be seen a little white spot. This receives the germ, but as far as I know, there is no change in its appearance until incubation begins. I may be mistaken If I am, somebody correct me.

White Comb

I have close to 1,000 year-old Leghorn pullets in large yards with houses 18 by 20, 150 pullets to the house. A month ago they had nice red combs but lately the combs have turned rather gray, like sunburn. They seem well and are laying better than 50 per cent. They have green barley twice a day, a mixture of dry and sprouted grain at night, dry grain in morning, mash all day, wet mash every other day. — Subscriber, San Gabriel.

Your hens are certainly well fed and their laying indicates there is not much wrong. I think they are getting a little out of condition from heavy feeding without quite enough room to move around in. There is a disease called "white comb," believed to be due to "dirt, over-crowding or lack of green feed" which is a good deal like the condition described. If you could give them 3 or 3½ square feet of floor space apiece instead of less than 2½, and increase the amount of greens so that they have a little before them all the time, it would be better.

Chicken Manure

Can you tell me how to handle chicken manure to keep flies away? I keep mine in a box, but the odor and flies annoy my neighbors.—Subscriber, Glendale.

A manure pit seems to be the proper thing. Dig as deep a hole as you can, and each time you put in manure, cover it with dry dust or sawdust and acid phosphate or kainit. The dust and phosphate keep the nitrogen from escaping, and there should be very little odor. Possibly you can accomplish the same end with a tight box.

Paralysis

Several of my five-month's old pullets have been stricken with paralysis. The droppings are variously colored; none of them normal. Can you help me?—Riverside.

Those pullets have eaten something that poisons them. What, is the question? Such cases have been reported

PCA

PCA CHICK MASH WITH BUTTERMILK

Feed PCA Chick Mash with buttermilk and keep the chicks WELL.

A healthy chick can ward off disease.

F. R. Richardson, the well known poultry breeder of San Gabriel, Calif., says of PCA Poultry feeds:

"I have been feeding PCA Mash for a number of years—I have never found its equal, either in the Buttermilk Mash for the Baby Chicks, or in PCA Egg (dry mash) for the hens and pullets — used to 'make my own' but have gone back to PCA because, in my opinion, your association executives know more about balanced rations for both Baby Chicks and grown Hens than any man, or set of men, I have ever met.

"With my flock of more than fifteen (15,000) thousand laying hens and pullets, I feed nothing but PCA Egg (dry) mash and other PCA products." (*Signed*)

F. R. RICHARDSON.

Feed diluted Buttermilk in PCA chick feeders—one chick feeder free on request, additional feeders 25 cents each.

There are more than 500 dealers handling PCA products in California alone. Ask your dealer for PCA. If he hasn't it do not take something "just as good"—Write us direct. Ask for sample copies of "Cooperative Poultryman," edited by M. A. Schofield, and PCA Chick Book—Free.

in flocks that have been fed dirty or spoiled grain or corn that has heated or become moldly. Hens that are on range sometimes get hold of a dead chicken or gopher, and ptomaine poisoning results. Sometimes they get a bit of some of the poisonous chemicals used in spraying trees, and this poisons them. Better shut the flock up while you make a thorough investigation. Sometimes the beef scrap in the mash is not as fresh and sweet as it should be. After you shut up the birds drop the laying mash for a while and feed plain bran insead. Examine the feed carefully, especially the corn. A little mold in corn sometimes works havoc in a flock. As you say there are 85 pullets and only half a dozen are affected, it looks as if the trouble were due to something they have picked up outside rather than to anything in the feed.

Limber Neck

My hens seem to have crooked necks. Sometimes they stretch them and the neck inclines to one side. I feed rolled barley, mash and milo.—Subscriber, Redlands.

Please note answer to Riverside subscriber. Both paralysis and limberneck are due to intestinal disturbance which almost always comes from some kind of spoiled food. Intestinal worms sometimes produce the same symptoms, but you would know if they had worms. Examine the feed carefully and make sure there is no mold or spoiled beef scrap or other meat. Your ration is rather limited. You do not mention green feed, which is very important, and it would be better to feed three grains than two.

Cripples

Mrs. C. A. M., of Norman, Oklahoma, writes in regard to incubator cripples: "When I read the answer to Mrs. K. B. H., Redlands, I felt in all fairness to those helpless little chicks I ought to tell my experience. I have used several incubators for over 15 years and have found that cripples are the result of not turning and rolling the eggs thoroughly. This stirring gives the embryo chick the exercise it cannot get otherwise. Just as a child's limbs need exercise to keep them from getting stiff, so do the little limbs of a chick require motion to develop the muscles. I had a neighbor who said it was all bosh to turn and roll the eggs two or three times a day and to prove it she just turned the number on her eggs up in the morning and down at night, and out of 100 eggs she got 47 cripples."

Doubtless Mrs. C. A. M. is right in saying failure to turn the eggs is one cause of cripples, but that it is not the only cause is proved by my own experience. The first incubator I ever owned was set up without the oversight of the agent, and the thermostat was put in upside down so that it was impossible to control the heat. At hatching time the heat ran very high and nearly every chick that hatched was a cripple. If I recollect rightly, we got ten sound chicks out of 30 or 40. I ran several incubators after that, and ran this one after the thermostat was fixed another season, always turning the eggs according to directions twice a day, as I had the first time, but I never had more than an occasional cripple, except in one or two cases where I knew the heat had run too high at hatching time.

The cooperative marketing bill passed in the last Arizona legislature has become a law upon signing by Governor Campbell. This law combines the good features of the California cooperative marketing law and does not conflict with the Arizona laws governing the corporations of the state. It will be taken advantage of immediately by the cotton growers of the Salt River Valley.

Citizens of Gallup, New Mexico, are planning to turn out to work about 20 miles of road west from that town into Arizona. It has also been suggested that possibly the citizens of Clifton, Duncan and Franklin, Arizona, may offer a "reprisal" in the form of road work on the road from these towns into Lordsburg, New Mexico.

LET your chick babies be buttermilk babies this year and watch 'em thrive and grow. Start them right, start them on Globe "A-1" Baby Chick Mash, **the buttermilk baby chick mash.**

There is practical and scientific knowledge put into Globe "A-1" Baby Chick Mash. It isn't just a feed. It's that and more—a health protector. The generous quantity of pure dry buttermilk which it contains gives it this invaluable property. The lactic acid content cleanses the baby chick's system, and protects it from the ravages of disease. **(It has proved a preventative of white diarrhoea and coccidiosis.)**

AFTER THE CHICKS ARE OLDER

After your chicks are about 6 weeks old change the ration to Globe "A-1" Growing Chick Mash (containing dry buttermilk) and when the pullets are 5 months old begin to feed Globe "A-1" Laying Mash (containing dry buttermilk) and get ready for the full egg basket.

Nutritious hearts of grain, meatine, selected ground grains **and plenty of pure dry buttermilk**—that's Globe "A-1" Baby Chick Mash—why shouldn't the chicks grow well on it?

Pelts—Large, long wool, 45@75 each; medium, 25@45 each; short wool and shearlings, 10@25 each.

Goat skins — No. 1 common, 10@30 each; No. 2, 5@10 each; badly damanged and small kids, worthless.

Tallow—No. 1 white and hard, 4½ per lb.; No. 2, 3 per lb.; No. 3, dark and greasy, 1@3 per lb.

Wool—According to qquality and condition, 5 per lb. and up.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock April 5, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading

Potatoes: Supplies liberal, market unsettled. Stocktons: Burbanks, quality poor, 1.75@2.00; few best 2.25@2.50. Idaho: Russets, mostly 2.25@2.35. Local: White Rose mostly 2.25. New potatoes: 10@11 per lb. Sweet potatoes: Supplies moderate, market steady. Best mostly 2.00@2.25 lug. Arkansas and Texas, 7@7½ lb.; jobbing sales, 6@6½ lb.

Onions: Supplies heavy, market dull. Stocktons: White Globes, cold storage stock, 75@1.00; Browns, mostly 35@65 per cwt. sacked.

Garlic: Local best mostly 12@15 lb.; poorer 8@10.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock April 5, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Best doz., 75@1.00; poorer wide range.

Asparagus: Supplies heavy, market weak. Local: Mostly 15@16 per lb. Northern: 11@12 per lb.

Beets: Doz., 40@45; sk., 1.75@2.00.

Cabbage: Field cr. best mostly 75@85; poorer 50; best 1.00.

Carrots: Doz., 40@50; sk., 1.00@1.25.

Cauliflower: Supply moderate, field cr., best, 1.50@2.00; poorer, low as 1.25; few best high as 3.00.

Cucumber: Hothouse, best, 2.00@2.50 dozen.

Lettuce: Local field cr. quality poor, 1.00@1.25; best mostly 1.50@1.75.

Peas: Imperial Valley: Quality generally poor, wide range in prices, supplies cleaning up. Local: Best 10@11 per lb., jobbing sales 8@10.

Radishes: 15@20 doz.

Rhubarb: Crimson Winter, best bx., 75@90; Strawberry bx., 1.15@1.25.

Spinach: Doz., 20.

Squash: Summer, 1.45@1.50.

Tomatoes: Mexican, per lug, best 3.50; repacked lug, 3.75. Much poor stock at wide range in prices.

Turnips: Per doz., 35@40; sk., 90@1.10.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.00@2.25; special packed brands, 2.75@3.25; Imperial box, 4.75@5.25; small sizes, 4.25@4.50.

Lemons: Market dull, wide range in prices: Local stock: Packed, box, 1.50@2.25, few high as 2.75; loose, bx., 75@1.00; lug mostly 40@50.

Oranges: Supplies heavy, market dull. Navels market pack large size 3.00@3.50; small low as 1.75; special brands small sizes 2.75@3.25 large 4.00@4.25; packing house culls, 25@50 box; few best 75. Tangerines, best, 6@7 lb., small, 4.

HONEY

Supplies heavy: Poor wire inquiry. Movement slow, market weak. Carlots f. o. b. usual terms; few sales White Orange Blossom 13@13½; White Sage 12@12½; Light Amber Alfalfa 6½@7; Light Amber Sage 7½@8½; White Alfalfa 7½@8½. Hawaiian White 7½; Light Amber 6; Honey Dew Honey 5.

Beeswax sacked in less than carlots, per pound, Hawaiian, light color 35; domestic, light 32@34; dark low as 26.

Producers seem more willing to sell at lower prices and supplies are cleaning up in some sections. The local demand for small lots at higher prices is helping to absorb the surplus. The new crop will probably be heavy in another month, due to the favorable season. It is estimated that approximately 10 per cent of next year's crop will be comb, but supplies are now exhausted. San Diego County reports 17,000 colonies registered now, and in thrifty condition.

WALNUTS

California Walnut Growers Association's prices: Soft Shell, No. 1, 22½; Soft Shell, No. 2, 16½; Budded, fancy, 26½; Budded, standard, 22½.

GRAIN AND FEEDS

Grain Exch. price bid April 5:

Milo: Carlots 1.67½; No. 3 Eastern bulk, 1.45.

Corn: No. 2 Yellow, bulk 1.55; sack 1.60.

Barley: Carlots, 1.20@1.22½.

HAY

Alfalfa Growers of California report under date of April 4:

There were 280 tons received on the Los Angeles tracks, with 50 tons held over as against 370 tons the week ending April 2.

89	190	...	$11.40
84	156	...	11.30
56	218	...	10.65
3	300	...	9.65
1	240	80	6.65

Three cars, 19 consignors, total $4,829.30.

HIDES AND PELTS

The market on hides and skins continues weak and prices unsettled. Tanneries throughout the United States are shut down or running part time, causing light demand for raw stock.

Damaged and extra grubby hides in winter condition will scarcely bring enough to pay freight on them.

The list below will show our estimate of today's values:

No. 1 heavy hides, 60 lbs. up, 3; do, medium, 45 to 60 lbs., 3; do, light, 30 to 45 lbs., 5; do, native bulls, 2; No. 1 center branded hides, in all grades, 2 less than base price, and No. 2 center brand, 3 less. No. 1 wet salt kip, 15 to 30 lbs., 5; No. 2 wet salt kip, 15 to 30 lbs., 3; No. 1 wet salt calf, trimmed, 7½; No. 2 calf, 2 per lb. less.

Dry hides, 16 lbs. and up, No. 1, 8; dry kip, 7 to 15 lbs., No. 1, 9; dry calf, under 7 lbs., No. 1, 10. Dry stags and bulls, one-third less than dry hides. Dry glue hides, kip and calf, one-half price or less, according to quality. Pickled hides and skins, 3 less than dry flint. Dry salted hides and skins, 6 less than dry flint.

Dry Horse Hides: No. 1, large, skinned to hoof, 1.00; do, medium, 75; do, small, 50; No. 1 colt, 25@50. All cut, scarred or badly cured hides are culls, and worth proportionately less.

Wet Salted Horse Hides: No. 1, large, skinned to hoof, 2.00; No. 1, medium, skinned to hoof, 1.50; No. 1, small, skinned to hoof, 50@1.00; No. 1, colt, skinned to hoof, 25@50.

Dry Horse Hides: No. 1, large, skinned to hoof, $1.50; No. 1, medium, skinned to hoof, 1.00; No. 1, small, skinned to hoof, 50@75; No. 1, colt, skinned to hoof, 25@50. All cut, scarred or badly cured hides are culls and worth proportionately less.

Goat Skins: No. 1 large, not matted, Angora, 30 up; No. 1, medium, not matted, 15@20; No. 2, 5@10. Damaged skins and very small kids, worthless.

Pelts: Long wool, 9 to 12 months' growth, 65 up; medium wool, 6 to 9 months' growth, 50@60; short wool, 3 to 6 months' growth, 25@40; shearlings, good, 1 to 3 months' growth, 10@20; shearlings, shaved or damaged, 9@10. Lambs, large, long wool 25 up; lambs, small, 15@20;

POTATOES AND ONIONS

Wholesale prices:

Potatoes: Street prices: River, 1.90@2.15 for No. 1; do, Oregon Burbanks, 2.00@2.25; New, 7@9 lb. Idaho Gems, 2.25@2.40. Sweet potatoes, nominal; Nancy Hall, 5.00@6.50 per 100 lbs.

Onions: Australian brown, 50.

Garlic: New, 7@10 lb.

VEGETABLES

Wholesale selling price:

Asparagus: Lb., Field run, 34; fy. graded, 4@6; extra fy., 6@8; green, 3@6.

Artichokes: Doz., 25@85.

Milo: Cal. Red, 1.95@2.00; Eastern Red, 1.60@1.75.

Kafir: Eastern, 1.60@1.70.

HAY AND FEED

Alfalfa Growers of California report under date of April 4:

There were 1,031 tons received in San Francisco.

No. 1 Dairy	19.00
Standard Dairy	17.00

Under date of April 2 A. W. Scott Co. says:

Receipts the past week 1,031 tons. Business has dragged badly and the week sees the end of rather an unsatisfactory month's business in all lines of hay and feed, unsatisfactory, because it was marked by a disinclination on the part of both buyer and seller to trade and an uncertainty as to prices and futures which destroys confidence and limits trading to the very minimum. A strong healthy hope for the future is perhaps the most encouraging feature. The recent movement intended to weld all California into one working booster force to improve business conditions and market California products, has created a feeling of hope and determination that is reflected in all avenues of business. The so-called buyers' strike is undoubtedly to be the first sentiment that will be affected by this concerted action to improve conditions. Alfalfa has been dullest of all grades and sales at slightly reduced figures throughout the interior are reported.

Mill and dairy feeds have been affected seriously by the dropping of wheat, corn and oats to still lower levels, and the market on all grades has closed weaker and at fractional lowerings on all prices.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00

Citrus Markets

Los Angeles, April 6, 1921.

Oranges are being received rather more satisfactorily, f. o. b. quotations running around $3.25 for 150's with severe cuts on small sizes, likewise the sizable premium for large sizes.

Little interest in lemons is shown save that liberal shipments are now being made by water, which is giving opportunity to dispose of some of the fruit which would otherwise go to the "wash."

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 14,747 cars; lemons, 3,026; total, 17,773. To same date last season: Oranges, 13,488; lemons, 2,643; total, 16,131. From Central California to date, this season: Oranges, 4,379; lemons, 124; total, 4,503. To same date last season: Oranges, 3,751; lemons, 279; total, 4,030. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

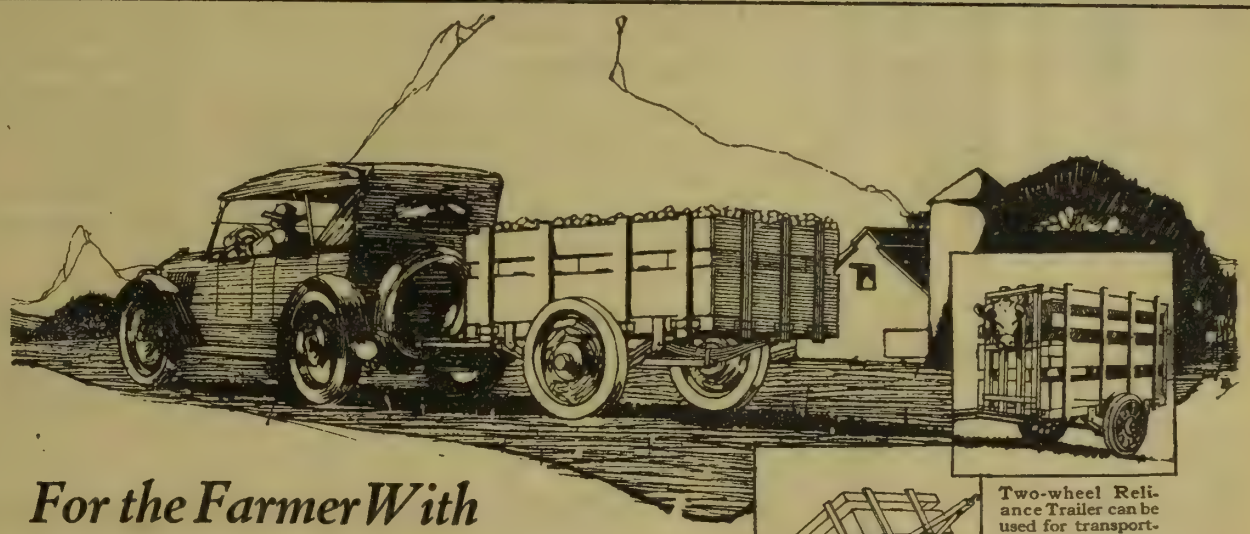
California Plow Company

140 Polhemus Street. San Jose, Calif.



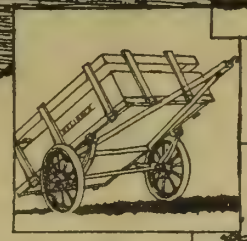
For the Farmer With Small Loads To Haul

Automobiles are not made to carry merchandise. Yet most farmers make a practice of transporting small lots of produce or material in their cars not realizing, perhaps, how this increases costly depreciation and tire-wear and how boxes, sacks, etc., scratch, mar and tear.

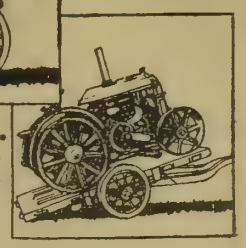
Why not utilize a small 2-wheel Reliance Trailer for minor hauling—towed behind your auto? It saves your car and saves much time. It enlarges your hauling capacity. These trailers pull easily without strain on your car and are balanced correctly for perfect tracking and smooth running.

Reliance Trailers are built throughout of wrought steel—light in weight but strong and durable. Workmanship and materials absolutely guaranteed. Built in capacities of 1200 lbs., 1-ton, 1½-ton and 2-ton.

Why not write for prices and the name of our nearest dealer?



Two-wheel Reliance Trailer can be used for transporting live stock.



Light, 1200-lb. capacity 2-wheel Reliance Trailer for extra light work and for campers, etc.

Reliance 2-wheel trailer with special tilting bed. Specially adapted to moving tractors, but can be used for transporting other merchandise. Has side stake pockets and can be fitted with any type body, or easily interchangeable bodies of various types. Bed locks automatically when swung into level position for running.

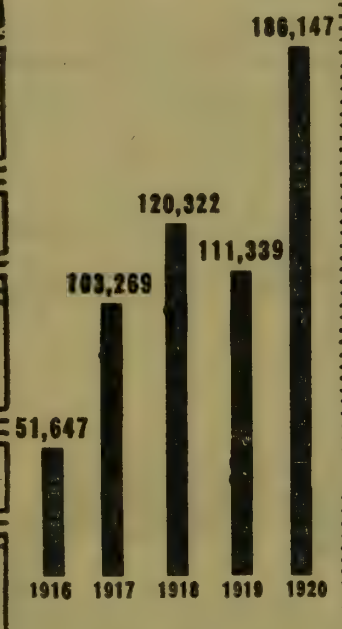
CHEVROLET



Chevrolet Sales Record

THE production schedule of Chevrolet "Four-Ninety" Models for the seven months from January 1st to July 31st, 1921, is fifty thousand cars.

We will give $70 to each retail purchaser of a new open car or light delivery model, and $100 to each retail purchaser of a new closed car, provided we manufacture and sell fifty thousand Chevrolet Model "Four-Ninety" cars between January 1st, 1921, and July 31st, 1921. This offer to be subject to the terms as set forth in full in the refund certificate which will be delivered to each purchaser.

Fifty thousand cars is the minimum which will secure substantial savings in cost in manufacture. These savings will be passed on to the purchasers of these fifty thousand cars.

This plan is in keeping with the Chevrolet policy to make the price of its product as low as quality manufacture on a large scale will permit. It is in keeping with the Chevrolet purpose of providing quick, convenient, economical transportation at a cost within reach of those who want an automobile.

Each purchaser of a Model "Four-Ninety" will receive a certificate from his dealer, or from the Chevrolet retail store manager. This certificate will be redeemed as indicated on its face.

This is a straightforward business proposition presented in a straightforward way. Whether you are in the market for a new car or not, you must not fail to learn the details of this unique and simple plan. It offers to every man of sound business judgment an opportunity to take advantage of the best automobile value obtainable.

Retail purchasers of Model "Four-Ninety" cars since October 1st, 1920, will receive their certificates through their local dealers or retail stores on application to them.

Important Crops, Fruit Products and Livestock Products

The Director of the Census announces, subject to correction, the following preliminary figures for the United States from the Census of Agriculture for the year 1919, with comparative figures for 1909:

* * *

For some reason figures as to raisins and dried grapes are not given for 1909, but the $50,000,000 crop of 1919 is a material increase over that of 1909, and we think we are entirely safe in saying that by far the biggest half of that $50,000,000 is due to cooperation.

* * *

Another illuminating item as to the benefit of cooperation is the report as to oranges — in 1919, 27,900,000 boxes as against 19,487,000 in 1909, but note the dollar return, $84,000,000 for the 1919 crop as against $17,566,464 for the 1909 crop. Both California and Florida are cooperatively organized.

* * *

One of the field crops which is of particular interest to California is sugar beets. The United States produced over 6,000,000 tons in 1919 as against less than 4,000,000 tons in 1909. The cash return for this crop was $66,000,000 in 1919 as against $19,800,000 in 1909. Sugar cane, on the other hand, shows a great decrease in tonnage though a most satisfactory increase in return.

* * *

Livestock reports are not so satisfactory. Note the material reduction in the amount of butter produced on farms. Cheese shows still greater reduction. Sale of milk, however, has materially increased as is shown by the half billion gallon increase there.

		Acreage	Production	Value
CROPS				
Corn	1919	87,000,000	2,385,000,000 bu.	$3,569,000,000

Special Farm Paints

For Buildings, Silos, Machinery, Wagons, Etc.—Made for Western Climate

We make special paints and varnishes with western farm needs and western weather conditions in mind.

It's vitally important that you get such paints. They must be the best that any one can make, for real economy lies only in good paint.

It costs more to rot a building than to paint it. Paint now if your buildings need it, and save money.

Beware Cheap Paint

But use the *best* paint, for the best if properly applied will be good from five to ten years hence. Cheap paint, on the average, starts cracking in twelve months.

It's what paint covers that you want to save—not merely a few cents per gallon in *first* cost.

Cheap paint doesn't spread as easily or as far as good paint. So when you figure *labor* and *square yards* covered, cheap paint costs just as much as good paint.

Cheap paint, in practically every instance, is the most expensive you can buy.

For 72 Years

The paints specified by Fuller are the result of 72 years' experience in the making of all kinds of paints, varnishes, etc., for western use.

We use the best materials as others do. But we combine them with a 72-year knowledge and long-time skill. Our Pioneer White Lead-base is finely ground—pure white. It must pass through silk screen with 40,000 mesh to the square inch.

We use special machines for mixing the materials in scientifically exact proportions. Fuller paints are noted for covering capacity, ease of spread and great durability.

If you want from five to ten year protection for your property investment, get Fuller's—western paint for western weather conditions—a paint *you know*.

Fuller's SPECIFICATION Farm Paints

House Paint - Barn & Roof Paint
Wagon Paint - Rubber Cement Floor Paint

HOUSE PAINT: Pure Prepared Paint, Phoenix Pure Paint for Painting Houses. The purest, best protection and most durable paint made. Made in 32 colors.

BARN AND ROOF: A protective coating for Barns, Roofs, Fences. Dries with a good gloss and wears. Economical in cost and dependable in quality. Six colors to select from.

PACIFIC WAGON PAINT: Adapted for repainting Agricultural Implements, Farm Wagons, Windmills. A glossy and durable finish offered in 7 colors.

RUBBER CEMENT FLOOR PAINT: A sanitary, waterproof and durable paint for floors of kitchens, closets. Attractive in color and gloss. Dries hard over night. Made in 12 colors.

Also makers of Decoret, Washable Wall finish, and Silkenwhite enamel.

W. P. FULLER & CO., Master Paint Manufacturers for 72 years.

Established 1849, San Francisco. Branches in 16 Cities in the West. Dealers Everywhere

Free Advice on Painting

IF you cannot get a master painter and wish to paint your home yourself, but do not know much about painting, ask Fuller's Specification Department for advice. How to treat the old paint, What color scheme to use. How many coats. The proper brushes. The best time to paint, etc.

Send photo of your house or barn with dimensions of the roof and siding, and we'll estimate the cost—without obligation.

Take advantage of Fuller *Service* as well as Fuller Paints. Write us *now*. Take steps to *paint now*. Don't let weather depreciate your investment.

Send Coupon For Interesting Book—Free

Mail coupon for "Save the Surface"—a free book that tells of the importance of good paint.

We'll send also our booklet describing Fuller's Specification, Farm Paints, Varnishes, etc.

Send coupon now. Find out what good paint means to you.

W. P. Fuller & Co.
Dept. F-31 San Francisco.

Please send me, without charge, a copy of "Save the Surface" and your booklet of farm paints and varnishes.

California Cultivator

Vol. LVI, No. 16 Los Angeles, April 16, 1921 One Dollar Yearly

What Will the 1921 Harvest Be?

By Fruit Growers and Direct From the Orchards

CALIFORNIA produced in 1920 345,000 tons of peaches, 90,000 tons of pears, 95,000 tons of prunes, 115,000 tons of apricots, 18,700,000 boxes of oranges, 4,500,000 boxes of lemons, 180,000 tons of raisins, nearly 600,000 tons of table and wine grapes, 15,000 tons of cherries, 10,000 tons of figs, 5,500 tons of almonds, 21,500 tons of walnuts, with cantaloupes, vegetables, and a number of other crops in other thousands of tons.

What she will produce this year is a live question even this early when some of the trees are still in bloom. It is a live question and open for discussion this early because of several considerations such as irrigation, cultivation, marketing and plans for the entire year's work on the part of the producer. Of course this matter of probable production is only one of many other factors which will aid in deciding the coming year's methods. Only a few weeks ago the peach, apricot, pear and other growers asked: "Why shall we spend large sums in further cultivation and irrigation other than to keep our groves alive for other years' productions? The canner has immense quantities of holdover; warehouses even are filled with last year's stock, and the consumer is ceasing to buy, but frost conditions, slightly in California and rather heavily in many other sections, have reduced estimates as to the coming season's output."

Plainly the weather conditions have materially reduced the output of California. This reduced tonnage may be in keen demand not only for California and Eastern markets but possibly for export to Europe. Hence the grower is looking at his orchard from rather a different angle than 30 days ago. What do the producers think as to the coming season's outlook? Here are some estimates from different parts of the state:

California Cooperative Crop Reporting Service

Kauffman of the federal bureau of crop estimates and the California department of agriculture reports April 1 conditions:

Grain of all kinds made a good growth and much seeding of barley resulted following the delay occasioned by excessive moisture during February. As a whole pastures were in excellent condition and livestock in better form than usual, with prospects of some early grass beef. Even temperatures brought out fruit blossoms early and freely and a good set of fruit generally followed. Frost occurred more or less in all parts of the state, April 4, 5 and 6, and some damage is reported to deciduous fruits and raisins, although it is not believed to be very serious.

Claud D. Tribble, Elk Grove, Sacramento County

Almonds: 60 per cent.
Apples: 100 per cent.
Apricots: 70 per cent.
Cherries: 100 per cent.
Peaches: 100 per cent.
Pears: 100 per cent.
Prunes: 100 per cent.
Plums: 100 per cent.
Grapes: 90 per cent.
No frost damage so far.

Niles Cannery, Alameda County

Almonds: One-half crop.
Apricots: 40 per cent normal crop.
Cherries: O. K.

W. D. Butler, Horticultural Commissioner, Napa County

Almonds: 50 per cent. Brown rot.
Apples: 100 per cent.
Apricots: 10 per cent. Brown rot.
Cherries: 100 per cent.
Peaches: 75 per cent. Brown rot.
Pears: 90 per cent. Some rot.
Prunes, 125 per cent.
Grapes: 100 per cent.

H. J. Baade, Farm Adviser Napa County

Apples: 100 per cent.
Apricots: 10 per cent. Brown rot destroyed most of our 'cots.
Cherries: 75 per cent. Rain and unfavorable weather conditions destroyed 25 per cent.
Peaches: 75 per cent.
Pears: 80 per cent.
Prunes: French, 100 per cent; Sugars, 100 per cent; Imperials, 50 per cent.
Grapes: 100 per cent.

F. C. Brosius, Horticultural Commissioner, Sacramento County

Almonds: 55 per cent. Some frost damage.
Apples: 75 per cent.
Apricots: 70 per cent. Slight frost damage.
Cherries: 90 per cent.
Peaches: 100 per cent.
Pears: 100 per cent.
Prunes: 90 per cent.
Grapes: 90 per cent. Slight frost damage some districts. Some damage to trees account sour sap.

Sutter County Farmer, Yuba City, Sutter County

Almonds: One-half crop.
Apples: Can't estimate.
Apricots: Fair.
Cherries: One-half.
Peaches: 60 per cent.
Pears: Good.
Prunes: Full crop.
Grapes: 25 per cent.

Fred K. Howard, Fresno, Fresno County

One of the most serious frosts of recent years played havoc with fruits in part of the San Joaquin Valley on the night of April 3. The most serious damage was through one of the best fruit districts, extending from the Clovis district in the north to Kingsburg in the south, being particularly serious around Clovis, Sanger, Del Rey, Parlier, Selma and Kingsburg. Less severe frosts also occurred Monday and Tuesday, doing some damage in other districts.

Like all frost injury, the extent of the damage is difficult to estimate, but in some districts there will be a total crop loss, except for a possible second crop on some varieties.

Officials of the Associated Raisin Company estimate the loss at between 20 and 25 per cent of the total crop of raisins. Table grape varieties probably sustained an equal loss. Other deciduous fruits in the severely frosted districts suffered severely.

Lester C. Reed, Simi, Ventura County

Owing to the rain during the blossoming period and the frosts the early part of this week we are nearly out of the 'cot business this year; about 25 per cent for the entire valley. Ventura County produced about 2,300 tons of dried fruit last year, which was a 50 per cent crop. A buyer for one of the big packers estimates 750 tons this year.

Thos. P. Redmayne, Horticultural Commissioner, Marin County

Almonds: The few grown in county show a good setting of fruit with no frost damage and are probably safe.

Apricots: Badly damaged by rains at blossoming time and main varieties almost a total failure.

Apples: Heavy with bloom and indications excellent.

Cherries: Not grown to much extent, but show good setting.

Peaches: Average crop indicated.

Pears: Bloomed well; too early yet to determine setting but appearances are favorable.

Prunes: Indicate an unusually heavy crop.

Grapes: Normal; no frost damage apparent.

The rainfall, which was somewhat above normal, interfered greatly with spraying operations.

Chas. F. Collins, Horticultural Commissioner, Tulare County

Almonds: Not of commercial importance.

Apples: Good prospects now (April 11).

Apricots: Very few grown.
Cherries: Not grown here.
Peaches: Some injury from frost in

(Continued on Page 518.)

DON'T WASTE THE FRUITS—CAN EVERY ONE

The outlook is better. Canned and dried fruits are moving and fruit growers are beginning to take at least a half a breath. California's output will be somewhat reduced, at least that is the general impression amongst growers and observers. With the holdover out of the way, as it probably will be within the next few months, and with frost reports from many eastern fruit growing sections indicating material reduction in eastern output, every ounce of California fruit should be marketed. The trade is not as yet fully reassured, hence the safety-first plan, which every grower should consider, is to be independent and ready for handling one's own fruit.

There are evaporators; there are home canning outfits. A home canning outfit with a little intelligent study and a little care on the part of the fruit grower will convert a quickly perishable product into one of permament value.

There are home canners of various sizes which will handle the small orchardist's output or an entire neighborhood's output. Farm bureaus and extension service of the state university unite in giving latest information as to methods of work. Cruess says in "Home and Farm Food Preservation": "Commercial food preservation cares for the bulk of the food products, but beside the food so preserved, there are many millions of jars and cans of fruits and vegetables, glasses of jellies, jams and marmalades and many thousands of hams and bacons 'put up' by the housewife and farmer. Much food that would otherwise be wasted is saved and in addition a varied diet throughout the year at low cost is made available in many homes. Usually this work is done over a hot kitchen stove during the rush of the fruit or vegetable season and, added to other household duties, becomes a heavy burden. The methods are empirical and by 'rule of thumb'; consequently they are not well understood and not especially interesting."

Besides the book referred to there is "Successful Canning and Preserving" by Powell. These helps, with two good eyes and intelligent questions, will aid any who wish to put themselves on a perfectly safe basis with a home canner.

There is opportunity not only for saving one's own crop but rendering service to the community.

Adventuring With Chickens

By Jean A. Koethen

DEAR DAD: Do you remember little Willie Snow who used to bring us milk? His father farmed Harvey Thomas' west 80 and his sister Lizzie married one of the Lewis boys—the red haired one, I think. Well, who should turn up here in Gardenwood the other day but little Willie, six feet tall and with a kiddie or so of his own. He doesn't live in Gardenwood—is farming a walnut ranch some 30 miles from here and feels mighty prosperous. He heard of us from one of the poultrymen in the neighborhood where he was buying some chicks and came right over to see us. Chickens are just a side line with him, he says, but they'll help keep the pot boiling till the walnuts bear; and furnish a little manure for the trees besides. I thought from the way he talked that he was planning to raise 50 or so just for fun, but lo and behold! when he took us out to the car (a real one, not a flivver) to show us the boxes all neatly packed in the tonneau, if there weren't ten boxes, each holding a hundred peeping fluffies!

"What under the sun," demanded Tom, "are you going to do with a thousand chicks?"

"Why, raise them, to be sure. I ought to get three or maybe four hundred pullets out of that lot, and I need every one."

He has built a no-yard house, he says, right in among the walnut trees, and as soon as the chicks are out of the brooder house they will go into

(Continued on Page 536.)

Agricultural News Notes of the Pacific Coast

Northern California

Beekeepers of Glenn County have organized. M. A. Saylor is president.

Rice farmers are planning to get in their seed as soon as possible this year.

General Grant and Sequoia national parks open May 24 to tourist travel and close October 1.

The annual meeting of the California Olive Association will be held in San Francisco on April 18.

Northern California wool growers have formed a corporation with headquarters at Red Bluff.

An order for beehives from Chu Chin, China, has been received by the Diamond Match Company at Chico.

Delta asparagus shippers say the season will be short this year, owing to cool weather holding back the crop.

The chamber of commerce of Colusa is offering prize for best suggestion of more suitable name for "Foxtail Park."

The spring harvested rice from the Willows district went out at the rate of 50,000 bags during the first ten days of April.

The Glenn County farm bureau lumber mills will not operate this season because of the uncertainty of building operations.

The Natoma Rice Milling Company has been exonerated by grand jury of charges of selling rice without authorization.

Manager Nagle of the California Fruit Exchange estimates shipment of 40,000 cars of deciduous fruits from the state in 1921.

The Durham Dairymen's Association has installed a 3,000 pound electric separator and clarifier, and a cooling and cold storage plant.

Six weeks courses for agricultural teachers will be given this summer by the state university at Berkeley. June 20-July 30 are the dates.

The special committee appointed by the Pacific Rice Growers Association to investigate as to the crop marketing situation, has just published its findings in bulletin form.

The California Bean Growers Association has marketed 22,000 sacks of Small White beans of the 1921 crop through the American Relief Administration. The beans were shipped direct to Europe.

The California Bean Growers Journal urges all bean planters to carefully hand pick all seed beans so that the grade will not be cut down for percentage of "other beans" showing up in the harvest.

Fruit growers of Nevada County report excellent prospects for fruit up to this time, no damage apparently having been suffered. The cool, cloudy weather of March, with the heavy rainfalls, has been very favorable

Farmer employers of Tehama County have fixed a farm wage schedule: Day labor, $3.50 per day, without board; man and team of horses, $6.50 per day, without board; man and four horses, $9.50 per day, without board.

An ordinance designed to guard against the importing of foul brood into Butte County has been passed by the supervisors. It carries a minimum penalty of $50 for bringing bees into Butte County without the inspection provided for under the ordinance.

Central California

The delta section has marketed 1,800 carloads of celery.

Some 2,100 acres have been planted to new vineyards in Tulare County.

Stanislaus County Farmers Union banquet at Turlock last week seated 150.

Shippers of Valencias are generally holding back fruit to make sure of good market.

The Santa Cruz County farm bureau will hold its annual picnic on May 14 at New Brighton.

The Stanislaus County Poultrymen's Association will hold a show December 4-7 at the Winter Garden.

Cotton growers of the San Joaquin Valley are discussing affiliation with the Arizona-American-Egyptian Association.

It is expected that at least 30 floats will be entered in the big historical pageant of the Raisin Festival, April 29 and 30.

Tulare County has a new truck ordinance requiring permits before moving loads of more than ten tons over the highways.

The Corralitos farm center of Santa Cruz County is discussing the advantages of forming a farmers mutual insurance company.

It is expected that planting of cantaloupes in the Turlock district will be about 6,500 acres this year as against 7,500 last year.

The California Peach and Fig Growers Association is drawing up plans for a new plant at Dinuba, to cost between $60,000 and $70,000.

Following recent meeting of cotton growers at Fresno it was estimated that between 10,000 and 12,000 bales of cotton are stored in the valley.

The proposed trip of the agricultural legislative committee to the land settlement at Delhi has been postponed because of heavy work of the committee.

Kern County farm center meetings at Mountain View, April 18; Pond, 20; Inyo-Kern, 21; Rosedale, 22; Shafter, 27; Arvin, 29; board of directors at Bakersfield, 30.

Cotton growers of the San Joaquin Valley met in Bakersfield, April 5, to arrange for grading all cotton now held in Valley gins and decide as to forming a pool for its sale.

Farm home department meetings in Kern County at Bakersfield, Saturday, April 16; Beardsley-Rosedale, 18; Weed Patch-Arvin-Mountain View, 19; Inyo-Kern, 22; McFarland, 25; Rio Bravo-Wasco-Shafter, 28; Edison-Fairfax, 29.

The Pajaro Valley farmers have adopted a new wage scale. The scale for common labor and for thinning was raised from 35 cents to 40 cents. The rate for man and team of two horses was advanced to 75 cents per hour, and for man and four horse team to $1 per hour.

The Santa Cruz County farm bureau has adopted the following schedule for farm labor: General farm labor, 35 cents an hour; man and team, 75 cents an hour; man and four horses, $1 an hour; hire of two horses, 30 cents an hour; teamsters, 40 cents an hour; tractor drivers, 60 cents an hour; spraying, 40 cents an hour; thinning fruit, 35 cents an hour; milkers, $60 and board; other help, $60 and board.

Southern California

A new cottonseed oil mill is proposed for Imperial.

California Valencia Orange Show at Anaheim, May 17-22.

Beaumont and Banning orchardists report no damage from the recent cold weather.

Elsinore entertains the Associated Chambers of Commerce of Riverside County on April 19.

Mrs. Gwyn Thurmond of Saticoy will have charge of the women's department at the Ventura County fair this fall.

A new steamship service has been inaugurated between Santa Barbara and Los Angeles, touching at Ventura and Hueneme.

Karl Kelsey and Ernest Galwas tied for first place in the Glenavon pig feeding contest in the Riverside County farm bureau.

The Pine Flat irrigation project is being supported in the legislature by cooperating irrigation interests of the San Joaquin Valley.

B. D. Irvine of Brawley has been elected president of the Imperial County farm bureau. Mike Liebert of Seeley is vice-president.

Two carloads of La Habra lemons were part of the freight of the steamship Governor which was sunk in the Straits of Juan de Fuca.

A demonstration of gas tight fumigation tents was given at Corona last week. It was attended by citrus men from neighboring sections.

One hundred and eighty tons of Santa Paula grown beans were sent last week by boat to San Pedro and transshipped to Eastern ports.

There is some agitation to endeavor to keep the Palo Verde Valley of Riverside County free of tuberculosis by placing quarantine restrictions.

An egg bill is now before the state legislature that will require importers as well as jobbers and retailers of Chinese eggs to advertise them as such.

The next meeting of the California citrus institute will be held at Whittier, at some date between June 20 and 30, announcement to be made later by President Barrett.

Shipping of citrus fruits in paper cartons has been successfully tried out by the National Orange Company at Riverside. The trial shipment was of 900 boxes to New York.

Manager Churchill of the California Lima Bean Growers Association says that if rains do not come this season's planting to Lima beans will be even smaller than now appears.

"The one man farm" campaign is being pushed in Imperial Valley by chambers of commerce and others interested in bringing farmers of experience into the valley as home makers.

The annual convention of the California Association of Nurserymen is to be held October 20-22 at Exposition Park, Los Angeles, and a large horticultural and flower show is being planned.

A large delegation of Orange County people interested in water problems visited the conservation grounds of the waters of the Santa Ana in Santa Ana canyon. A party of 100 inspected the work of the Tri-Counties Conservation Committee.

The Coast and General

Thurston County, Washington, has 250 acres of loganberries.

State Entomologist Don C. Mote of Arizona has been appointed state bee inspector.

Production of cotton last year in Arizona, according to the reports of the census bureau, was 104,853 bales.

Governor Campbell of Arizona has requested President Harding to place embargo on long staple cotton as well as certain other agricultural products common to the Southwestern states.

Cotton growers in the Salt River Valley are making rapid progress in organizing the Cooperative Marketing Association. Meetings are being held throughout the cotton growing districts.

A boys pig club has been formed in Chandler, Arizona. The banks of Chandler are financing the members and a breeder near by is making a special price to members. It is expected that about 40 boys will join the club.

Boundary lines between Navajo and Coconino Counties, Arizona, are being surveyed to settle misunderstandings that have arisen between cattlemen as to the exact location of their ranges. The boundary is approximately 200 miles long.

Cattle shipped out of Arizona last year numbered 178,303, cattle slaughtered, 80,896. The report of the livestock sanitary board indicates that the number of cattle shipped and slaughtered last year was just a little more than half the number shipped and slaughtered the year before.

One cotton buyer in the Salt River Valley of Arizona is offering 20 cents a pound for Long Staple cotton. Farmers are disposed to hold indefinitely rather than sacrifice at this price, but as this is the first definite offer for some time it is taken as an encouraging sign of better market conditions.

A representative of the federal bureau of animal industry and the Arizona state veterinarian are planning a campaign for the eradication of tuberculosis. An appropriation has been made by the state for beginning the work, and it is the belief of those in charge that tuberculosis may be prevented and any existing cases stamped out.

Acreage of cotton under the Salt River Valley project this year will be 66,500, according to estimates carefully compiled from zanjeros' reports. This is approximately the same as in 1919 and about 40 per cent of the acreage of 1920. The alfalfa acreage will increase from a little over 25,000 to more than 42,000. The acreage of grain will be considerably greater than last year.

Considerable cotton in the Salt River Valley of Arizona will be "volunteered" this year. This method of cotton growing has but few advocates in normal years. The stand is not as good; flowering and fruiting are likely to be early, exposing the young boll to the extreme heat, and the quality of the fiber is not likely to be as good. The cost of plowing and planting fields is so great that in spite of the drawbacks there is likely to be a considerable acreage of cotton volunteered from the last year's stalks.

Federal Quarantine---Is It Worth While?

By C. L. Marlatt

To California belongs the honor of being the heartiest supporter of the federal quarantine, in fact, I think we can claim still more and say that to this state belongs the honor of initiating the entire movement which is protecting the country from some of the pests which had not secured entrance before the establishment of the quarantine. To this end our state department of agriculture, through its quarantine division, is affiliating with, even working under the direction of C. L. Marlatt, head of the quarantine division of the U. S. department of agriculture. The work in California was started a score of years ago by Alexander Craw. It has been continued by Ehrhorn, Bremner, Maskew and Strong. Mr. Maskew rendered many years of service in charge of state quarantine work. He retired only a few months ago and D. B. Mackie has been in charge of state work since that time. The San Francisco branch has, however, been directly under the supervision of Lee A. Strong. Los Angeles harbor quarantine work is supervised by A. C. Fleury while the San Diego work is in charge of L. E. French. In view of the fact that the importers are making continual effort to discredit the federal quarantine we are glad to give the following statement written by C. L. Marlatt, chairman, federal horticultural board.—Editor.

ANY law or regulation which restricts freedom of action on the part of the individual necessarily has enemies. Federal and state plant quarantine legislation aiming to protect this country from new important plant pests is not an exception to this rule. Just now Federal Quarantine No. 37, which restricts the entry of foreign plants to prevent such entry of pests is being unjustly criticized by a few persons who would like to see this quarantine abolished or amended so that in large measure the old time free importation of foreign nursery stock and other plants could be resumed with all its attendant dangers. It would hardly be worth while to pay attention to these criticisms except that they absolutely misrepresent the quarantine and have been widely circularized through a fairly active propaganda and unfortunately have been accepted at face value by many plant amateurs and societies of such amateurs. Such persons and societies, from lack of acquaintance with the quarantine and its workings, have thus obtained a very erroneous idea of the actual restrictions now being enforced on the entry of foreign plants. The agricultural and horticultural and nursery interests of this country appreciate the need for this quarantine and understand the provisions limiting plant importations. But for the information of plant amateurs throughout the country and of amateur horticultural and garden societies, etc., it seems desirable to issue a statement of facts in relation to Quarantine 37, indicating the provisions which are made under it for the importation either free or under restriction of any plant whatsoever for which a necessity can be shown and to correct the more important of the misrepresentations which have gained acceptance in some quarters through lack of accurate information about the quarantine.

Plant Entry Provided

With respect to possibilities of plant importations under Quarantine No. 37, amateur societies and plant lovers have a right to be concerned by such statements as the following, taken from this propaganda:

The department of agriculture has inaugurated "a policy that would gradually result in the exclusion of all foreign nursery stock and florists' stock"; "a Chinese wall policy for America" which will exclude "other plants which may be discovered anywhere as valuable to us as have been the apple, the lilac, the peach, and countless other familiar but exotic plants in use today"; and "the extension of the present system of exclusion by regulation under a blanket law will undoubtedly result in a total embargo against further horticultural progress in the United States!"

What are the facts as to restrictions on plant importations? No plants are absolutely prohibited entry into the United States under Quarantine No. 37 or under any other federal plant quarantine! Ample provision has been made for the importation into the United States of any plant whatsoever, whether for introduction, experimental, scientific, or other purpose. The department has no wish or intention now or at any time to make it impossible to provide for the entry under proper safeguard of any plant for which a reasonable need can be indicated.

Entry Regulations

1. Unlimited entry is possible without permit or other restriction of field, vegetable and flower seeds, and of fruit, vegetables, cereals and other plant products imported for medicinal, food, or manufacturing purposes.

2. Unlimited entry is possible under permit of from 80 to 90 per cent of the bulbs hitherto imported; of all stocks, cuttings, scions and buds of fruits; the important rose stocks, and all seeds of fruit and forest trees and of ornamental plants and shrubs, including hardy perennial plants.

3. Entry, limited only by legitimate needs, of all other plants is provided for under special permit for the purpose of keeping the country supplied with any new variety or any necessary propagating stock.

4. The exceptions to these paragraphs are those involved under specific quarantines, as, for example, the quarantines relative to citrus plants, bamboo, banana, etc., but any plants prohibited entry under such quarantines may be imported by or through the United States department of agriculture, for any necessary experimental, scientific or introduction purposes.

The classification of plants above given includes all plants and seeds whatsoever for propagation or other uses, and indicates clearly the purpose of the department and the provisions of the quarantine to provide for the entry now and hereafter of any necessary or useful plant, and in quantities sufficient to meet any reasonable need.

How Plants May Be Imported

It is not necessary to consider the importation which is unlimited as to quantity and practically unrestricted of the plants and seeds in the first two groups of plants as classified above. The third group of plants in this classification includes all ornamentals and other plants not included in groups 1 and 2 and it is the restrictions on importations of this group that are objected to in this propaganda. As already indicated, provision is made under the quarantine for the importation of any of these plants under special permits, the only limitation being the showing of the necessity for their importation to supply stocks of any new plants or of any old plants not now commercially available in the United States, for the purpose of establishing reproduction plantings which may ultimately make this country independent of further foreign supplies. No restrictions are placed on the sale of any plants produced from such imported stock except that the importer will be expected to maintain a sufficient supply to meet his continuing needs. Special permits for such importations are issued to any and all applicants who agree to the conditions of the permits and will be continued to be issued with respect to any plant until the department of agriculture is convinced that adequate stocks are commercially available in the United States.

Experts Pass on Special Permits

With respect to any request for a special permit, the determination whether the plants requested are either new or are commercially unavailable in the United States is made by a committee of experts appointed by the chief of the bureau of plant industry of the department — men therefore who are thoroughly acquainted with the subject. In addition, the recommendation of this committee before being returned to the board receives the approval of the chief of that bureau. With respect to such permits, furthermore, the department recognizes that plants may be common throughout the country and yet not available commercially and for such plants also special permits will be issued. Undoubtedly some errors have been made in refusing permits, but on proper presentation of evidence the permits in question have been issued. There may also have been some lack of uniformity at the outset before an adequate system of records and control was worked out, but under the existing system action should be uniform. The board, however, will give careful consideration to evidence with respect to any permit which would warrant its issuance even over the recommendation of the experts of the bureau of plant industry. The board's own function with respect to such permits is to insure uniformity and to enforce the conditions embodied in the permits.

The requirement of a bond in connection with such special permits has been objected to in a few instances. It developed that such bonding of permittees was a necessary requirement. The mere promise of a few importers at least was apparently not sufficient and at the outset plants imported under special permits for the purpose of propagation were in some instances promptly sold in violation of the permit. The bond seems to be the only means of insuring full compliance with the permit and unfortunately it is a burden which must fall on all alike. The bond employed, however, is the one which has been long used in the customs service for similar purposes and has not proved any serious bar to plant importations, as evidenced by the special permits already issued and the importations made thereunder, discussed below.

Importations of "Prohibited Plants"

The records of actual importations of this class of so-called "prohibited plants" makes a very informing statement with respect to the charges of "total plant exclusion," "Chinese wall," etc. The records of the department indicate that since the promulgation of this quarantine some 650 permits have been issued for the entry of those so-called "prohibited plants." The plants authorized entry in these permits include bulbs, ornamentals, roses, orchids, herbaceous plants, etc., to a total of upwards of sixteen million plants. The bulk of these is naturally represented by bulbs and bulblets which must be secured in large quantities for adequate reproduction purposes, but the permits also include several hundred thousand ornamentals. Altogether these permits include authority for the entry of 5,000 different varieties of plants out of some 5,500 covered in the requests received; in other words, ten out of 11 of the plant varieties requested have been authorized entry. These special permits are valid or may be extended until the plants authorized have been secured and entered and many of them are still in force. The "prohibited plants" thus imported are now being grown in hundreds of establishments in some 25 different states and also in the District of Columbia. This new plant production development should within a few years make us independent of much of the stock which was formerly secured abroad and will build up horticulture and floriculture in this country in the most constructive and permanent way, and, at the same time, accomplish the object of the quarantine, namely, to very materially lessen the danger which has hitherto been a continuing and heavy one, of entry of new destructive plant pests. This does not look like an "embargo" or a "Chinese wall plant policy for America!"

Functions of Board Misunderstood

There seems to be a general misapprehension with respect to the functions of the federal horticultural board in relation to this and other quarantines promulgated by the department of agriculture. This point of view is voiced in the propaganda referred to in such expressions as "The horticultural board is the controller of the horticultural research and commerce"; "Permits issued or denied arbitrarily"; "The official acting for the federal horticultural board determines the quantity of any plants which in his wishes it is proper to admit"; "The present federal horticultural board is composed of plant pathologists and entomologists and has neither knowledge of nor interest in the development of the garden art and all that it means to America"; "There is no reason why five men, none of whom is a horticulturist, should have power of life and death over the florists and nurserymen of this country, a power prohibiting millions of amateur gardeners from growing the plants which they desire," etc.

POMELOS FROM ISLE OF PINES

A consular report for March, 1921, states: "The late crop of pomelos is also being shipped to the United States in large quantities. The shipping season lasts from the middle of January to the end of April. In January and February, 1921, there were 15,144 crates of pomelos shipped to the United States, with an invoice value of $54,286, as compared with 8,966 crates, valued at $30,725, for the corresponding months of 1920.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

"Figuratively speaking," the cover is wonderfully interesting. These are days of figures and tabulated statements which make possible comparison of present production with that of former years. The farmer numbers his livestock and figures up his stored away crops as well as his bank account in order to know wherein he is succeeding or failing. The merchant or the manufacturer likewise keeps close tab on his invoice. The federal government must know as often at least as once in ten years wherein it is gaining and wherein it is losing. One little corner of the census bureau's activities is exhibited on the cover. Our crops are chronicled in acreage, in billions of pounds or bushels, or hundreds of millions of tons. As a rule, there has been a wonderful increase the country over.

* * *

And we are all jealous of our own figures, especially we Californians. A couple of weeks ago we gave figures which had been forwarded from the census bureau as to 14 selected counties in the United States. From these it appears that a California county is to be granted highest honor in crop production in the United States. There are, however, other California counties which feel that they are producing even more than some of the counties so far reported by the census. As soon as the figures as to these counties are received the Cultivator will give them the same prominence on the cover as those which have already been published. For instance, Imperial Valley papers have canvassed the situation and state that Imperial Valley's 1920 crop was far greater than the 1919 crop as reported. San Joaquin, Stanislaus, Fresno, and other counties, known to be wonderfully large producers, are also anxiously asking: "Where do we stand?" We will all be patient, and we think the next few days will give a most satisfying answer to California counties.

* * *

A bull which would sell for $1,200 would be a pretty good bull. But when we said under the photograph of King Korndyke Pontiac Mead in last week's Cultivator that he was the son of "King Korndyke Pontiac 20th purchased by the Burr Farm for $1,200," we knew better, for K. K. Pontiac 20th was purchased for just ten times that sum. In other words, we dropped off one cipher; $12,000 should have been the price named for that worthy sire.

* * *

San Joaquin Valley users of white coal have been granted a reduction in agricultural service rates by the state railroad commission. The new rates are retroactive and begin with April 1. These rates will materially aid in correcting the injustice which was visited upon farmers by the rates which prevailed during last season.

* * *

Assembly Bill No. 945, "an act regulating the use, construction and maintenance of the public highways, etc.," practically repeals, if passed, former enactments regulating use of highways and provisions having to do with registration, identification and equipment of vehicles and provides new regulations, also new registration fee, penalties for violations, etc. The bill has been read, sent to the printer and is in committee, and, as a rule, the automobile and highway people are anxious to see it out, passed and signed. It is a good bill and should be passed.

* * *

The April issue of the Monthly Bulletin of the California department of agriculture is a special pest control number. The reports of the state convention and of the commissioners have been given in former numbers and now there will be opportunity for more of cultural material. Harry Smith touches upon biological control; Professor Babcock, bud selection; Professor Essig, economic insects; Prof. T. Francis Hunt, brown rot; Donald D. Penny, horticultural commissioner of Santa Cruz County, a skin-feeding tortricid of the apple; D. B. Mackie, observations on Arizona authorities in connection with thurberia weevil; and Prof. Baker of Washington, rice aphids.

THE MESSAGE

Congress is in session; the president read his message; and the country generally approves. It is possible the message may not live as a classic in literature, but it is filled with common sense suggestions as to the needs of the country. Perhaps one sentence expressing more of the general trend of the message than any other is: "More business in government; less government in business." Harding takes stand emphatically opposing government ownership. He insists we must have a greater merchant marine but that it shall be secured through encouraging private capital rather than by public ownership.

He takes definite stand against endorsement of the League of Nations but does express the hope that an association of the great powers may be secured which will lead to a permanent peace.

SAVING THE SEQUOIAS

Many loyal Californians, appreciating our wonderful heritage in the sequoias, the oldest living things on this earth, have appealed to state and federal governments for aid in saving for future generations a few of these valuable trees. Now comes assistance from another great force, and outside of our own state, the National Geographic Society. President Gilbert Grosvenor writes regarding that society's effort to secure the purchase and presentation to the United States government of 1,276 acres in the Sequoia National Park. In addition President Grosvenor writes:

"The society, furthermore, holds options upon and expects shortly to purchase and cede to the government 640 acres of sugar pine, yellow pine and fir in this park, which constitute the approach to the Sequoia groves. For this new project, public spirited members without solicitation have placed $40,000 at the disposal of the society. The additional $5,000 required was appropriated by the society from its funds at the February meeting of the board of trustees. This brings the total contribution of the society to $25,000 and of members to $61,330, and the area saved to 1,916 acres."

Membership in this society costs but $3.50 per year, and one of the privileges is the receipt of the National Geographic Magazine.

RAISIN MARKET SLUGGISH

During the past few weeks the raisin market has been sluggish, and as soon as the outcome of the contract campaign was definitely known the Associated wired to the trade in the east in part as follows: "Owing to exaggerated statements of stocks on hand and reports that growers were not freely signing contracts the raisin market has not been active in the last 60 days, but with assurance that this success gives, the hand to mouth method of buying should be discontinued as you can now place your orders with confidence that you will at least make a reasonable profit on the turnover. We have on hand today sold and unsold of all varieties of raisins and dried grapes 52,000 tons, which is 25 per cent of the 1920 crop. with seven months before the new crop can reach the markets."

COLLEGE APPROPRIATIONS

It seems that the many suggestions made regarding the college of agriculture; its remaining at Berkeley, its removal from Berkeley, the establishment of branches, etc., will not be carried out during the present session of the legislature. There will be a committee consisting of three farmers, one each from Northern, Central and Southern California, one college of agriculture professor, a senator, an assemblyman, and the comptroller of the university. This committee will investigate the work of the university and its needs and recommend to the next legislature, which will convene in 1923, the best steps to take to establish a permanent and a great agricultural educational institution. This brings before the legislature now in session the question as to maintenance and immediately needed improvements.

For maintenance of the college of agriculture, including $50,000 for deciduous fruit experiment station work, it is now recommended that the legislature shall appropriate $2,050,000, but owing to the rapid growth and the great demands on the college additional buildings and equipment are needed on the farm at Davis which will cost $450,000 more. Hence the agricultural legislative committee and other forces are now working to secure an appropriation aggregating an even $2,500,000.

RACE PROBLEMS

In making an address on immigration and race problems in Galveston, Texas, Prof. Conklin of Princeton remarked: "The greatest danger from immigration of European races is from inherited mental and moral defects, since bodily defects are more easily detected and eliminated. The army mental tests should be applied to all immigrants and all of inferior mentality should be excluded. Freedom from criminal tendencies should be determined in their old homes before they start for America. Immigration of colored races should be prevented as far as possible. Within 200 years our country will be fully populated. Let us not curse our children to the latest generations by serious race problems in order that we may 'get rich quick.'"

Californians are discussing the importance of immigration from a standpoint other than our power of assimilation—or its lack—of European peoples and are doing some serious thinking. As Carlyle says: "So soon as men get to discuss the importance of a thing, they do infallibly set about arranging it, facilitating it, forwarding it, and rest not till in some approximate degree they have accomplished it." Perhaps Easterners may now have the situation visualized so they may to a degree aid us in accomplishing that which will be best for the whole country. It must be understood that the mere securing of cheaper production for a few years or of using labor which may be wonderfully convenient at the present time should not be allowed to blind us to the fact that the heritage of our children is jeopardized.

WHAT DO THEY MEAN?

Eastern industrialists, financiers and others are seriously concerned over the gathering in Washington at the same time that congress convenes "of representatives of the organized farmers of the United States." The alarming statement is made that these organizations "include more farmers than were ever associated together in any formal group of farmers in the history of agriculture in this or any other country, or in all the world together." "Five of these eight great organizations include a membership of between three and four million." "A political power of not less than 5,000,000 voters." That "political power" stuff is exactly what hurts, hence pages in a magazine published in Washington asking why these presumptuous people are there demanding protection which other people of the entire nation must be taxed to provide. "In a democracy no class can be taxed for the benefit of another class." "These farmers should not be permitted to increase their profits, curtail supply, fix prices, or otherwise secure advantage at the expense of the rest of the people." "The taxpayers money must be turned back into proper channels, the effort at class domination of commodity marketing must cease, etc."

Well, it's too bad if we have to stand on other people's corns, but we must stand. We have long endured injustice. It is wonderfully shocking to be touching elbows. But "what in the deuce do they mean?"

Is the Pruning of Citrus Trees Necessary or Desirable?

By Robert W. Hodgson

THERE is little need of emphasizing to the average citrus grower the necessity for reducing production costs to the absolute minimum. The unsatisfactory returns of the past year have automatically caused citrus growers everywhere to come to a rather keen realization of this necessity. Agitation tending toward reduction in wages, the result of which has been the recommendation of a standard wage scale in certain citrus districts, clearly points toward the recognition of the necessity for reducing costs of production. Growers are everywhere studying their cultural operations and debating as to what are the essentials and what may be safely eliminated. Fertilization programs are being examined with considerably closer attention than has been the case for many years.

A marked tendency toward the discontinuance of pruning is being shown in many districts, a tendency, however, which has as its basis an additional factor entirely aside from the economic situation. During the past year a number of articles have appeared in the agricultural journals of Southern California the inference from which might be that the practice of pruning is undesirable and may safely be dispensed with. The data which have been submitted and upon which this inference is based have to do purely with the yields obtained, it having been rather conclusively shown that any pruning whatever results in a decreased yield of fruit and the more severe the pruning the greater the decrease.

There are pruners here and there, however, as well as orchardists and students of citriculture, who do not feel that, simply because pruning has been found to result in a decrease in yield, it should be discontinued altogether. The writer holds this same viewpoint. And there are many growers who are in considerable confusion and uncertainty regarding the whole practice. If pruning is undesirable they are most anxious to discontinue it on account of the expense incurred. On the other hand, if pruning is necessary and desirable this is the best time to do a thorough job, since the crop is not worth as much as under ordinary circumstances.

Pruning a Devitalizing Process

Plant physiologists have long recognized that any sort of pruning whatever is devitalizing to the tree and the more severe the treatment the greater the reduction in vigor. The fundamental conception of pruning is that of a change in environment. The taking off of any of the above-ground parts of the tree simply results in decreasing its available food supply and in proportion to the amount of growth removed. With trees in foliage and of course with evergreens, the effect of pruning is all the more severe since it means the removal of actively functioning leaf surface which must be renewed before the tree is in a position to again receive its normal food supply. Elaborate pruning investigations have in every case shown this to be true, the unpruned tree in all instances having been found to be larger and stronger in every way than the pruned trees. Consequently a reduction in crop is most naturally to be expected as a result of pruning and particularly following severe treatment.

Deciduous fruit growers have long recognized that pruning is not done primarily to increase fruit production, although rational pruning treatment following severe heading back has been found to actually result in more fruit, this being the reason for the phenomenal results attending the use of the new "long" system of pruning. The unpruned trees, however, have been found to produce more fruit, although of somewhat inferior quality, particularly in point of size.

Why Prune?

The question then naturally arises as to what reasons there are to justify the practice of citrus pruning and which make it necessary for citrus trees to receive pruning treatment. The first of these which entirely justifies a reasonable amount of pruning for citrus trees is the fact that under favorable conditions, if unpruned, both orange and lemon trees may become too large for economical handling. Every grower recognizes the great disparity in costs of fumigation and spraying in the case of large trees as compared to medium size or small trees. Fumigation and spraying costs today are among the most important factors in production costs. The cost of gathering the fruit under present market conditions and labor costs has become practically prohibitive, ranging with lemons from 30 to 90 cents a box during the past season. No one will deny that it costs considerably more to gather fruit from a large tree than from a small one, particularly when it must be clipped carefully and handled as is necessary in the case of citrus fruits.

Years ago the Baronio system of pruning the lemon was in use in certain districts. It consisted of keeping the trees small so that all the fruit could be gathered from the ground. It was succeeded by the topping or hedge system, which consisted in brief of shearing off all growth above an arbitrarily selected height. Both of these systems clearly reflected the fact recognized by citrus growers for years that it frequently does not pay to gather fruit from large trees. The tree of medium size is the most economical to handle, costing less to fumigate, spray, and harvest the crop than the larger tree.

Moreover, it is possible by judicious pruning to grow more fruit on a medium sized tree where it is distributed from the outer shell of foliage clear in to the center than on a large tree which bears only shell fruit. Citrus trees if unpruned invariably become so dense as to lose the fruiting habit in the center of the tree. For fruiting there must be penetration of sunlight, since the carbohydrates stored up in the tree and which serve as its food supply are manufactured in the leaves and only when exposed to sunlight. For this reason alone—that of securing fruit on the inner parts of the tree—the pruning of citrus trees is justified and necessary.

Every citrus grower recognizes that in his trees there may be found different types of growth and that these differ markedly in their ability to compete with each other. The sucker, if

Identify the Gill One-piece Piston Ring by the joint, but do not measure its merit by the joint *alone.*

Gill Service is nation wide. There are more than 2,000 stocks of Gill Piston Rings in the country. Some one of these dealers is located near you to supply you with whatever size you may want and the number you want *when* you want them. If your garage or repairman or accessory dealer doesn't happen to carry Gill One-piece Piston Rings tell him to get them from his jobber or from the nearest of our 39 Branch Offices.

Sulphur Time in Vineyards

By Fred K. Howard

SULPHUR your vineyard now. The use of sulphur on grape vines for the prevention of mildew is one of the necessary operations incident to the production of a profitable crop of grapes regardless of whether these grapes are to be used for shipment to the Eastern markets or dried into raisins. Mildew is one of the most serious diseases of grapes in California, and this is probably the easiest disease to control if the proper methods are used.

Sulphur Early

There are two essentials to remember in controlling mildew. First, start sulphuring early; second, thoroughly distribute sulphur. Many growers have failed to get results from the use of sulphur because they did not observe these two essential points.

Mildew is much more easily prevented than controlled, therefore the first application of sulphur must be made when the young, tender shoots of the vine are not more than eight inches in length. If the sulphur is applied at this time, and applied thoroughly, it requires only a small amount to do the work, while if the application is delayed until there is more foliage, and consequently more chance for mildew infection, then the sulphur requirements are relatively higher. It matters little, however, how early the first application is made, or when the second or third applications are made, if the proper distribution is not secured. It is not sufficient to throw a handful of sulphur around the crown of the vine. The fumes, whatever their nature may be, are not effective on the growing portion of the mildew for any gerat distance and, in fact, it has been authoritatively stated that sulphur on one leaf has very little or no effect on the mildew of another leaf. Further than this the few unsulphured vines, or parts of vines, in a vineyard are the source of infection for the balance, regardless of how well sulphur may have been applied earlier in the season. For this reason the use of burlap sacks and tin shakers should be condemned. The expense of a satisfactory knapsack sulphur machine is not very great when considering the returns one gets from the investment, and, if the acreage is large, a power machine which will do the work rapidly is not out of place.

Uniform Distribution Essential

A slogan for the man who wishes to control mildew satisfactorily is, "Distribute the sulphur in such a manner that there will be some on every leaf of every vine in the vineyard." The sulphur used should be either the best grades of sublimed sulphur or very finely ground sulphur. When examining material before purchasing, if upon rubbing between the thumb and finger there are gritty particles felt, the material should be discarded. Good dusting sulphur should be as fine and as smooth as talcum powder. These small particles will float in the air and adhere to the under as well as the upper surfaces of the leaves, while coarse particles will fall to the ground and be of little use so far as mildew control is concerned.

The time of the day for sulphuring matters very little provided there is no wind. For the comfort of the man operating the machine, as well as for effective distribution, there should be as little wind as possible. For this reason most of the sulphuring is done during the early morning hours. At this time there is also a slight amount of moisture on the leaves which helps to make the sulphur stick. Too much moisture, however, is detrimental, since it tends to collect in drops and concentrate the fine particles of sulphur in patches.

The Heart of the International 8-16

WHEN you buy a tractor, be sure that it has a good "heart"—an engine that will deliver steady, uniform power at low cost and that will stand up under continuous service, regardless of operating conditions.

The heart of the **International 8-16 Kerosene Tractor** is a powerful well-balanced mechanism that has every feature essential to the kind of service for which it was designed. It is a vertical four-cylinder engine of the valve-in-head construction, which has been found to be the most economical for farm use. All working parts are enclosed as protection against dust and dirt, and the engine itself is covered by a snug, tight hood. Wide bearings; a large, well-made crankshaft; long pistons, each having four rings to insure good compression; removable cylinder liners so that scored cylinders can be renewed at small cost; throttle governor to regulate fuel consumption according to load and maintain uniform speed; kerosene mixer, water air cleaner, dust-and-water-proof high tension magneto—these are some of the features that make up the *powerful, dependable heart* of the **International 8-16 Kerosene Tractor.**

But it isn't only the "heart" of the 8-16 that is built right; every detail of its design and construction, from the quickly adjustable drawbar to the well-placed, wide-face pulley, is made with the same conscientious regard for operating thoroughness—for *satisfactory service to the purchaser.*

See your nearby International dealer in regard to one of these tractors—and write for a catalog.

TOPWORKING CITRUS

By Ernest Braunton

THE agricultural extension service, in cooperation with the bud selection department of the Fruit Growers Supply Company, has been holding a series of citrus top working demonstrations throughout Los Angeles County, the first being held on the W. A. Jones place near Azusa.

Farm Adviser Hodgson opened the meeting with a plea for recording yield of every individual tree in the orchard. He quoted the record recently obtained in an orchard near Highland, San Bernardino County. There are 1,525 trees 16 years old, planted 90 to the acre. The yield per tree ranged from nothing to 326 pounds, not a good yield for trees of such age. It was found that it required an average yield per tree of 150 pounds to pay all expenses. Of the lot 490 trees, or 32 per cent, yielded less than 150 pounds per tree. Of the remainder 646 trees, or 42 per cent, "broke even" or just allowed the drones and themselves, or 74 per cent, to pay their own expenses. This left 389 trees, or 26 per cent, to bring profit to the owner. By top working all below a certain yield, budding from the trees of best yield, all could be made profitable.

C. S. Milliken of the Fruit Growers Supply Company next spoke on the same subject, stating that while he was not advocating the top working of high grade lemon orchards, where trees are vigorous and crops not of highest quality it may be a good move, for we are confronted by these facts: California has 33,000 acres of bearing lemons, yielding a crop equal to the amount consumed in the United States. In addition there are 17,000 acres too young to bear and which are fully as promising as the older orchards, as we today know better where lemons should be planted. In the foothills from Pasadena to Highlands top working to other citrus trees, on lemon trunks, has proven very satisfactory. In some other districts the change has not been satisfactory, but the cause has not been determined. It may be temperature, climate, soil, treatment of orchard, or a combination of all these, Mr. Milliken not wishing to commit himself to an opinion without further study.

Perry Hill, foreman of the nursery of the supply company, and an expert authority on budding, then cut away the top of one of Mr. Jones' non-producing orange trees and placed several buds, showing the entire process in detail.

TREE BABIES

By Charles H. Shinn

It has been a glorious winter and spring. Never did outdoor California look more beautiful. Some two millions of people are beginning to think about the coming days of recreation, the climbs, the camps, the forests, the lakes and streams, the wild life of every sort. By the time this reaches print the exodus will be well under way; our forests and mountains are ready to welcome all of you.

Of course everyone finds in print, told in a thousand earnest ways, the good old rules about fire prevention and how to make, care for and clean up camp. These things simply have to be said and taught to young and old over and over again with every possible emphasis and improvement.

But we do seriously doubt whether many campers realize that for one mature tree destroyed by a fire a hundred, a thousand, or even more of the small trees, the babies of the forest world, are swept into nothingness. This item is really the all important one because it involves the whole future of the forest. The careless, selfish heathen who lets a fire start is really a murderer of tree children, and that's mighty bad business.

Again, if campers can only learn how to choose their camping places with full regard not only to convenient wood and water supplies, but also with especial care to avoid settling down in thickets of baby trees, they will deserve well of coming generations. Over and over again the writer of this paragraph has gently suggested to campers in the Sierras that by moving

perhaps 50 feet away the lives of a lot of tree babies would be saved. In every case the suggestion was received in the same spirit and promptly acted upon.

It must be remembered that these tree babies are often less than an inch high, and only one or two years old. One has to look for them with care and know how to recognize them at sight. Let us especially teach that to the children.

SPRAYING APPLES

Farm Advisor Hodgson held a spraying demonstration on April 4 in the apple orchard of H. Koopmann, near Downey, Los Angeles County. The trees were in just the right condition for the first spraying for codling moth.

In his talk, previous to the spraying of several trees by a commercial sprayer, Mr. Hodgson said that when petals are falling plentifully is the proper time for first application of lead arsenate spray. This may be made from either 12 pounds of the paste or six pounds of the powder to 200 gallons of water. Either paste or powder may be obtained at any seed store and also from other sources. The second application should be made ten days or two weeks later, using the same formula. If a second brood appears, as is sometimes the case in late July or early August, spray again, but with a lighter spray, using eight pounds of paste or four pounds of powder to 200 gallons of water. When aphis or scab is present, usually at time of first spraying, add to formula given six gallons of commercial lime-sulphur and one pint of black-leaf 40. Not all varieties of apples may be sprayed at same time as there is quite a range in time of blooming.

PEAR OUTLOOK FOR 1921

Bartlett pears in the river districts are now past the full bloom state, reports Field Entomologist Urbahns of the state department of agriculture. Conditions generally point to the setting of a heavy crop of pears. If favorable weather continues the first spraying for control of the codling moth worms will be in full progress about April 5. Both the powder and the paste forms of lead arsenate will be used in large quantities. Pear growers are planning to make every effort to get the early spray applications thoroughly applied and properly timed since these are of greatest importance in reducing the amount of wormy fruit.

Some of the early varieties of pears have already been sprayed in the river district. In the foothill districts the blossoming of Bartletts appears to be about a week later than in river districts, hence spraying in the foothills should commence about April 10-12 under favorable weather conditions.

MEETING OF AVOCADO ASSOCIATION

The California Avocado Association will hold its annual meeting at the Hotel Maryland, Pasadena, May 6 and 7. There will be an experience meeting on Friday afternoon on the growing of avocados, which is sure to be interesting and instructive, following which a display of fruits will be exhibited which promises to be larger than any yet shown. The usual informal dinner in the Palm Room of the hotel will be followed by speeches by representatives of the various horticultural papers: J. C. Knollin, Orchard and Farm; B B. Street, California Citrograph; C. B. Messenger, California Cultivator; N. L. Chapin, Rural World, and a representative of the Pacific Rural Press.

On Saturday morning papers will be read by H. M. Chace of the U. S. department of agriculture, Los Angeles; Prof. M. E. Jaffa, University of California, Berkeley; Dr. J. Eliot Coit, Los Angeles, and L. W. Albright, Los Angeles.

President William M. Sallmon of Chula Vista will deliver his annual address at the Saturday afternoon session, which will be devoted to a business meeting for members only.

The National Grange is holding a conference in Washington this week and considering national legislation as it affects agriculture. One of the rules of the Grange is that it must remain absolutely out of partisan politics, but plainly it considers the watching of agricultural interests as outside of political activities.

WHAT WILL THE 1921 HARVEST BE?

(Continued from Page 511.)

low lands; otherwise good prospects.
Pears: Of no commercial importance.
Prunes: Prospects fair.
Grapes: Very little injury from frost in this county.

A. L. Rutherford, Horticultural Commissioner, Stanislaus County

Almonds: 100 per cent.
Apples: 90 per cent.
Apricots: 100 per cent.
Cherries: 75 per cent.
Peaches: 95 per cent.
Pears: 80 per cent.
Prunes: 100 per cent.
Grapes: 80 per cent.

E. B. Beeton, Beaumont, Riverside County

In the immediate vicinity of Beaumont there has been very little damage done by the late frosts to deciduous fruits.

Almonds, apples, apricots, peaches have escaped without injury. The later bloom on cherries, pears, prunes and grapes has suffered a loss of from 10 to 15 per cent. Prospect for a normal crop looks favorable at the present writing, April 11.

Aratus Everett, Moorpark, Ventura County

Apples, pears, peaches and prunes are blooming and setting fruit fairly well, but none of these fruits is raised in comemrcial quantities here.

Apricots and walnuts are the only trees we rely on commercially.

There has not been so poor a prospect for apricot crops in 10 or 12 years. Old apricot trees have less than one-tenth of an average crop and many of the younger trees are failures on account of light setting and damage by late frost in coldest districts.

Walnuts are also damaged in some sections, but we hope that later blooming will come out and set. There is no hope of later blooming for apricots.

A. L. Shively, Santa Paula, Ventura County

Apricots: After the effects of the rain and frost the general estimates are 30 to 40 per cent of normal apricot crop for this county.

L. V. Haupt, Horticultural Commissioner, Kings County

Apricots: 100 per cent of normal.
Peaches: 100 per cent of normal.
Prunes: 110 per cent of normal.
Grapes: 100 per cent of normal. No damage to fruit. Slight damage to vines, but not enough to affect crop. This season's planting slightly damaged.

Wm. Gould, Horticultural Commissioner, Yolo County

Almonds: 50 per cent.
Apples: 75 per cent.
Apricots: 40 per cent.
Cherries: 50 per cent.
Peaches: 75 per cent.
Pears: 80 per cent.
Grapes: 70 per cent.

Santa Paula Chronicle, Santa Paula, Ventura County, Edith Bristol

Apricots: Temperature ranging close to 28 degrees from midnight till daylight several days early in April damaged the apricot crop of this district to what the orchardists fear will prove to be a considerable extent. Authorities estimate the loss to the apricot crop at fully 50 per cent. Through some sections of Ventura County, notably the Ojai district, the loss to the apricot crop is estimated even heavier than this.

E. T. Reynolds & Son, Chico, Butte County

Owing to frost damage last week it is impossible now to give you any estimate of the coming fruit crop, including almonds.

Peaches, almonds, prunes, grapes have been seriously injured; just what the prospect is now it is impossible to even estimate with any degree of certainty or value.

It will be ten days before estimate can be made that would be worth considering.

Ernest W. Curtis, Tehama County Agent, Red Bluff

Almonds: No damage noted thus far. Crop heavy.

Apples: Not grown comemrcially except in one section, and no report available.

Apricots: No damage noted. Crop good.

Cherries: No damage. Only one or two commercial orchards.

Peaches: No damage. Crop good.

Pears: No apparent damage.

Prunes: No damage except in hill sections, which constitute very small acreage.

Grapes: Not hardly a commercial crop this year. No damage noted on the few bearing vineyards.

Geo. W. Harney, Horticultural Commissioner, Yuba County

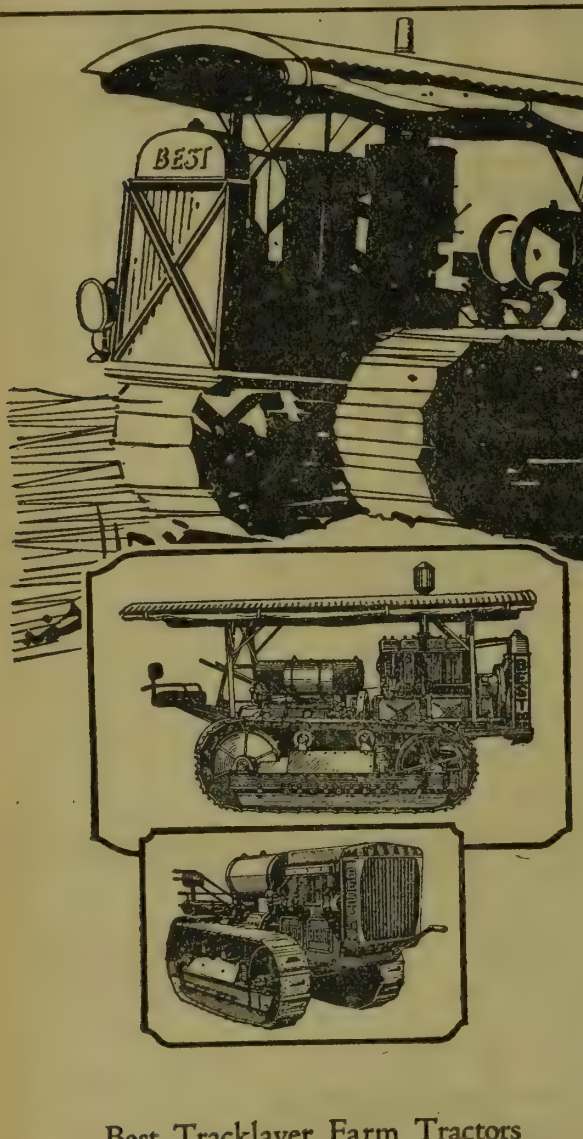
Too early to make report; must wait for few days to get definite line on damage.

Wm. B. Jackson, Ontario, San Bernardino County

Apricots: Less than one-fourth crop.

Peaches: Frozen in spots; and outside of that will be a bumper crop.

Grapes: Can't say. There has been some late pruning and serious frost. Early pruned vines will give good crop.



Best Tracklayer Farm Tractors are built in two models: the Tracklayer "Sixty" and the Tracklayer "Thirty." The lower picture shows the "Thirty." Just above it is the "Sixty."

Tracklayer Tractors are *factory Built*—not assembled. Some of the accessories are bought, but the vital and important parts, including the motor, are built at the Best factory to fit perfectly into the Best proved tractor design.

Cutting the Corners On Farm Costs

THIS year farmers are serious as never before on the question of real constructive farm economy. Corners must be cut—not by skimping and makeshift, but by avoiding waste and unnecessary or duplicating operations, by getting through the usual jobs by the shortest route, by doing them better, quicker, and more thoroughly.

It is true that a *good* tractor is one of the farmer's greatest and most dependable helps in economic farming. Best Tracklayer Tractors, for instance, can be thrown into the fields and orchards at precisely the right time for maximum crop results. Soil preparation will be done in fast, unfaltering time and at the proper depths. The work will be thorough and uniform. You have saved time and money and hired help which is profit. When not in the field the Best can be put at a hundred and one jobs of belt work and save hired help and labor.

Your investment in a Best this season is doubly wise—because of immediate economies effected, and because it covers many years to come without thought of replacement. Best stamina, long-life and low operating cost have been established beyond any doubt.

Write at once for catalogs and full information, and the name of our nearest dealer.

BEST TRACKLAYER TRACTORS

IS THE PRUNING OF CITRUS TREES NECESSARY OR DESIRABLE?

(Continued from Page 515.)

allowed to remain in the tree, invariably wins out in the competition at the expense of the rest of the tree. If citrus trees are unpruned they are very likely to grow up to undesirable and unprofitable types of growth.

Rational System Suggested

Granted, then, that there are very good reasons why citrus trees require a certain amount of pruning, what may be considered a rational system? It seems to the writer that such a system is to be based first upon a knowledge of the different types of growth which may and do occur in citrus trees; second, upon a knowledge of the performance of these types of wood; and third, upon a recognition of differences in tissue efficiency between the different types of growth in the tree. There is little necessity for discussing the different sorts of growth which one may find in a citrus tree. Practically every citrus grower recognizes them, but they may be classed under the general headings of fruit wood and vegetative growth. The work of such investigators as Mr. Shamel, as well as the general experience of hundreds of growers during the past two decades has clearly indicated which of these types are the most satisfactory and consequently those which should be used. Sucker wood and all intermediate sorts are generally agreed upon as being undesirable, which leaves the fruit wood only, from which the tree should be formed. A rational system of citrus pruning, then, seems to be, first, planting trees propagated from the very best selected buds only, together with top working all off-type trees to the best strains; second, rigorously excluding all undesirable types of growth such as sucker wood and intermediate sorts; and third, keeping the trees reasonably open to the penetration of sunlight so as to induce interior fruiting.

There are several practices which investigation and experience clearly demonstrate to be undesirable. One of these is severe pruning of the normal, thrifty citrus tree. It has been celarly proven that severe pruning of healthy citrus trees results in a severe shock and setback. In the first place the bearing surface is materially reduced, which means decreased yields. In the second place the leaf surface is greatly reduced, which means decreased food supply and starvation, and in the third place, the severity of the treatment is certain to result in a forest of undesirable vegetative growth. Severe pruning of old and decadent or weakened trees may, however, be a decided stimulant and very beneficial, since it results in the elimination of inefficient tissue which acts as a drain upon the energies of the tree.

Heading back or stubbing is also to be avoided since it results in vigorous vegetative growth on the part of the trees which must later be cut out. Trees pruned by the system outlined above will produce fruit throughout the entire bearing surface from the outside shell to the center and will yield more fruit from medium sized trees than from much larger and unpruned trees left so dense as to bear all the crop on the outside. In addition, the cost of pruning by this system is about one-third the cost of the pruning given to the average citrus tree.

During the last week or ten days, the agricultural extension service of Los Angeles County has been conducting citrus pruning demonstrations in the various citrus centers demonstrating the above system. In every case, test plots have been laid out together with checks so that the results secured may be witnessed by the growers of the district.

Ranges throughout Arizona have been considerably improved by recent rains, and snows in the higher elevations.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Machine Handling of Grain

AVERY curious thing, in a state which prides itself on its progressiveness in agriculture, is the persistence in California of the old hand work method of storing and shipping grain long after the other grain growing sections of the United States and of the world in general have adopted machine handling. The Middle West and Southwest, Canada, Australia and even South America many years ago installed elevators and other bulk handling equipment, and the farmers of those regions have ever since been reaping the benefits of the modern method in the forms of decreased labor and increased returns from their crops.

Storage on the Farm
Grain bin installed on J. L. Goodwin's ranch at Farmington with simple elevating device erected at cost of $100.

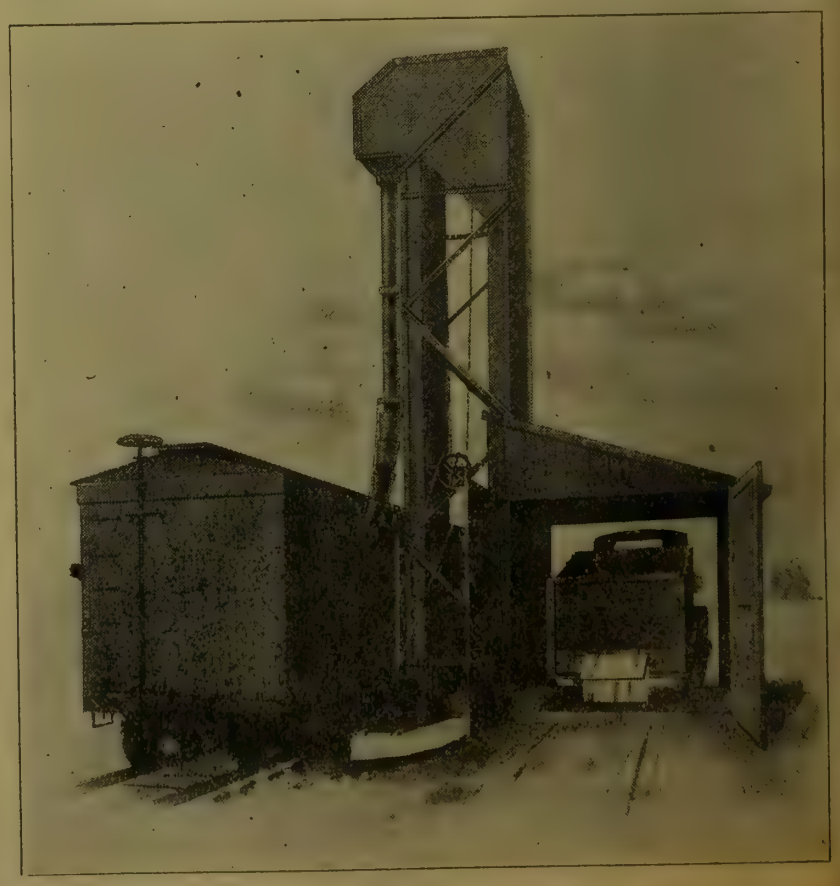
Away back in the forties and fifties of the last century it was found that bulk grain shipped in sailing vessels from San Francisco sometimes gave trouble, in the rough weather encountered in the vicinity of Cape Horn, by shifting its position in the hull and thus endangering ship and cargo. So it became the established custom to harvest and load the grain in sacks. Since that time millions of tons have been tugged and lifted about by main strength and elbow grease (with sack bucks and stevedores getting from $4 to $10 a day) when, by the use of simple machinery and a little gasoline, it could have been conveyed all the way from the harvest field to the flour mill or the holds of the ships without anyone's lifting anything heavier than an oil can or the tailboard of a truck.

Sailing vessels have been replaced by steamships, the Cape Horn trip by the Panama Canal; big users everywhere are equipped to receive and handle bulk grain, and find the sacks a nuisance, and yet until four or five years ago no serious effort was made to provide bulk handling facilities in California and get rid of the extra labor and waste involved in the old system.

And these wastes are very serious. The cost of the sacks, which fluctuates between seven and 27 cents according to the season and the farmer's necessity, is the least important item. Sack sewers, sack jiggers and sack bucks are all performing unnecessary labor, and they all have to be paid and fed. The same is true of most of the men in the warehouses, and, as far as grain is concerned, of the stevedores and other dockhands. Everything that they do can be much better performed by machinery and at a small fraction of the cost. Then there is the spillage of grain in sacking on the harvester, which amounts to little or much according to the skill and care exercised. Some sacks are always torn open in the field by stones or stubs or by being flung down too violently. In the field the squirrels and field mice get in their work, and in the warehouse or wherever sacked grain is stored the rats and mice hold high carnival. They eat some of the grain and spoil more, but the very worst results of their work are the holes they gnaw in the sacks, for from these the contents are spilled and wasted every time the grain is moved. This is probably the biggest waste of all. Often it is necessary to re-sack a whole crop on account of the ravages of rats and mice.

When the grain is harvested in bulk, stored in metal bins or other fireproof and rat proof buildings on the farms, hauled to the railroad in bulk wagons or trucks, put on board the cars by elevator equipment and similarly handled at the terminal or ocean shipping point, all these wastes and losses are reduced to the lowest percentages, and some are abolished altogether.

The California Farm Bureau Federation has made the bulk handling and marketing of grain one of the most important reforms on its program. Since acquiring by lease the 1,200,000 bushel terminal elevator at Oakland with all its facilities for handling, cleaning, storing and conditioning bulk grain, it has been carrying on a campaign to secure the erection of branch elevators of concrete construction at various grain centers throughout the state. Quite a number of these will be built; but it is now evident that the time is too short to have very many in operation in time for the 1921



Low Cost Loading Equipment for Bulk Grain

crop. Therefore the farm bureau is urging its members and grain growers generally to install at the railroad sidings simple and inexpensive bulk loading equipments, without storage capacity but capable of handling from 1,000 to 2,000 bushels per hour from the wagons to the cars. An equipment of this sort can be delivered and set up within three weeks of receipt of order. This has no storage, except for a few truck loads in the concrete pit, and, of course, no cleaning or beard-ing machinery, and this little device will load the cars just as well as an elaborate and expensive structure. Later on storage capacity and any de-sired machinery may be added, or, if a more elaborate structure is erected the elevator may be removed and used for the filling and emptying of the metal grain bins on the farms, in which case the only loss would be the expense of the concrete pit, which is a trifling matter.

For most grain growers metal grain bins or other simple storage buildings on the farms are highly desirable, both for immediate receipt of the bulk of the crop and later on to safely house grain which is kept for feed and for seed. Of course, it is practicable to haul directly from the harvest field to the railroad loading station, but unless a farm is very conveniently located this is likely to make heavy demands on trucks and drivers at the time they are most in demand. Be-sides, it tends to throw most of the grain on the market in the few weeks after the harvest, and this results in congesting the handling facilities and depressing prices.

One after another the bugaboos which were raised against the bulk handling system by those who profit by the old conditions have been dis-solved into thin air. It was said that insurance could not be procured for bulk grain shipped from San Fran-cisco. Lloyds said they would be glad to insure it in that form, and immedi-ately the other companies fell in line. Somebody claimed that English brew-ers and distillers wanted to receive barley in sacks because the beards were not broken off when handled in that way, or something of that sort. Letters from the American consuls at London and Liverpool, and from Dean Hunt, who has while in England been investigating the same matter, declare that these buyers much prefer to re-ceive barley in bulk. It was said that the local buyers would only handle it in sacks, and this is true with re-gard to some of them; but the mar-keting enterprise of the California Farm Bureau Grain Corporation is based on bulk handling; the Sperry Flour Company states that it will store bulk grain in quantities at its great elevator at Vallejo and that it will be in the market for wheat in bulk. The Western Pacific Grain Company writes that it prefers to purchase bulk grain, and, finally, those farmers who have harvested and sold their grain in bulk for several years have mar-keted it without any difficulty in that form, and at good prices. Among these are Andrew Kaiser of Glenn County, H. P. Mohr of Pleasanton and Moreing Brothers with their vast ranch on the American River. All of them say that they wouldn't go back to the old system if they could get sacks for nothing.

The cabinet and other advisers are now working with President Harding on the railroad problem. Following a recent cabinet meeting President Hard-ing called Chairman Clark of the in-terstate commerce committee and Chairman Barton of the railroad labor board into conference. The newspa-pers say "Chairman Clark informed the president that any further in-crease in rates would only stifle com-merce without producing additional revenue and that a reduction in rates is out of the question until operating expenses are curtailed." It seems cer-tain that just now the transportation problem is the most acute of all prob-lems, affecting practically every other interest, and that methods of lower-ing railroad costs and freight rates will be the chief subject in the first message of the president to congress.

Germain introduces wonderful new fancy strain of

Dwarf MILO MAIZE

increases yield 2 to 1

Most profitable grain-sorghum ever produced; drouth resisting to last degree. Never attains growth of more than three feet which makes harvesting easy. Stalks are one mass of leaves and are greatly relished by stock.

Specify **Germain's Dwarf Milo Maize,** the original PROVEN strain from selected seed. Buy from your dealer.

Address Dept. B for free copy of our 1921 Catalog. It will interest you from start to finish.

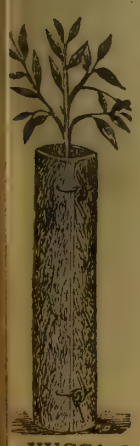
"THE BOSS" TREE PROTECTOR



We are the originators of the YUCCA PALM tree protectors and they have been on the mar-ket for 30 years. The color is light—a perfect protection against Rabbits, Grasshoppers, Heat of the Sun, Borers and Frost. It is quicker to put on than any other tree protector in the market. No strings to tie—ready for immedi-ate use. Is open grained and allows free circulation of air. Can be readily taken off to spray the trees. Not affected by rain.

Cheap—Durable and Guaranteed to Give Satisfaction

We make all widths and sizes. Ask your Nurseryman about them or send direct to us for free sam-ple and prices.

YUCCA MANUFACTURING CO.
380 Willow St. Los Angeles, Cal.

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agricul-ture have proved it to be of the greatest value in the Southern and Western states, where rainfall is de-ficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Price Per Pound:
10 lb. lots, 20c
100 lb. lots, 15c
250 lb. lots, 12c
500 lb. lots, 11c
1000 lb. lots, 10c

Walnuts on Thin Soil

I should like to know if English walnuts will thrive in a sandy soil which does not go deeper than three feet; also is it is safe to plant in soil where root knot is present. Will it attack the black walnut root? — Subscriber, Lankershim.

Your conditions are not ideal. However, walnuts planted on soil three feet deep may grow and bear very good crops if they are not neglected and have constant attention. It must be borne in mind that soil of that depth gives rather scant feeding ground for the roots, and also that it will lose its moisture rapidly. Hence, frequent irrigations will be essential. This is, of course, presuming that your soil is in fine condition and is rich. Bear in mind these roots must never get dry. To that end the first step should be to guarantee to them a dependable water supply. As to root knot it may not always be existent in the soil, but there is always possibility of its development, especially if the roots are injured by careless cultivation. To prevent attack of root knot the dirt may be scraped away from around the crown of the tree and to the upper spreading roots and if the knot is observed it should be cut out at its first appearance. If forming on a small root remove the root above the knot and burn it. If a small knot has formed on a large root it may carefully be chiseled out down to healthy wood where the wound may be painted with Bordeaux paste. It will also be well to make careful examination as to presence of oak root fungus. If roots are found diseased and show white threadlike lines it is very probable that you have a case of this pest of many orchards.

Ration for Cow

A subscriber at Shafter, Kern County, who is feeding alfalfa hay and Egyptian corn to a Jersey cow giving ten quarts of milk is anxious to know what other concentrates he can feed which will balance the ration and give better milk flow.

This question was referred to Prof. Woll who make the following suggestions:

"A ration may be made up from alfalfa hay and Egyptian corn which will supply the various nutrients in about the right proportion for good milk cows, e. g., by feeding 20 to 25 pounds of alfalfa hay and 5 to 8 pounds of Egyptian corn. Such a ration will not prove very satisfactory for the purpose stated, however, because it contains only one grain feed which is, moreover, not especially palatable to stock. It can be improved upon by giving a variety of grain feeds, at least two or three. The choice of these must depend upon the feeds on hand and those which local feed stores carry, and their cost. During the past season coconut meal has been the cheapest concentrate on the market and, if available, a considerable proportion thereof should be included in the ration, say one-third to one-fourth. If market prices of grain feeds stand in about the same relation to each other as in the Bay region, the grain ration fed may be composed of Egyptian corn and coconut meal, two parts each, and mill feed or wheat bran one part, all by weight. If barley can be had at a similar price as Egyptian corn and at a lower price than mill feed or bran, a ration of equal parts by weight of Egyptian corn, rolled barley and coconut meal may be recommended. If the cow gives about 20 quarts (about 43 pounds) of milk a day, she is entitled to a good grain ration, viz., 10 to 12 pounds daily. She will undoubtedly increase in production with a change in the ration as suggested and will pay well for the improved method of feeding. The addition of green feeds, roots, or other succulent feeds would further improve the ration and stimulate the milk production of the cow. Dairy cows of the type owned by the subscriber are not numerous and will respond to good feeding and care. The best is none too good for them. The general principles governing the feeding of dairy cows are discussed briefly in Circular No. 215 issued by the college of agriculture of the University of California, Berkeley, and may be had upon application. The information given in this circular should prove of value to all dairymen, and especially to those owning dairy cows of good productive capacity."

Road Work Delayed

Please inform me through the California Cultivator to what authorities to appeal in order to get action on highway improvements in San Luis Obispo County. Bonds have been voted for improving the highway from Nipomo and Gaudaloupe and we want to see something started. — Subscriber, Nipomo.

We presume this is road work contemplated by the state highway commission. If so, write the commission at Sacramento. It is rather exasperating when bonds have been voted to have improvements delayed several years, but it takes time for the commission to get to all sections for which bonds were voted. Again, this may be a county bond proposition. If so, get in touch with the board of supervisors of San Luis Obispo. Also a point to consider in this matter of delay in road work is that cash from the sale of bonds is not available immediately after the voting for it requires time before all the red tape is unwound and the cash is actually in hand for the work.

State Trade-Mark

What are the necessary proceedings to take in order to obtain a state trade-mark for use on food product from one's own farm? How should one go about registering the name of one's farm? Can you give me an idea of the cost of the above registering and obtaining of trade-mark?—Subscriber, Byron.

Write to the Secretary of State for California, Sacramento, and ask for application blank for registration under the Farm and Villa Act, or one may simply use the following form:

"Application. To all whom it may concern: Be it known that..... being the owner of a..... located at....., County of....., State of California, hereby applies for registration as a name for said..... the following words ....."

Enclose with this blank a fee of $1. This particular form is used principally for protecting the name of the farm home and is of but little value. For the state trade-mark secure the blank from the Secretary of State fo. California. After filling out file with the required fee of $5. Within the boundaries of the state this trade-mark is practically as good as one secured from the federal government.

Seedling Fruits

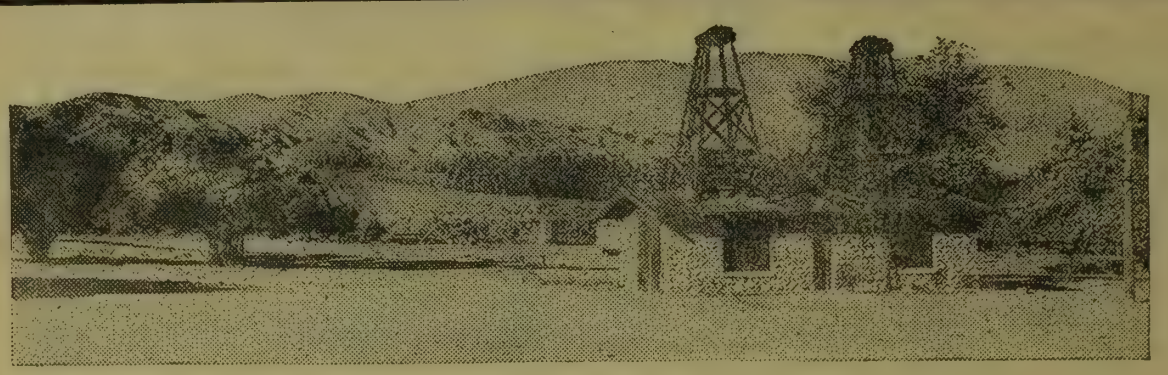
Will seedlings from apricot, peach and nectarine produce as good fruit as the parent tree? And how about seedlings from seedlings? Or is it absolutely necessary to bud or graft to get good fruit?—Subscriber, Chino.

Probably not, at least not more than one in a thousand. The tendency seems to be to revert. It is barely possible that seedlings from seedlings would come nearer to the parent than would the seed of budded trees. It is necessary to graft if one is producing commercial fruits.

Grafting California Walnut

Can California wild walnut trees be budded to other varieties of walnuts? If so, what method is used? Please describe in detail. — Subscriber, San Marcos.

Yes, and the methods have been described in previous issues of this paper. It is now too late to accomplish the work for this year. Next February or March the scions should be secured from highest quality trees and a careful grafter will be able to make valuable tree from the California wild walnut. Where one plants the seed he usually prefers to secure it from northern seedling trees.



World's Largest Lemon Grove Irrigated With Layne & Bowler Water

Here is shown a view of the double pumping plant equipped with Layne & Bowler Pumps located on the famous Teague & McKevitt Lemon Ranch—the largest single grove of its kind in the world. C. C. Teague, President of the California Fruit Growers Exchange and the California Walnut Growers Association, several years ago gave preference to Layne & Bowler Pumps by selecting them for his famous groves. More than 7,000 irrigators depend upon Layne & Bowler Pumps.

LITTLE BROWN HOUSE

There's a little pink tree in my garden,
Cocky and spruce with pride,
For in it a mocking bird built his nest;
He sings day and night, for he's ended his quest,
And he sings to his little bride.
My little pink tree enfolds the pair,
Shelters the treasure and holds them there;
And gently the petals drift down on me,
Sewing under my little pink tree—
Some call it a quince of Japan, but to me,
To me it's my little pink tree.

My little brown house, wistaria-grown,
Is a riot of purple bloom;
The gnarled old vine's long tendrils twine
Right into my little room.
Bumble-bees scorn the other trees,
Nectarine, orange and pear,
And their lazy zoom-m-m-m through the honeyed bloom
Quivers the still Spring air.
But under the wonder of Nature's touch
It's only a cottage, not very much—
My little brown house—but after all
Love called to me and I answered the call;
And under my little pink tree I sew.
Watching a tiny garment grow;
And into my little brown house I go
With the lilt in my heart that true loves know,
To put on the kettle and eagerly wait
For my dear one's hand on the garden gate.
Oh, little brown house and little pink tree
You are the heart of the world to me!
—Phyllys Drenforth Fortune, in March Sunset.

AT THE EDGE OF HILOTOWN

(Concluded.)

With several quite magnificent bows the messenger got upon his horse and went galloping away, leaving the baron with his mouth wide open. He grunted loudly several times, then he sank down into the chair and tried to think of nothing. He could not think of nothing, he found it harder and harder, for the simple reason that the air was full of all the most delicious smells in the world—savory meat, and spicy dressing and the breath of fresh crusty bread.

The baron wanted to eat, and he wanted to eat right away, but it couldn't be done. The dinner must wait until the duke arrived, and a lunch would ruin even the strongest appetite. So the baron fumed and sputtered. He did this until he was almost as hot as the kitchen, then he happened to look around for Ellareen; he was supposed to be tending her. Five minutes before, she had been sitting on the step, digging the dirt out of a crack with a bent pin. Now she was gone.

The baron shouted until he was tired, and all the servants, knowing that Ellareen was lost again, came, untying their aprons or brushing off their jackets, ready to go upon the daily hunt.

"Maybe she's down at the mud pie corner," puffed the baron. "Some of you circle the grounds. Look into all the lowest apple trees and then go out to the meadows. We must find her at once or she will dirty her dress—and besides, she might fall into the creek."

The baron himself went around to look into the stable yard. He could see Ranga, the only one left, beating cream in the kitchen doorway, and Gyp came up to the fence, sniffing timidly. Inside the stable a sleek brown horse was switching his tail. The baron slapped his red velvet sides and cried:

"While I wait I shall go and buy the watch dog. Ellareen must not be running wild while the duke is here. Come Ranga, saddle my horse and saddle one for yourself too. You must accompany me in case the saddle slips." He meant in case he slipped, for he was not even a middling good rider.

Ranga's hot face looked quite dismayed at this for the roasts had just come from the ovens and were not yet decorated, and there were ices to freeze and cherries to stone. He was the only one who was glad that the duke had decided to take a nap.

The baron bent down to walk through the kitchen door. He stuck his hands into his pockets and gazed proudly around while Ranga untied his calico apron.

"Ah, the pantry, the pantry!" murmured the baron, peeping in at the fragrant meats and the rows of goodies. "A goodly array, Ranga. But stay, we cannot leave it alone, there are hungry tramps and prowlers. Leave the dog to guard."

Ranga nodded and hurried out to the stable while the baron bustled through the house to get his feathered hat.

It was very cool on the lake road and the baron almost forgot that he was starving. He slipped only twice and felt very proud of himself, thinking how exquisite a picture he must make in his gleaming velvet and the black plumed hat. But his pleasure did not last long, for the watch dog dealer had had no better sense, no more judgment, than to sell the very last dog to a plumber in Hilotown.

The baron was extremely cranky all the way home but as his own wooden tower came into sight he began to sniff and remember the roast pig, and he turned forgivingly to Ranga.

"You are sure that dog will guard the kitchen well?"

Ranga bowed.

"He will, sire. I locked him in the pantry."

There was an explosion of dust and words which left the air quite smoky for a moment. The outraged baron, purple-faced and breathless, spurred his horse ahead to save a last remnant of the sacrificed meats, and Ranga followed, open mouthed. He thought a bee had stung straight through the crimson velvet.

The pantry door was locked, just as the cook had said. The baron put his hand to his chest feverishly as he turned the key; he had not the heart to look. After a long moment he turned his head and stared through the open door.

Gyp sat alertly on the stone floor. On the first shelf, just even with his hungry mouth, was the largest roast pig, untouched. Behind him stretched the cross shelf with its load of juicy beef and chicken pies.

For a moment the baron could not speak. Then he held out his hand.

"Good dog!" he choked. "Good dog!"

He tottered into the dining room. Perhaps the duke had arrived. Perhaps—but where were the servants! He found them finally, gathered into a little whispering knot down under the hickory nut tree.

"We cannot find her, Sir!" spoke up the perkiest parlor maid, and burst into tears.

The baron's head reeled. Ellareen was lost this time. really lost, his little pug-nosed Ellareen. He could hear the servants talking; they had searched everywhere, they were planning to ride into the city and look.

The baron sank to the grass and crushed a hundred daisies with his weight. He tried to speak. He looked about, dazed, and something cold and soft snuggled into his hand. It was Gyp's nose.

"Good dog! Find Ellareen! Good dog!" wheezed the baron.

The good dog went sniffing toward the house and puffing after him went the baron. Straight into the open front door pattered Gyp, and up the stairs.

Sniff, sniff went Gyp along the upper hall. He stopped and whined before the nursery door. The baron turned the knob. Of course not even a wise man would have thought to look for a little lost girl in her nursery, but there she was.

Ellareen sat contentedly on the white fur rug before the window. She was humming a jerky tune and painting busily with both hands grasping the big brush. The white fur was already beautifully spotted with green and green paint was oozing down the sides of the pail. The Hilotown carpenter had missed that paint as soon as he got home after erecting the baron's new chicken coop, but he was quite too lazy to go back after it.

Ellareen was too busy to hear the noise behind her, and after gazing fondly and proudly for a moment the baron turned and went downstairs with Gyp trailing after.

"Found her!" called the baron to the servants still standing under the hickory nut tree. "This is Ellareen's new watch dog and he found her at once. She won't get lost again."

Sudenly the baron straightened up and looked very dignified, for up the winding driveway were coming the duke and his retinue. There were a great many banners waving in the gentle wind, and as they drew nearer a bell-like trumpet blew, but the duke with his drooping mustache still looked quite sleepy and was yawning behind his hand.

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y.

When writing advertisers, mention the Cultivator.

"I'll wake him up," said the baron to himself as he and the duke kissed each other loudly.

So he whispered in the royal ear, "Roast pig, Denheim. Dinner is served."

It was served indeed. One wouldn't believe that a board could be filled with goodies steaming and icy as quickly as that one was. Ellareen was brought down and ate dinner with the paintbrush in her lap, as she refused to give it up. And Gyp sat between the chairs of his new mistress and the baron and caught the tempting bits tossed to him like a thoroughbred.

VEGETABLE RECIPES

By Helen Lyman

Browned Turnips

Take eight turnips, one and a half tablespoons of butter, half a teaspoon of sugar, salt and pepper. Peel turnips and cut in slices rather thick. Boil in salted water until tender. Drain well. Melt butter, when hot put in the turnips and sugar, fry until well browned, sprinkle with pepper and salt, serve at once.

Spinach Souffle

One quart of spinach, three eggs, little cream, salt and pepper, a few browned crumbs, little butter. Rub spinach through sieve after stewing well, add beaten yolks, cream, salt and pepper to spinach. Whisk whites to a froth, stir into mixture. Put into small souffle dishes, sprinkle with a little parsley and browned crumbs. Bake until well browned.

Vegetable Pie

Line a deep pie plate with pie crust. Boil one small cabbage, and chop fine, chop three hard boiled eggs, add a little salt and pepper, fill plate. Put bits of butter over it, then cover with a top crust. Bake in a moderate oven until well done.

Potato Apples

Two cups of hot potatoes, two tablespoons butter, one-third cup cheese, little salt and cayenne, a grating of nutmeg, little thick cream, yolks of two eggs. Mix ingredients in order given and beat well. Shape in form of small apples, roll in flour, egg and crumbs, fry in hot fat and drain on paper. Insert a clove at blossom end.

Vegetable Relish

Mix two cups cabbage, two green peppers, cut in shreds or chop, little celery seed and salt, brown sugar and one-fourth cup vinegar.

Sweet Potato Cup Custard

Take one large raw sweet potato and grate fine, add three eggs, one pint fresh milk, one cup sugar. Beat well and add vanilla flavoring. Cook in oven two minutes.

Corn Wriggle

One quart boiled corn, one can salmon, one pint milk, one cup water, one tablespoon flour, little butter, salt and pepper. Put corn and water on stove, let boil five minutes, add flour and butter creamed together, have milk hot, add salmon after picking over and removing all bones. Very delicious eaten as soon as it is prepared.

Parsnip Croquettes

Six parsnips, two eggs, a little flour, salt and pepper, egg and bread crumbs. Boil parsnips until tender, chop fine, add two beaten eggs and a little flour. Make into balls, with beaten egg, cover with crumbs. Fry in hot fat until golden brown. Serve very hot.

Tomato Soup

Take one quart of liquid meat was boiled in, put in a quart of tomatoes well chopped and one chopped onion, pepper and salt. Cook until tomatoes are soft, then strain, add a teaspoon of flour, dissolved in a little water, stirred in. Allow to boil ten minutes.

Turnips Creamed

Put some turnips in a stew dish with a little salt, butter and sugar. Simmer well, add a little pepper and serve in the sauce in which they were cooked, with a little chopped parsley.

Creamed Squash

Peel two squashes, cut in dice, boil in salted water until tender, drain, keep hot. Cook with a little butter and flour, and lastly pour in one-half cup of cream. Stir well and serve.

Fricasseed Beans

One cup of beans, one onion, one clove garlic, a little parsley and one hard cooked egg, one raw egg, little white sauce, salt and pepper. Soak beans in cold water two hours, put in saucepan with milk and water to cover them, sliced onions and garlic. Simmer four hours until beans are tender. Stir often. Take out onion and garlic, drain off milk and water, put sauce in another dish, heat it, add lemon juice, raw egg, lastly cooked beans. Arrange beans in a fancy dish, rub the hard boiled egg through a sieve, sprinkle over top. Garnish with chopped beets.

THE HOLINESS OF BEAUTY

You may never be a painter, but you can be a gardener. With a little effort you can take a piece of unsightly brown earth for your canvas and put upon it a fairer scene than ever fell from painter's brush. This is not all. You stand in the very gateway of the eternal beauty. You are a co-worker with God, with the great Artist who paints life, who puts that resplendent bow on the brow of the storm, who tints the mountains of cloud with amber and amethyst as they stand sentinel by the dying day.

Is it not wonderful that this Artist of the everlasting beauty will come down and work with you and second all your efforts? You plant the seeds and bulbs and wield the hoe, and that simple instrument becomes a wand in the hand of a king. You touch the earth and miracles of beauty spring up. Then the unseen brushes begin their work. In the sweet, still and dewy morning, in the calmness of the night, and in the heat of noon, He works with you. Plant the rose, the peony, the tulip and the columbine, and care for them, and lo, the silent partner comes without noise or heraldry, and the blessed work goes on. Soon a thrill comes to you. You feel the honor of it, the glory of it—this partnership with Him who paints the splendors of the suns.

* * *

We pass this way but once. Let us beautify the path as we go, so that the world may see which way we went. —C. S. Harrison in The Flower Garden.

HOUSEHOLD QUERIES

Who Knows?

A Cultivator reader asks if anyone has saved in an old scrapbook the poem, "There's but One Pair of Stockings to Mend Tonight." If so, we will appreciate very much having it sent in to the household department.

Calla Lily Stain

Could someone tell what will take out stains which come when you get the clear watery looking juice that almost drips from a calla lily stalk? It does not make a stain that shows until the cloth has been laundered. Few seem to know that it will stain, therefore are not careful. I learned from experience. I certainly do enjoy the Cultivator and the many good hints we get from it.—Subscriber, Riverside.

Calf Clubs

I read where they have calf clubs. Can you give me the address of one, as I have a fine calf and would like to join one. I am 13 years old September 14.—Reader, Delano.

The calf clubs are usually organized under direction of the farm bureau. Ask the officers of the Delano farm center or your county farm adviser, M. A. Rice, at Bakersfield.

HINTS FROM HOUSEKEEPERS

Orange Juice Icing

Icing for cake, which is very easy to make and will harden nicely but not crack can be made from the juice of the Blood orange thickened with pulverized sugar.—Mrs. John F. Lippincott, Riverside.

Sugar Pie

Seeing the inquiry for sugar pie, I will give my recipe:

First, when I have enough crust left from making pies to just line a pie tin, I prick it well to keep it from

The Cultivator Patterns

BE SURE TO SEND SIZE

3559. Misses' Dress. Cut in three sizes: 16, 18 and 20 years. An 18 year size will require 4⅜ yards of 44 inch material. The width of the skirt at the lower edge is 2 yards. Price 10 cents.

3586. Child's Dress. Cut in four sizes: 2, 3, 4 and 5 years. A 4 year size will require 3⅜ yards of 27 inch material. Price 10 cents.

3560. Ladies' House Dress. Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 5⅝ yards of 36 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

3562. Junior's Dress. Cut in three sizes: 12, 14 and 16 years. A 14 year size will require 3⅛ yards of 44 inch material. Price 10 cents.

3577. Ladies' Dress. Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6¾ yards of 40 inch material. The width of the skirt at the foot is about 2 yards. Price 10 cents.

3575. Set of Garments for an Infant. Cut in one size: The dress will require 2⅛ yards of 36 inch material; the Barrie Coat 2¼ yards and the Robe 2¼ yards. Price 10 cents.

3571. A Practical Undergarment. Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44 extra large, 46-48 inches bust measure. A medium size will require 3 yards of 36 inch material. Price 10 cents.

3563. Girl's Dress. Cut in four sizes: 8, 10, 12 and 14 years. A 12 year size will require 5 yards of 27 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or, (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

puffing but not enough so it will leak. Then I put in half a cup of sugar, sprinkle with cinnamon, dot with butter and pour in one cup of milk, sometimes add a little coconut or a few raisins. Bake fast enough so it will not get soggy, but do not let it burn. It takes quite a little while to thicken the milk so it will not run. This was always a special favorite with the children.

Second, Maple Cream or Sugar Pie. —Line pie tin with crust, prick and bake as for a lemon pie. When baked and cool, put this filling into it: Mix 1 cup maple sugar, ½ cup flour, 2 tablespoons milk which has been mixed with the yolks of 2 well beaten eggs. Put this in double boiler and when boiling hot mix a little at a time until all is mixed, then beat smooth and cook a short time longer. Turn in to the pie shell, spread over with a meringue of the two whites beaten stiff and slightly sweetened. Bake in a slow oven until the filling is well set and top a light brown. I think either brown or white sugar could be used and use any flavor preferred.—Mrs. E. A. C., Winters.

Headwork lightens housework.

There is no luxury equal to good plumbing; none so necessary.

We often talk of the good old days of our grandmothers. Think what it would mean to live in a house without plumbing!

When you are tired and aching from a long hard day's work, step into a tub of hot water and soak out all the ache and weariness. Finish off with a douche of cold water, put on clean fresh clothing and you feel a new woman indeed, the kind you want to be, fresh and rested and ready to be a pleasant companion in your family.

Many a nervous headache will yield to the hot water treatment, hot water outside and in. An enema of warm water, followed by soaking the feet in water as hot as can be borne, then by a long leisurely soaking bath in warm water will draw the blood from the head and restore the jangled nerves. Try it.

If you are building or putting in new plumbing, here is a suggestion worth noting. Have the stationary laundry tray installed beside the kitchen sink, fitted with hinged, sloping cover which serves as drainboard. The clothes wringer may be screwed between tub and sink, a rubber stopper placed in sink—and you have two tubs. The wide shallow sink is particularly convenient for bluing. It's hard for a bit of linen to conceal itself under something else and come out bluer than it should.

Builders and plumbers nowadays ask the mistress of the house just how high she wants her kitchen sink and laundry tubs set, and set them accordingly. Formerly they were set too low for any but the very short woman. If the women in the household come in assorted sizes it is easier for the short ones to stand on a board or a low bench to reach a high tub than for the tall ones to break their backs stooping.

If you have a tricky or inconvenient faucet on the kitchen sink that will not yield to the efforts of the repair man, it is an easy matter, and not expensive, to replace with entirely new faucet that does fill your need.

A tank of hot water, available night and day, is to be counted among the major blessings of civilization. It is not only cleansing, but curative and comforting.

Let the boys rig up a shower bath of their own outside the house this summer. There is something about a shower, suggestive of games and athletics, that appeals particularly to the boy mind, and the shower bath habit once acquired as half fun will stick through life to the physical and moral well being of the boy.

the life of the party

Say "Gear-ar-delly"

Whether it's a "little party" or a "big affair" Ghirardelli's is a great comfort to any hostess [big or little]. Cups of creamy, hot chocolate, chocolate layer cake, "fascinating" squares of chocolate fudge [not to mention a host of other goodies] —you can rely on Ghirardelli's to be the life of the party.

Ask for Ghirardelli's at the store where you trade; and write for our Book of Chocolate Recipes—it's free!

MOLASSES

"....never saw hogs grow so fast"
says Mr. C. V. Hartwig, Yuba City, Cal.

Mr. Hartwig writes us more fully, "Your molasses mixed with ground barley and tankage made an excellent hog feed. I never saw hogs do so well or grow so fast."

Hogs, wherever grown, have about the same habits. The feed that will put on fat fastest in Yuba City will do the same thing in Sacramento or Imperial Valley. Molasses should figure in your **ration**, because it **makes fat** and does it cheaper than feed you are now using. Camo Molasses is a cheap feed and a fattener.

Let us give you facts and figures about feeding, that spell the difference between profits and loss. Let us tell you what Molasses will do for **you** and **your** stock. Ask us to send you our interesting booklet. Write for it today.

Jane Garden Holsteins Average $493

By R. P. Royce

The complete dispersal of the famous Jane Garden herd of Holsteins, owned by Fred W. Kiesel of Sacramento, April 6 and 7, proved to be one of the most successful sales ever held in California. One hundred and sixty-seven head of f males and three bulls sold for a total of $83,570, an average of $493. In view of the fact that the offering included many small calves and that none of the cattle were sold subject to the tuberculin test the above average can be taken as an indication of the strength of the Holstein industry in this state and the high regard held for Jane Garden Holsteins.

The Holstein operations of Mr. Kiesel, culminating in the dispersal of his herd, should offer considerable encouragement to established breeders and should point the way for men who have recently entered the business or who expect to establish herds. Before Mr. Kiesel owned a single Holstein he built and filled two silos. That fact in itself, while not important, indicates the thoroughgoing way Mr. Kiesel set about going into the breeding business. In assembling his herd Mr. Kiesel selected animals of accepted type and proven bloodlines and in the selection of his herd bulls he has been content with nothing short of the best obtainable. That such a plan has been sound and profitable is attested by the sale list. Three bulls saw extensive service in the herd; Prince Gelsche Walker Korndyke, King Korndyke Pontiac and Sir Aaggie De Kol Acme. Thirty daughters of the first named bull averaged $390; 26 daughters of King Korndyke Pontiac averaged $548 and 38 daughters of Sir Aaggie De Kol Acme, many of them baby calves, averaged $494. No man who watched the sale could fail to grasp the demonstration of the value of a proven sire.

The sale was remarkable in that no high values were recorded, the top being reached at $1600, the price paid by J. W. Scudder for King Korndyke Pontiac. At the price named Mr. Scudder secured a rare bargain.

The top price for a female was fetched by the 34.10 pound two year old, Jane Garden Viola De Kol, a daughter of Sir Aaggie De Kol Acme, that was taken by E. A. Gammon for $1250.

Mr. Gammon, who is establishing a high class herd on his Hope Farm, Franklin, was the heaviest buyer, selecting 25 head of the tops for an average of $719. E. Burr of Los Angeles selected 30 head of heifers for shipment to Canada, where he is establish-

THE CALIFORNIA NATIONAL LIVESTOCK SHOW

By R. P. ROYCE

Last week a meeting was held in San Francisco at which plans were discussed for launching a livestock show to be held this fall. The meeting was attended by representative livestock men, business men and newspaper men. The project has received the hearty support of all interests and at this time it appears certain that the California National Livestock Show will become a fact.

This matter of a strong annual livestock show is one of vital concern to the livestock interests of this state, but overshadowing that importance is the great service such a show can be made to render in the development of California.

Now, as never before, the general public has come to realize that after all the prosperity of agriculture measures the prosperity of all. And because it is recognized by all that a successful scheme of agriculture can only be developed where livestock is given a major role, it is of the highest importance to the general welfare that that branch of agriculture be stimulated and fostered. A properly organized and conducted livestock show will stimulate and foster the industry as will no other means. Such a show accomplishes that end, not by simply providing a place where a few breeders meet and compete for honors, but by demonstrating the practical value of better cattle, horses, sheep and swine and lending inspiration to men not handling the better sorts to improve their herds and flocks.

Unless the livestock industry is prosperous other branches suffer. Profit with livestock can only come through widening the margin between production costs and selling prices. Better bred livestock, because such stock is more efficient, will widen that margin by lowering production costs.

The purebred livestock industry of California is still a young industry, but enough has been accomplished to demonstrate that every condition necessary for the production of superior livestock is present in this state. All that is needed is a stimulating influence such as the proposed show will provide.

We feel certain that the efforts of the organizers will receive the unstinted support of all breeders. We take is for granted that San Francisco has recognized the practical value of such a show. If not, let San Francisco ask Chicago, Kansas City, Denver, Portland or any other city that is the home of similar shows.

tal of $7245. E. Ehrig of Stockton made his initial purchase with eight head. Other strong supporters were: Frank Helm, Fresno; J. R. Crawford, Burrell; Dr. J. M. Crawford, Fresno; G. W. Dwinnell and J. B. Rohrer of Montague; J. M. Hampton, Jr., Live Oak, and J. N. Cook of Orland.

The sale was conducted before large crowds each day; the bidding was very brisk at all times and the arrangements and management were declared to be perfect.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company. Col. Ben A. Rhoades of Los Angeles was the auctioneer and Col. John A. Davis of Manteca worked the ringside.

Many regrets were expressed over Mr. Kiesel's retirement, and even though he does not reenter the business he has the satisfaction of knowing that he has contributed much to the breed and the cattle industry of this state. We need more Kiesels out here.

BULLS

1, King Korndyke Pontiac, April, 1912; J. W. Scudder, Escalon, $1600.
2, Aristo Korndyke Pontiac, Jan., 1919; G. J. Stamm, Sacramento, $1200.

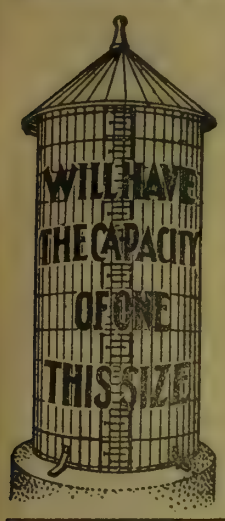
(Continued on Page 530.)

The Cushman
Silage Packer

is a Roller set in a suitable frame on which is mounted the standard Cushman engine—4 H.P. size.

One man in the silo handles the distributing spout and controls the engine.

This lessens the number of men required and packs the silage evenly, eliminating all gas pockets. It will increase capacity of your present silo at least one-third more.



Those who have used them claim that they pay for themselves in a season.

This is no experiment. The engine may be used for other work on the farm also.

The famous 4 H. P. engine used is the one so popular for use on grain and corn binders, manure spreaders, potato diggers. It can be used for pumping, wood sawing, spraying, grinding, making electric lights. It cannot be equalled for power in the blacksmith or machine shop.

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Relief. Gombault's Caustic Balsam will give you immediate Relief. A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applioations of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.75 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

Settle the Packer Agitation

By A. L. Spellmeyer

IT IS well to preface the following statements by saying that the cattle and sheep and hog men of California are in better general financial condition, securing better prices and enjoying a better natural season, than in any other part of the great nation. The California stockman is not on the road to wealth. He is losing money in most instances, but it is a losing of interest on his land and cattle investment rather than actual loss in the investment itself. The producers of this state are as compared to producers in other states in good shape and should be thankful for California's glorious climate and isolation.

There are several questions that are vital to the stability of the livestock business here and elsewhere. One at least of the elements that contribute to the high cost of production, the raise in railroad freight rates, is working with California at present rather than against it.

The vital question that is now affecting all lines of the cattle business particularly is the unsettled packer question. This is operating to the injury of the cattle industry, and irrespective of how it is done, a speedy settlement for or against the packers should be reached by the legislators and these bills pending put through at once or killed. The lessening beef cattle numbers of the country, the continued sacrifice of breeding cows, the soil needs that make livestock imperative on a million farms, the growing population of the country, all demand action. Men must know what is ahead of them, and the loss that the cattle and sheep men are bearing today cannot continue and our meat and wool supply be maintained.

The other vital question is the retail margin of gross profit, and for it three solutions are suggested in many livestock papers; to have the cattle associations organize and establish abattoirs and markets, to have cities establish them, or to permit the packers to market the meat themselves. The danger of the latter course is self evident with a group of men who might act without regard for consumer or producer, as such a complete control of food would mean, to judge by past abuse.

The fact is that today the group of packers is mighty, stronger than any food control has ever been in any history of any country, and, a great senator says, apparently stronger than the government, so it is the open question, will these packers, like Samson of old, wreck the pillars of the livestock industry before they will accept control? The way the pillars have been shaken during the last year or two it looks probable.

There is not even a long shot chance that associations or municipalities will undertake direct marketing, and any one who depends upon the present organization of stockmen to stand together with their money and their votes merely leans upon a rotten reed as their associations are full of the wormholes of self interest, and these cattlemen are split into factional groups and their influence nullified, their potential power made into a joke.

The president of the American National Livestock Association, the Hon. John B. Kendrick, states that cattle associations should "provide for ourselves a strong forceful organization, etc., or disband any form of association." "As it is today our efforts are futile and hence are rightly subject to the scorn of our enemies."

One prominent cattleman and horse breeder says that all he can see in some associations is a chance to pay dues and cast a vote for a few men who do all the moving and talking while some fellows say "Aye" and pay the cost.

Therefore, knowing these things, the cattlemen face an uncertain future, and that alone prevents activity or development of the industry.

While the producers of meat and the packers were wrangling and fighting, like two boys over a watermelon, the third boy came along and took the melon, and that third boy is the retailer.

Packers have passed several dividends; they have spent tens of millions upon their propaganda and advertising campaign; all the while the producers being hit in the markets, which weakened their fighting ability, and this at a time when supply is annually decreasing. All this expense has been levied upon the producer and the consumer. The producer is getting about 50 per cent of his cost of raising the beef and the consumer is paying. Waste is abhorrent. If the cattlemen will not organize now they are not fit. If the consumer won't help the producer let the consumer pay for the inevitable shortage. The retailer is between the millstones and cannot keep up his margin when the packer-producer agitation is once settled. War costs money, whether with guns or a commercial staple.

We hear a lot about cattlemen and sheep men accepting the present prices and writing the lower value off as loss, as a merchant does with stock on which prices have declined. The production of cattle or of sheep depends upon its cost, the cost of the coming crop. That is the rub. The next crop cannot be produced in wool at 20 cents, in beef at its present U. S. price, or in mutton.

The man who owns his land is forced to stand a specified cost, which has not lowered for the coming year and is dependent upon the amount of land investment, and land has shown no decreased valuations to correspond with meat on the hoof. Wages are but a small part of expense, interest being greater, and that has mounted.

Some $5.50 cows that recently sold in Los Angeles after long expensive feeding brought almost enough to pay their feed bill and expense. The steers did better at 9 cents, but showed great loss over their market value at the time they were put into the feed yards. The Cultivator last fall printed my warning as to the lack of prospective profit in any feeding operation that involved heavy expense. It has come true with a vengeance.

There are about 2,000,000 sheep and a lot of cattle in Arizona feeling the effect of a short grass year and drouth. There will be no fat grass lambs from Arizona this spring. Any fat lambs must come from California, and the California sheep man is in clover as compared to others. He has the feed, the fat lambs and a short market. Whether he gets a price will be seen.

The spring cattleman of California has a daily rising Eastern market to figure as his competition, with more than two cents for freight and shrink in his favor. There is just one thing in this world that can prevent the California man from getting ten cents for spring grass beef, if he demands it, and that thing is contracts and cashing in by his brother cattlemen. For a time beef will be about adequate to supply, then the volume will make it greater than demand for a couple of months and less than demand later.

The possibility exists that packers will ship in carcass or live beef, but from the outlook it will cost them money to do it, and while they have done it in outlying districts it's a different matter to ship a train or two of steers or a few dozen cars of beef, bought on the Middle West sacrifice market of the past winter and stored in the coolers, and to supply an approximate 60,000 a month California kill or ten per cent of it, which this state will be using.

From what we can learn the cooler stock has not been piling up, but the packer agitation has disgusted more people than the cattlemen themselves, and the amount of meat consumed has been dropping. It may drop farther as that is always the case when there is lowering of wage returns.

IMP. DENE JEWEL, 589.16 lbs. butterfat, 10,546.4 lbs. milk. Sells well along with calf of King of Hollow Hill.

Dispersal of Rare Guernseys

55---Registered Cows, Heifers and Bulls---55

Hollow Hill Farm

Owned by G. W. Wilder

Colton, Cal.

Thursday, April 28, 1921

An offering that permits a wealth of selection, presenting breeding, production, and show ring quality of high merit. Good health is also a most attractive feature of the herd.. Representative individuals in the sale include

IMP. ANGEROSA III, with 538.08 lbs. butterfat, 10,472.5 lbs. milk, Class AA. Bred to Effie's King of Hollow Hill Farm.

ROSA KING OF HOLLOW HILL FARM, 478.51 lbs. butterfat, 8978.9 lbs. milk as junior 2 year old.

IVA OF BELLMATH II, with 495.7 lbs. butterfat, 10,710 lbs. milk.

FEMALES

IMP CHERRY III OF THE EFFARDS, 735.3 lbs. butterfat at 4½ years. Grand Champion Southern California Fairs 1918 and 1920. Well along with calf to King of Hollow Hill.

IMP. DENE JEWEL, 589.16 lbs. butterfat. Third prize aged cow 1920 California State Fair. Well along with calf to King of Hollow Hill.

JEWEL LANGDON OF HOLLOW HILL FARM, out of Imp. Dene Jewel and by King of Hollow Hill. First Prize junior heifer calf 1920 California State Fair.

CAROLINE LANGDON OF HOLLOW HILL FARM, 473.37 lbs. butterfat as a junior 2 year old. By Effie's King of Hollow Hill Farm and out of the grand foundation cow Caroline of Chilmark, 727.97 lbs. butterfat.

REBECCA OF SUNNYVIEW, 647.86 lbs. butterfat, Class BB. Dam of Grand Champion bull at Arizona State Fair 1920 and junior champion bull at California State Fair 1920, also first prize Produce of Dam at same show.

IMP. ANGEROSA III, with 538.08 lbs. butterfat, Class AA. She is by Imp. Clara's Sequel and bred to Effie's King of Hollow Hill Farm.

ROSA KING OF HOLLOW HILL FARM, 478.51 lbs, butterfat as a junior 2 year old. By Cora's Glen and out of Imp. Angerosa III.

IMP. BRITTLEWARE MOLLY II, by the same sire as Imp. Brittleware Mistletoe, a California class leader with 751.4 lbs. butterfat at 4½ years.

IVA OF BELLMATH II, with 495.7 lbs. butterfat in one year, and her daughter by Tritomas May King.

BULLS

EFFIE'S KING OF HOLLOW HILL FARM, born Oct. 16, 1916. By Cora's Glen and out of Imp. Cherry III of the Effards, 735.3 lbs. butterfat at 4½ years. He sired first prize Get of Sire 1920 California State Fair, also junior champion females at 1920 California and Arizona State Fairs.

REUBEN KING OF HOLLOW HILL FARM, born Feb. 25, 1919. By Cora's Glen and out of Rebecca of Sunnyview, 647.86 lbs. butterfat, Class BB. In 1920 was junior champion at California State Fair and grand champion at Arizona State Fair.

BERT E. KING OF HOLLOW HILL FARM, born Aug. 20, 1919. By King of Hollow Hill and out of Cora's Beatrice, 676.3 lbs. butterfat at 9 years.

ANGER LANGDON OF HOLLOW HILL FARM, born March 3, 1919. By King of Hollow Hill and out of Imp. Angerosa III, 538.08 lbs. butterfat. Class AA.

ANGUS KING OF HOLLOW HILL FARM, born March 26, 1920. By Cora's Glen and out of Imp. Angerosa III (see above).

ROSA'S E. KING OF HOLLOW HILL FARM, born Aug. 16, 1920. By Effie's King of Hollow Hill Farm and out of Rosa King of Hollow Hill Farm, 478.51 lbs. butterfat at 2 years, she is a daughter of Imp. Angerosa III.

AZUCENA'S PENROD, born Nov. 10, 1919. By Pencoyd's Secret Premier and out of Azucena's Cousin, 418.51 lbs. butterfat at 3½ years.

RILEY LANGDON OF HOLLOW HILL FARM, born Dec. 1, 1920. By King of Hollow Hill and out of Lady Rilma, 421.56 lbs. butterfat as a junior 2 year old.

TOPPER LANGDON OF HOLLOW HILL FARM, born April 30, 1918. By King of Hollow Hill and out of Topsy's Legacy. He was first prize 2 year old at 1920 California State Fair.

OTHERS of rich breeding, including some just about ready for service, just the kind to breed production and Guernsey quality into grade dairy herds.

THIS HERD WON 40 firsts, 26 seconds, several championships, and many lesser prizes in the 1920 California and Arizona Fairs.

THE OFFICIAL RECORDS in this herd were made under the trying conditions of a certified dairy.

IN FIVE YEARS of regular tuberculin testing to meet the requirements of a certified dairy, only one animal in this herd has responded to the test.

Every animal over six months old tuberculin tested and sold subject to retest by the buyer; every animal guaranteed a breeder according to terms of catalog. HOLLOW HILL FARM is 4 miles from San Bernardino, 3 miles from Colton, 12 miles from Riverside. SALE HEADQUARTERS, Hotel Reynolds, Riverside.

One can see from the various angles, various considerations and various possibilities how evil a thing is the unsettled packer question, how uncertain the agitation that follows it makes the livestock business, and why it is advisable to either regulate this meat outfit or offer a compromise that both packers and producers can accept, but get it settled so that cattle shortage will not continue, and stop this sacrifice of herds and breeding stock.

The Meat Situation in 1920

There was less meat produced, less exported, and less consumed in the United States last year (1920) than in either of the two previous years, although the consumption in 1919 and 1920 varied but little, the great change being in the exports. These and other facts are brought out in a series of tables recently compiled by the bureau of animal industry, showing the annual status of the meat situation for the calendar years 1907 to 1920, inclusive. The data for each year include: The total slaughter which is divided into federally inspected and non-federally inspected; the exports and imports; and the consumption, total and per capita, of each kind of meat and of all meats combined. The same information is given for lard separately from pork. Some of the salient points indicated by the tables are as follows:

Beef growers made their supreme war effort in 1918 and during that year sent to market 15,750,400 animals, which yielded slightly over 7½ billion pounds of dressed beef. This number has never been approached before or since. In two years the cattle slaughterings have fallen to 12.176,400, with an accompanying decline of 1½ billion pounds in beef production.

The exports of beef products fell from 728,000.000 pounds in 1918 to 164,000,000 pounds in 1920. This was to be expected, as the United States for several years before the world war was not a beef exporting country. South America and Australasia are now the great sources of cheap beef and mutton and naturally will dominate the export trade in those commodities.

Ten years ago the consumption of beef per head of the population in the United States is shown to have been 78 pounds; last year it was not quite 56½ pounds. Beef consumption in the American household has undergone a great change during this time, especially in reducing waste, and doubtless a considerable part of the difference between these amounts formerly found its way into the garbage can.

Perhaps the most outstanding feature of the domestic meat situation in recent years has been the increase in the production and consumption of veal. The demand for calf products has caused a steady increase each year for the last six years, and calves marketed in 1920 more than doubled the number in 1914 and 1915.

Sheep and lamb slaughter was marked by considerable irregularity. The slaughter was greatest from 1911 to 1914, after which it declined for three years, then increased for two years, and in 1920 again declined.

Exports and imports of mutton and lamb have been almost negligible until last year, when New Zealand frozen lamb carcasses were imported in large quantities, making an epoch in the trade. The total weight imported during the year was 101,000,000 pounds, nearly one-fifth of the total domestic production of both mutton and lamb.

Consumption of mutton and lamb in the United States is only about six pounds per person per annum and is very small compared to beef and pork. It is smaller even than veal, of which about eight pounds per person is consumed.

Pork production in 1920 fell considerably below the high record made in 1919 when marketings were unusually large, owing to the high prices prevailing during a part of that year, including the highest ever paid for live hogs. Nevertheless, the consumption of pork was slightly greater in 1920 because of the heavy decrease in exports. The exports of bacon and hams fell off more than one-half, the totals for these two items in round figures being 1,787,000,000 pounds sent abroad in 1919 and 822,000,000 in 1920. The exports of lard, however, almost held their own, decreasing only 20 per cent. This was because Germany, our second best customer for this commodity, was again in the market for quantity and took 128,000,000 pounds, which was within less than 1,000,000 pounds of the total taken by the United Kingdom, always the chief consumer.

COW TESTING—A COMMUNITY BUILDER

"No one doubts that the cow testing association is a good business proposition for the individual member," says E. M. Harmon of the Missouri agricultural extension service. "It serves as a basis for culling the stock and the building of a profitable herd; it helps to solve the dairyman's feeding problems and determines the sale value of dairy animals.

"But the testing association goes farther than that. It interests the community in better and more profitable dairy methods. This point is shown in the progress report of the St. Louis County Association for the past year.

"At the beginning of the year members of this association used 24 silos and by the close they were using 27. Their use of pure bred bulls increased from 15 to 17; pure bred females from 211 to 291; balanced rations from 7 to 13. The number using summer soiling crops increased from three to four; summer silage from three to five. The number daily weighing milk increased from five to seven; members doing official testing from one to four. The number of those having farm lighting systems in their homes increased from 10 to 14.

"In addition to this a pure bred calf club was organized with 23 members. These 23 members came from 16 different farms and in this way the foundation was laid for 16 pure bred herds. Only the best of stock was selected.

"It is of course a matter of interest to know that 57 cows were sold by the members as unprofitable. One man said the tester saved him over $75 a month on his feed bill for 40 cows. But the important thing is that this cow testing association and other such associations are encouraging better dairy methods which will stabilize the dairy industry and make it more profitable."

De Laval

first gave us a better way of separating cream and now a better way of milking

Proof that the De Laval Milker is actually a better way of milking comes from De Laval users from all sections of the country. They are practically unanimous in their agreement that the De Laval increases the production of milk even over good hand milking. The saving in time and the increase in production of milk will soon pay for a De Laval Milker.

Sunny Side Holstein Dispersal

I am dispersing my good Holsteins on April 14, 1921. These will include the daughters of Sir Veeman Korndyke Pontiac and a yearling son of King Korndyke Pontiac 20th out of K. P. Tola who made 36.16 lbs. of butter in 7 days and 1000 pounds in a year.

R. F. Guerin Visalia, Cal.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

April 20-21, Toyon Farm Association, Los Altos.
April 26, Santa Anita Rancho, Santa Anita.
May 11, Victory Herd, Carruthers.
May 18-19, James McGillivray, Sacramento.

Shorthorns

May 26, Caledonia Farms, West Sacramento.

R. K. Walker of Diamond Bar Ranch writes: "We have recently sold Diamond Sensation 2d, a litter mate to Diamond Sensation, to Sargent Brothers of Whittier. This is one of the good yearling boars in the West and is sired by the world's grand champion, Great Orion Sensation, and out of a dam by old Pathfinder. This boar will undoubtedly make a great name for himself. We also sold a splendid February yearling boar by Great Pathfinder and out of Model Lucy to Osterman & Osterman of El Toro, and a March yearling by Mammoth Sensation Jr., and out of a Pathfinder bred sow, to Victor Magee of Oceanside. These men were all purchasers of bred sows in our February bred sow sale."

J. I. Thompson, manager of Straloch Farm, Davis, is now in the East visiting the leading Shorthorn herds. It is probable that Thompson will select a carload of females to add to the Straloch herd.

J. R. Bush of Merced, who was one of the heaviest buyers at the Jane Garden Holstein dispersal sale, has purchased from Mr. Kiesel a young bull sired by Sir Aaggie De Kol Acme and out of Korndyke Sadie Vale Star-Rena. The dam of Mr. Bush's bull is a 21 pound daughter of King Korndyke Sadie Vale and her seven nearest dams average 33.84 pounds butter in seven days. She was purchased by Mr. Kiesel for $3,100, which is the highest price ever paid in this state for a heifer of her age.

E. Burr, owner of Burr Farm, Los Angeles, attended the Jane Garden sale and selected 30 head of choice heifers as a foundation for a herd that he is establishing near Calgary, Canada. This shipment will be the first lot of California Holsteins ever sent to Canada. While Mr. Burr could have secured Holsteins nearer his new ranch, he stated that he selected California Holsteins because he was convinced that this state produced the best.

P. B. Cross of San Francisco, who is generally known as the rice king of the Sacramento Valley, is developing a large ranch near Cottonwood, Shasta County. H. L. Fisher, manager for Mr. Cross, states that it is planned to establish select herds of Shorthorn cattle and Berkshire swine. Mr. Fisher says that four 400 ton silos have been built and that plans are under way for the construction of five barns to house 125 head of cattle each and a farrowing barn for 150 head of sows. Over 350 acres of alfalfa have been put in.

Harry L. Redd, the popular young Holstein herdsman formerly with W. J. Higdon of Tulare and more recently with Fred W. Kiesel of Sacramento, is now in charge of the large herd of Holsteins owned by Frank Helm of Fresno. Mr. Helm has one of the largest and choicest herds owned in this state and from now on expects to develop his herd to a high point.

Howard Vaughn of Dixon has recently sold a Shorthorn bull to J. B. Alameda of Napa and a Chester White boar and sow to Harold T. Bolden of Fort Bragg.

Announcement is made this week of a sale of 180 head of registered Holsteins from the Willowmead herd owned by James McGillivray of Sacramento. The Willowmead herd is one of the largest and best known herds in the state.

Robert N. Clapp of Nuevo, Riverside County, has sold the young bull Rosamaines Pontiac Ormsby, who is by Sir Skylark Ormsby Hengerveld and out of the cow Stanislaus Piebe Laura Pontiac, who recently made 32.8 pounds of butter in seven days for Mr. Clapp, to Frank Helm of Fresno.

Blood of Tremendous Milk Producers AT PUBLIC AUCTION

177--Registered Holsteins--177

167 Females **10 Bulls**

Willowmead Herd Owned by Jas. McGillivray **Sacramento, Cal.**

Wednesday and Thursday, May 18-19, 1921

Just at the close of 1920 Mr. McGillivray sold most of his 1200 acre ranch near Galt and was compelled to consolidate his Holstein holdings on his Sacramento place. The herd at present numbers 500 head of registered Holsteins and a substantial reduction in numbers is necessary. It has finally been decided to sell all of the milking herd and a few bred heifers to effect the reduction. Absolutely every cow in the herd that is in salable condition is in this sale.

85 Fresh Cows in Sale—Many Others Milking Heavy Right Now

A Large Number of Heavy Springers—Some Splendid Bred Heifers

A Very Large Percentage of the Bred Females are in Calf to One or the Other of These Two Bulls:

COLONY ZARILDA NEWMAN

Sire: AAGGIE CORNUCOPIA NEWMAN, a son of the former world's record milk cow Margie Newman, who milked 868.2 lbs. in 7 days and has a daughter that milked 763.5 lbs. in 7 days.
Dam: ZARILDA CLOTHILDE 3D DE KOL, the great Canadian cow that milked 33,153.6 lbs. in one year and over 30,000 lbs. at a subsequent freshening.

PRINCE ECHO SYLVIA SEGIS

Sire: CHAMPION ECHO SYLVIA PONTIAC, a son of the world's record milk producer May Echo Sylvia, who is also dam of the $106,000.00 bull Carnation King Sylvia.
Dam: PRINCESS STELLA SEGIS, a 29.88 lb. 4 year old daughter of King Pieter and Countess Segis, a 31.70 lb. daughter of King Segis.

THINK OF IT, 167 registered Holstein females, mostly all cows, more than half of them now fresh, many others heavy springers, and nearly half of all of them bred to one of the above bulls.

The owner is prepared to extend most liberal credit to responsible parties. Applications may now be made either by letter or in person to JAS. McGILLIVRAY, R1, Sacramento, Calif.

Every animal positively guaranteed to be a breeder: no tuberculin test certificates.

EXPORT MARKETING

Exporting pure bred livestock to foreign countries is a highly complex process and breeders who contemplate entering the export field should not only take all the short cuts possible but should be extremely careful that no essential step is overlooked. All the items of expense are relatively costly and failure to attend to every detail may result in delay and added expense. South America offers an excellent market for American pure bred livestock, and during 1920 this trade amounted to nearly $700,000 as a result of efforts of the department of agriculture in cooperation with individuals and breed associations.

Recently, however, there has been a marked increase in trade of this sort and correspondingly greater interest on the part of American breeders in the possibility of further developing foreign outlets for surplus animals.

During the past three years several investigators have been sent to South America by the United States department of agriculture for this purpose, and recently a representative to act as agricultural trade commissioner, with permanent offices in Buenos Ayres, was sent to Argentina.

Among the features that the bureau's specialists urge breeders to give careful attention are the number of animals to be shipped, space on the boats, dates and hours of sailing, ports of embarkation, costs of rail and water freight, the building of stalls on boats and the proper size of stalls, the number of attendants permitted on the boats, whether attendants will be allowed free return passage, insurance, tuberculin tests, registration, viseing of documents by foreign consuls, marking, tagging and photographing the animals, billing, passports for attendants, equipment for caring for animals en route, feed in transit, and the quarantine regulations at port of arrival. In addition at least eight different documents such as tuberculin test, general health, registration, service, transfer and export certificates must be obtained and each properly filled out and authenticated.

These points are but some of the important features in the foreign marketing process. There are also numerous features of lesser importance, yet none of which can be slighted if success is to be secured. The bureau of markets has made extensive investigations of the various mechanical steps necessary in exporting livestock abroad, including approximate costs, information that is available to American breeders upon request.

The Highest Price Ever Paid in California

for ownership of a Holstein sire was for a son of Miss Valley Mead De Kol Walker, 36.80 lbs. butter in 7 days at 3 years of age, 1113.57 lbs. butter in 365 days. She held the world's records in three different classes for production and is without doubt one of the greatest individuals ever bred in the state.

The Highest Price Ever Paid for a Half Interest

in a Holstein sire in California was for another son of the same cow.

Of the six leading herds in Southern California headed by sons and grandsons of this great cow, only one has HER GRANDSON, HER BROTHER FROM THE SAME WORLD RECORD DAM, AND A BROTHER OF THAT DAM.

Los Angeles County Farm
Hondo, California

PLAN SCABIES CONTROL

That the scabies situation in California and Nevada is extremely serious and can be controlled only by the concentrated effort of stockmen, state and federal bureaus, is the statement made by Paul G. Redington of the U. S. forest service. At a recent meeting of the interested departments the following plan was agreed upon:

California and Nevada will cooperate to the fullest extent. Nevada inspectors will be deputized to exercise their authority in California, and vice versa. A similar arrangement will be in effect between California and Oregon. Particular attention will be given that part of California including the recent addition to the Modoc national forest, where sheep come into California from Oregon.

Federal and state inspectors will pass on all the sheep to be grazed within or trailed across the national forests in this district. All forest service sheep permittees must present a certificate from either a federal or state inspector showing that their sheep are clean before they will be allowed to enter the national forests. If the sheep are clean certificates "good for admission to the national forests" will be issued by both state and federal inspectors. Sheep which cross the national forests must be accompanied by a certificate.

Sheep exposed after dipping or inspection will be refused admission to the national forests until they can be inspected and passed.

Sheep which develop scabies after they enter the forests will, if possible, be isolated pending proper dipping.

POSSIBILITIES OF TUBERCULIN TEST

It is well at times to give attention to what can actually be accomplished with the tuberculin test when it is intelligently used and what valuable information may be obtained.

The following results were obtained by the California department of agriculture: In one county not a single cow that passed the first general test reacted to the second test. In another county but three herds were found affected and in each case the disease was traceable to outside sources. In still another county not a single reactor has been found due to its geographical isolation, while in an adjoining county where transportation and communication to the outside is easy it is well known that large numbers of tubercular cattle are present. In addition to these facts there are many herds in various parts of the state that have been entirely freed from the disease by the test.

HOW TO FAIL IN A DAIRY

Sometimes the best way to show how to do a thing is to tell how it should not be done. Then the way to succeed will be clearly evident. With this plan in view a West Virginia farmer gives some rules on how not to succeed with cows, a copy of which has just been received by the United States department of agriculture. The farmer humorist says:

Don't weigh your milk, for then you might have to figure and think.

Feed the cows timothy hay—it is good for race horses.

Cow testing associations are needless—they show how to save and know.

Keep the barn hot—cows are like woodchucks.

Don't have many windows in the barn—the hired man might look out.

Keep water ice cold—shivering gives the cows exercise.

Avoid heavy milkers—they consume too much valuable time.

DAIRY MEETING TO BE HELD APRIL 23

The dairymen's department of the Los Angeles County farm bureau has set the date for their big dairy meeting and picnic for Saturday, April 23. This meeting will be held at the Pellissier ranch at Whittier and will be one of the biggest meetings the dairymen have had, numerous things of interest being taken up at this time. One of the most important will be the starting of a campaign on the control and eradication of tuberculosis in dairy cattle. Dr. J. P. Iverson, chief of the division of animal industry of the state department of agriculture, will be present to outline his plans for this work. The dairy department expects to cooperate in control of tuberculosis and will undoubtedly adopt a program for this work. The dairymen will also be given an opportunity to test their ability in selection of dairy animals.

Recent sales of Anchorage Farm Berkshires include two sons of their grand champion boar, Natomas Baron Duke to H. G. McFessel, Arbuckle and C. F. McBride, Gazelle. A gilt bred to Natomas Baron Duke went to B. A. Fyle, Rogue River, Oregon. Mrs. Hardy, manager of the farm, reports a decided increase in inquiries for breeding stock.

Dispersal of
The Great Toyon Herd

135 Registered Holsteins 135

TOYON FARM

LOS ALTOS, CAL.

APRIL 20-21, 1921

A Few Attractive Features That Mean Dollars and Cents to the Wise Buyer:

THIS IS THE ONLY HERD under Federal supervision for health in California.

THIS SALE contains more of the blood of the famous sire SIR PIETERTJE ORMSBY MERCEDES than was ever before offered in a western sale, and it is close up to him, granddaughters and grandsons, greatgranddaughters and greatgrandsons.

THIS SALE contains more high yearly record breeding, in the records of females themselves, the records behind them on one or both sides, and the services carried by many of the females, than is usually found in any sale, anywhere.

FEMALES WITH YEARLY RECORDS UP TO OVER 1000 POUNDS BUTTER!

FEMALES WITH 7 DAY RECORDS UP TO OVER 30 POUNDS BUTTER!

A DAUGHTER OF THE FAMOUS 30,000 POUND 4 YEAR OLD, CASCADE FLETA JOHANNA!

A DAUGHTER OF THE $12,000.00 BULL KING KORNDYKE PONTIAC 20TH, OUT OF A 30 LB. DAUGHTER OF KORNDYKE QUEEN DE KOL'S PRINCE!

DAUGHTERS OF 1000 POUND YEARLY RECORD COWS AND 30 POUND 7 DAY RECORD COWS!

SONS OF COWS WITH UP TO OVER 1000 POUNDS BUTTER IN ONE YEAR AND UP TO OVER 30 POUNDS BUTTER IN 7 DAYS!

NO MATTER WHAT YOUR NEEDS, WHETHER FOR FOUNDATION FEMALES OR A REAL HERD BULL, YOU WILL FIND A GOOD SELECTION IN THIS SALE.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested by a Federal veterinarian and sold subject to retest by the buyer.

TOYON FARM is about 20 miles northwest of San Jose, about 8 miles southeast of Palo Alto.

Headquarters of sale will be Hotel Montgomery, San Jose. Make your reservations early as this hotel is usually full.

Are Twin Calves Barren?

Is there any truth in the information that I have just received that a cow having twin calves, where one is a bull and the other a heifer, neither could be used for breeding as they would both be barren? — Subscriber, El Cerrito.

While this statement is not entirely new to our ears we have never heard it made by anyone who could back it with definite knowledge. There may be historical data on the subject but not that we know of. We do know that it does not hold true in the human family because we know several brothers and sisters (twins) that are both parents of beautiful children. Candidly we do not believe there is anything in the statement. The old saying that "like begets like" holds good usually in regard to numbers as well as to traits and forms. We would be more inclined to think that they would be good breeders and more likely to bear twins than others. We would like to hear from those who know.

Rabbits Ailing

I have four New Zealand nursing does that are troubled with wet tails. They seem perfectly well otherwise, having a good appetite. Their quarters are comfortable, clean and light and no draft nor anything disquieting can get to them. Their rations consist of cooked oat meal (salted) mixed with rolled barley, alfalfa hay and some green feed. Water is constantly before them. Have tried putting spirits of niter in the water but it is of no avail.—Subscriber, Los Angeles.

You seem to understand the rabbits and are giving them extra good care. We believe the whole trouble is due to your cooking and salting the oat meal. A little green feed and some carrots or beets are very good, but cooking food or giving too much green feed is too laxative. Clean hutches, clean water and dry feed seem to agree with rabbits. If you wish to hasten the growth of the little ones give them a little cow's milk on the side.

Sheep Shedding Wool

My sheep have all shed their wool during the last few weeks. They are fed green feed, dry alfalfa hay and grain. They also have access to water and salt. They are in the same pen with the hogs. What is the trouble and what is the remedy?—Subscriber, Tulare.

First, we do not believe it is good for sheep and hogs to run together. The trouble is probably due to a mite in the skin. Would advise dipping them in a solution of zenoleum, using half a teacup of the zenoleum to a bucket of water. Dip them again in about a week. Sheep often suffer from liver trouble at this time of the year and need something bitter that will arouse a healthy action of the liver. They like dried thoroughwort as well as a cat likes catnip. It is very bitter but they like it so well they will fight for it. About the best thing you can get for them is aloes. Dissolve an ounce of aloes and two ounces of hard soap in a quart of hot water and sprinkle it on the hay for a dozen sheep. A few doses like this every spring will improve the sheep enough to pay well for the trouble.

Barley Beards

My horse has a place on the side of the throat that has been open and running for about two years. The discharge is very offensive. Have lanced it and used disinfectants but it does not heal. What is best to do for it?—Subscriber, San Jose

When barley beards work through it develops just such a case as you describe. The discharge is always very offensive. Probably there is still an opening inside that allows a few beards to enter occasionally, and probably there is a pocket between that and the outside opening, at one side of the canal, that is full of beards. The outside opening should be enlarged and the place cleaned out. If you can find the place where it opens inside it should be scraped, then it will heal. Then by washing out the cavity once a day with a solution of permanganate of potash, 20 grains to the pint of water, it will soon heal. If a veterinarian is near you had better get him to dress it a few times for you.

Retention of Afterbirth, Etc.

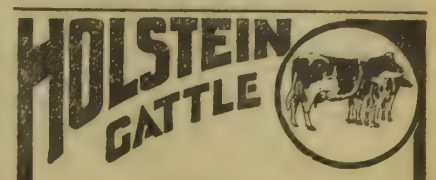
I have a cow that a year ago retained the afterbirth for two weeks after calving and became very thin in flesh and gave very little milk. She seems all right now and gives quantities of milk although she is quite thin. A swelling came on the side of her head below the ear, extending down to the lower point of the jaw. It broke and discharged freely. The opening is at the upper part of the swelling and it continues to discharge. Am wondering if it is due to barley beards or foxtail. What would you advise?—Subscriber, San Jose.

Retaining the afterbirth indicates some constitutional trouble. It may be tuberculosis, but her coming fresh again this year all right partly offsets that theory. The abscess on the side of the head would keep her thin in flesh. It may be due to barley beards or foxtail coming through from the mouth. Probably there is a pocket below the opening and it will not heal while that is there. A probe should be passed through the opening and down through the cavity until you find the bottom which will probably be near the skin. Make a large opening there so it will have good drainage. Wash it out once a day with a warm solution of permanganate of potash, 20 grains to the pint of water, syringing the solution in it at the top and being sure it all comes out at the bottom. It should heal very soon after you give it good drainage. If you do not feel like doing it yourself get someone to do it for you who is familiar with such work.

NINETEEN YEAR OLD GUERNSEY MAKES RECORD

Phebe D. of Maplelawn, a Guernsey cow almost 20 years of age, owned by J. H. Seaman, Glens Falls, New York, has recently completed an Advanced Register record of 7,467.2 pounds of milk and 416.7 pounds of butter fat. She is the oldest cow of the Guernsey breed to complete an Advanced Register record. Her exact age at the beginning of her record was 18 years and 7 months. Phebe D. of Maplelawn has another record of 9,891.63 pounds of milk and 522.98 pounds of butter fat, which was completed two months before she reached her fifteenth birthday. The first calves from this remarkable cow were not registered and records concerning them are not published. Beginning in October, 1909, she has dropped a calf on an average of each 13 months, with the exception of the year 1918.

Beaver in the Salt River are doing so much damage to trees that a special permit has been granted for trapping them in certain districts of Arizona.



C. W. Newman, Prop. Merryall Farms, Wyalusing, Pennsylvania, writes:

"Holstein cattle have been the real foundation for my financial success. From an original investment of $75 in one purebred female I have in twelve years sold $3,840 of stock, and have six valuable animals on hand."

FIRST INDIVIDUAL PUBLIC SALE

60——REGISTERED HOLSTEINS——60

Santa Anita Rancho OWNED BY ANITA M. BALDWIN Santa Anita, Cal.

TUESDAY, APRIL 26, 1921

The herd at Santa Anita Rancho has multiplied itself from a splendid foundation to a size larger than the Rancho will at present accommodate, and a reduction in numbers will be made through this, the first individual public sale of this famous breeding establishment.

The highest record cows in the herd are included in the sale list, as well as daughters of many of them sired by the great bulls that stand at the head of the herd.

Breeders generally are familiar with the high character of the breeding operations at Santa Anita Rancho, and the especial care that has always been exercised in the matter of breeding animals sold, with the view of building up a steady patronage of satisfied buyers.

Besides the wonderful individuals that comprise the sale list, an outstanding feature of the offering is the fact that a considerable number of the high class females carry the service of the $41,000.00 bull King Korndyke Pontiac Acme, one of the very greatest young sires the breed has yet produced.

THE LIST OF FEMALES INCLUDES:

A 34 POUND granddaughter of King of the Pontiacs, now on yearly test.

A 17 POUND 3 YEAR OLD daughter of Prince Gelsche Walker, out of a 656 lb. yearly record granddaughter of King of the Pontiacs.

A 20 POUND JUNIOR 3 YEAR OLD daughter of Merci Lad Korndyke Burke, out of a 738 lb. yearly record 4 year old, second dam a 919 lb. yearly record cow. Will be fresh before sale.

A DAUGHTER of Merci Lad Korndyke Burke, out of a 905 lb. yearly record daughter of a 1003 lb. yearly record cow. Heavy with calf to Prince Walker Cornucopia.

A DAUGHTER of the above cow by Prince Walker Cornucopia.

A 19 POUND JUNIOR 2 YEAR OLD daughter of Merci Lad Korndyke Burke, now on yearly test and will finish before sale with around 22,000 lbs. milk, bred to Prince Walker Cornucopia.

A DAUGHTER OF MERCI LAD KORNDYKE BURKE out of a 21 lb. granddaughter of King Segis Pontiac. Heavy with calf to Prince Walker Cornucopia.

TWO DAUGHTERS of the above cow, full sisters by Prince Walker Cornucopia, one of them bred to King Korndyke Pontiac Acme.

A DAUGHTER OF PRINCE WALKER CORNUCOPIA, out of a 21 lb. 4 year old daughter of the 36 lb. cow Alba Sadie Cornucopia Creetia.

THE LIST OF BULLS INCLUDES:

MERCI LAD KORNDYKE BURKE, the senior herd sire. He is by De Kol Hengerveld Burke, and out of Winnie Korndyke Cornucopia De Kol, 1201.06 lbs. butter from 31,034.2 lbs. milk in one year. She was the first cow to make 1200 lbs. butter in California, and her combined milk and butter production was a world's record when made. This great sire was Grand Champion at 1920 California State Fair, and has a splendid list of proven daughters, all under mature age, one of them with over 30 lbs. butter and over 600 lbs. milk in 7 days as a junior 4 year old.

PRINCE WALKER CORNUCOPIA, one of the junior sires. He is by Prince Gelsche Walker, whose splendid worth as a sire is too well known to require further comment here, and out of Alba Sadie Cornucopia Creetia, the noted cow that has twice made over 34 lbs. butter in 7 days, her best record 36.18 lbs., and she made 866.28 lbs. butter from 18,848.4 lbs. milk in one year. She is a daughter of Sir Sadie Cornucopia, son of Sadie Vale Concordia, the first 30 pound cow, and rated as one of the breed's great foundation cows. PRINCE WALKER CORNUCOPIA is the highest record son of Prince Gelsche Walker, is a high class individual, with a splendid lot of young daughters, and is just now 4 years old. He would positively not be sold except for the fact that in the reduction of the herd the entire service can be handled by King Korndyke Pontiac Acme.

A SON OF PRINCE WALKER CORNUCOPIA out of a daughter of the $12,000.00 bull King Korndyke Pontiac 20th that has just finished a yearly record of 635.2 lbs. butter from 15,677.7 lbs. milk made at 19 months of age.

A SON OF PRINCE WALKER CORNUCOPIA out of a 35 lb. dam now on yearly test.

A SON OF PRINCE WALKER CORNUCOPIA out of a 28 lb. dam.

A SON OF PRINCE WALKER CORNUCOPIA out of a 19 lb. junior 3 year old daughter of Prince Gelsche Walker.

A SON OF PRINCE WALKER CORNUCOPIA out of a 19 lb. junior 2 year old daughter of Merci Lad Korndyke Burke now on yearly test.

OTHER SONS OF PRINCE WALKER CORNUCOPIA out of dams with records up to over 22 lbs. butter in 7 days as 3 year olds.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

SANTA ANITA RANCHO is about 5 miles east of Pasadena, on two boulevards.

TURKEYS

Turkeys — "Goldbank Boy." Champion Giant Bronze young tom. First Prize Cockerel at the New York, Madison Square Garden Show, the premier show of America, with 4311 poultry exhibits, held January 18th to 22nd, 1921, has just been imported by us, arriving at our mountain ranch February 26th. His sire, "Goldbank VIII," was grand champion at the same show, winning first in Cock class. We have mated this young champion bird to a limited number of twenty and twenty-one pound fancy, highly colored, eastern bred hens, also just imported. No eggs of this strain for sale this season at present.

A thirty-six pound yearling son of "Copper King V," the famous thirty-eight pound yearling giant bronze grand champion of the 1919 Madison Square Garden Show, will head our other flock—having mated him to our choice twenty pound hens. Egg prices reasonable. Two young toms of this last strain on hand for immediate delivery. For further particulars address: Bronze King Mountain Farm, Box 308, Calistoga, Napa County, California.

Large Number of Choice Bronze Toms and hens, also geese and herding Collie Dogs. Shipped from St. Helena and San Miguel. John G. Mee, San Miguel.

"Goldbank" Strain — Giant Bronze turkey toms. Partridge Plymouth Rock chickens. Chicken and turkey eggs in season. M. M. Reiman, Planada, California.

For Sale—White Hollands, Quality, Size and Vigor. Tom $12.00; eggs 50c each. Blue ribbon flock header. L. A. Robinson, Hemet, California.

Bourbon Red Turkeys, Buff Ducks, Buff Orpingtons. The Ferris Ranch, Reservoir St., Pomona, California.

Mammoth Bronze Turkey Eggs 30c; R. I. Red and Black Minorca eggs 10c. W. Duvall, Franklin Avenue, Pomona, California.

FARM LAND FOR SALE

CALIFORNIA IRRIGATED LANDS Irrigation plus California climate eliminates chance in farming. Let us tell you about Safe Farming on Sutter Basin Irrigated Bottom Lands. Write for literature to Land Department, SUTTER BASIN COMPANY, California Fruit Building, SACRAMENTO, or to W. L. White, 609 Balboa Building, SAN FRANCISCO, or to C. D. Saunders, 509 Security Building, LOS ANGELES.

To Close an Estate—12 Acre Orange Grove 11 years old. Finest condition; on paved streets in the fastest growing city in California. Land alone worth price asked. Price $1,500 an Acre Cash. Address: E. B. Sellars Real Estate Co., Exeter, California.

For Sale — 20 acre date garden, ¾ mile Indio. Best date growing section. Coachella Valley. E. A. Miller, Box 192 Indio, California.

For Sale — Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California

5 Acre improved irrigated ranch, alfalfa, oats, orchard and berries, R. D. 1 Box 4, Los Molinos, Calif.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Settlement on Partner's Death

I have a lease on crop shares. I have a partner who shares with me. In case of death does my wife get my portion or does the partner succeed to all of it?—Subscriber, Bridgeville.

In case of the death of the partner the partnership business is wound up by the surviving partner, who must account to the estate of the deceased partner for his interest. He is required to wind the matter up without charge to the estate. The wife, if she is the sole heir to the estate, would, therefore, receive the net interest of the deceased partner.

Soldier's Exemption

Does the exemption from taxation for military service of $1,000 apply to personal property, to real property, or to both? I was honorably discharged from the navy in 1912.—Subscriber, El Centro.

The exemption applies to either real or personal property, but it applies only to veterans of wars in which the nation has been engaged. It, therefore, does not apply to a person who was honorably discharged from the military service in time of peace and had no service in time of war.

Private Telephone Wire

A telephone line runs diagonally across my property. The line chafes a young cherry tree. Is the owner required to move the line or am I required to trim the tree?—Subscriber, Stockton.

In the ordinary case, such as the above, either the wire has been run across the field by the license of the owner or merely through carelessness. In either instance owner may revoke the license and require the owner of the telephone line to take some other route. If the owner of the telephone line purchased the right of way and has a grant therefor, the owner cannot, of course, intrude upon his grant and would be obliged to protect his trees accordingly.

HENDERSON REMAINS PRESIDENT OF MILK PRODUCERS

Following the adoption of a resolution by directors of the Northern California Milk Producers Association in which J. M. Henderson, Jr., was asked to reconsider his resignation as president of the association, Henderson announced he would remain at the head of the organization. The resolution, which was adopted by unanimous vote, follows:

"Whereas, It has been stated in the public print that J. M. Henderson contemplates retiring as the active head of the Northern California Milk Producers Association, and it is believed by the members of the association undersigned that it will be a great loss to the association and the dairy industry generally, if Mr. Henderson shall retire from the active leadership of the association, and we keenly appreciate the sturdy defense Mr. Henderson has made against the incessant attacks upon the association and has without flinching successfully withstood personal criticism and assaults upon his own honest intentions and purposes in connection with the association, which criticism and assaults, if they had had any basis in fact would through their persistency and virulence, have shown any wrongful, improper or selfish motive or act on his part, and we have the fullest confidence in Mr. Henderson's high and patriotic motives in all his ability and integrity. Now, therefore, be it resolved, that we extend to Mr. Henderson an expression of our most profound thanks and appreciation and that we most earnestly request him to reconsider his expressed desire to retire from active leadership of the Northern California Milk Producers Association."

Elmer McNear of Dixon and L. S. Torrey of Arbuckle have been chosen new directors of the association.

TEAGUE TREES

Ask the man who has planted them and he will tell you that Teague Trees are unequaled in growth and productiveness.

They are the best that can be produced.

If you intend planting CITRUS TREES it will pay you to come and see our stock and let us figure on your requirements while we still have a good assortment to select from, as the supply of good trees is limited.

Avocados, Feijoas and other Tropical fruit trees in all of the recommended varieties.

Send for our new descriptive price list and tell us what you intend to plant.

ADVENTURING WITH CHICKENS

(Continued from Page 511.)

this house, never to come out till they have served their time as layers and are ready to go to market for potpie. He is going to raise the whole bunch at once around one of the big brooder stoves. "I haven't time to nurse them," said Will with a grin. "I'm a farmer, not a poultryman, but I've raised a thousand chicks that way more than once. I ought to save 90 per cent of them, and my time is worth more than the other hundred."

That is one way to look at it. For my part, I shall be ashamed if I cannot raise 95 per cent out of every 100 chicks.

January 29.—I was interrupted here by a telephone call from the breeder who was to send us our chicks the tenth of February. He said an order had been cancelled, leaving him with 500 on his hands. If we could take them the next day he would make us a little reduction in the price. Would we? Why not? The house was ready, brooder and heater installed, straw on the floor, and a warm January sun streaming in at the windows. "Bring them along," I cried, and rushed to tell Bob.

That was a week ago, and we still have 450 left of the 500 chicks, but some of them look rather "peaked," as Grandma used to say. Pride, I fear, had to be punished.

They were the loveliest things when they came, not a droopy one in the lot. I hustled them into the brooders, 100 to each, and Bob watched the thermostats. That night, according to the book, they should have had nothing to eat. "The yolk of the egg, which they take into their intestines the last day in the shell is sufficient food for three days." I know it by heart, you see. Well, I fastened them in under the hover and left them there a while, but presently two or three found their way out, and it wasn't long till every chick in every one of the five brooders was out in the playroom. They looked hungry to me and I ran over to Mrs. Doolittle. "I don't know," she said. "I always feed them myself at the end of 48 hours, but the man who wrote the book ought to know." "What I don't know is," I argued, "how long the oldest have been out of the shell. I understand they were kept in the incubator two whole days after the hatch was over. That would make those that came out first nearly four days old. I think they ought to be fed."

The upshot was that I ran back to the brooder house and scattered bulk rolled oats, the kind we used to have for breakfast at home, over the sand in the playrooms. They ate a little but not enough to hurt them, and I fastened them back under the hover.

Next morning when I went to give them their breakfast of chopped hard boiled egg mixed with bread crumbs and rolled oats I saw two or three in each brooder standing around without much enthusiasm for eating, and the next morning there was a dead chick or two in each and a few more droopy chicks. This morning I found 12 dead and tonight I am afraid I shall lie awake dreading what the morning may disclose. Mrs. Doolittle came yesterday and gave them the once over. She says she thinks the trouble is not in the feeding but in the heating. Her theory is that if food is put before the chicks 12 hours earlier than they are supposed to be ready for it, they will not eat. She says chicks never do eat till they are ready, and that all this talk about not feeding them before the yolk is digested is pure buncombe.

Tom kept the heat in all the brooders at 95 degrees, according to the book, but we noticed some of the chicks peeping that first night. I thought it was because they were babies, but Mrs. Doolittle says chicks never cry if they are perfectly comfortable. The thermometer, she says, is no guide at all to go by, because while some of the chicks may be hardened enough to bear as low a temperature as 95, there are others that need 105, and it is better to give more heat and let those that don't like it come out from under the hover a little if they wish. "When you see them all lying around, under the hover and outside of it, and sticking their heads out as if they wanted a breath of fresh air, you know they are warm enough, no matter what the thermometer says," is her dictum. "You can't raise chicks by rule any more than you can babies."

Verily, when you once begin to ask for advice you get loads of it. I had another visitor yesterday, a Mrs. Moore who lives down the street toward the car line. She has had a lot of experience and she says she makes it a rule to run the heat up to 105 the first few days just at bedtime. She says chicks always feel the chill of evening just as we do, and if they are thoroughly warmed when they go to bed they will sleep better and be in no danger of chilling later. It is on the same principle as our taking a hot water bag or stove lid to bed with us. When our feet get toasty warm we can kick the hot water bag ers. Mrs. Moore runs the heat up for an hour and then lets it drop to 95 or lower for the rest of the night. out of bed and throw off the top cov- Indeed, she is very soon able to let it go a good deal lower at night and to turn it off entirely during the day. "The sooner you can get chicks used to doing without heat," she says, "the better for everybody. Keep them thoroughly warm the first four days, then drop the temperature as fast as you can."

Why four days? Neither she nor Mrs. Doolittle could tell me, though they agree that those first four days are critical. If the chicks have not been chilled before that time they are not likely to be. They may, to be sure, get coccidiosis, or aspergillosis, or mites, or lice, or bronchitis, or roup, but they will not die of chill.

Well, we live and learn. I have 450 of my 500 chicks left, and I am going to keep them if I have to sit up with them all night. I keep telling myself:

"'Tis better to have tried and failed
Than never to have tried at all."

With love to all the folks, your chastened Bessie.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, March 28, 1921. Report for week ending March 27:

In the twenty-first week of the egg laying contest at Storrs the 1,000 hens produced 4,760 eggs, or a yield of 68 per cent. This is an increase of 486 eggs more than last week's production, 431 eggs more than for the same period last year and 633 eggs more than for the six year average.

A pen of White Leghorns owned by Hollywood Farm, Hollywood, Washington, was an easy first for the week with a production of 59 eggs.

The four leading pens in each of the principal varieties are as follows:

Plymouth Rocks

W. H. B. Kent (Barred), 744; Rock Rose Farm (Barred), 633; Ernest W. Picker (Barred), 615; Jules F. Francais (Barred Rocks), 533.

Rhode Island Reds

Charles H. Lane, 842; F. S. Chapin, 770; H. S. Bickford, 760; Deer Brook Poultry Farm, 711.

White Leghorns

James O. Le Fevre, 766; A. P. Robinson, 735; L. E. Ingoldsby, 701; Lion Head Poultry Farm, 685; Hollywood Farm, 685.

Other Varieties

Obed G. Knight (White Wyandotte), 846; H. P. Cloyes (Buff Wyandotte), 678; A. E. Hampton (Black Leghorns), 516; Harry D. Emmons (White Wyandottes), 454.

Poultry Queries

Conducted by Jean A. Koethen

Making Chicks Roost

Kindly tell me how to make young Leghorn chicks go on the roost. Mine were hatched February 13 and are old enough to roost. I had 150 in a brooder, but they were overcrowded and I have not been able to wean them satisfactorily.—Subscriber, Santa Ana.

The best way I have found to make young chicks roost is to put them in the house or coop a little while before they are ready to roost, not attempting to make them roost, but putting them to bed in comfortable boxes under the roosts, with straw under and a blanket or quilt or burlap sack over them. As soon as they are ready they will go on the roosts at night without any urging, but before this you

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote—"Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa.—"Not a case of white diarrhoea in three years." C. O. Petrain, Moline, Ill.—"I never had a sick chick all last season." Mrs. Wm. Christiana, Olive Ridge, N. Y.—"Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and $1.50 pkgs. Baby Chick Book FREE.

will find them working their way out from under the cover. When you go to the coop at bedtime and find all the chicks on top of their blanket instead of under it, you may know they are ready to roost. Never force them. Keep them warm as long as they need warmth and let them roost when they wish to. If you have a droppings board or solid, clean floor under the roosts in your little house I think you will find some way of keeping the chicks warm there without the bother of putting them in boxes. Put plenty of straw under them and fix some kind of frame to hold their covering. A hover made of strips of felt or flannel tacked to a thin board would answer nicely.

Prevent Precocious Production

My pullets five months old are beginning to lay. How can I delay maturity and keep them from laying peewee eggs?—Subscriber, Riverside.

You cannot keep them from laying some peewee eggs, but you can delay maturity by discontinuing the laying mash for a month and substituting a maintenance mash of bran and bone meal, 95 per cent bran and 5 per cent bone meal. After a month let them have the laying mash again.

Poultry Doctor Book

Can you tell me where I can get a good reliable treatise on poultry diseases?—Subscriber, Hamilton City.

"Poultry Diseases and Their Treatment," published by the Main Agricultural Experiment Station, Orono, Maine, is the best book of the sort I know of. There is a very good government bulletin entitled "Important Poultry Diseases," by Dr. Salmon, which may be had free by writing the Department of Agriculture, Washington, D. C., and our own agricultural experiment station at Berkeley publishes a number of bulletins on special diseases, such as chicken pox, coccidiosis, and worms. Dr. N. W. Sanborn has written a little book called "The Farm Poultry Doctor," which is published by the American Poultry Advocate, Syracuse, New York, for 50 cents.

Slacker Hens

My White Leghorn hens, eight months old, seem healthy, but they do not lay many eggs, and when they do lay, the eggs have soft shells. A Plymouth Rock hen that is in this flock lays right along and her eggs have firm, hard shells. What makes the difference, and how shall I make the Leghorns lay as they should?—Subscriber, San Diego.

Are your hens supplied with grit and oyster shell? Lack of shell material seems to be a more serious matter with Leghorns than with hens of the heavier breeds. Many heavy hens will lay right along, and lay eggs with splendid hard shells, with no shell making material whatever outside of what is in their grain, but Leghorns and other Mediterraneans require more help. If your Leghorns have grit, shell, clean water and a good laying mash before them all the time, greens several times a day and a quart of mixed scratch grain at night to a dozen hens, and are free from insect pests, they will lay at this season if there is any "lay" in them. If they do not lay they are slackers and should be treated accordingly.

Chick Troubles

What ails my chicks? They seem to be in perfect health and are growing, but some of their droppings are soft and brown and others contain a reddish mucus. I feed commercial chick feed in the morning in litter, chick feed mixed with hard boiled egg or meat at noon, chick feed at night, cut alfilaria twice a day, chick mash before them till after noon. They are nearly three weeks old. How can I teach them to eat wheat and what is a fair percentage to raise out of 100 chicks? I have lost 13.—Subscriber, Lancaster.

You are keeping them too long on nursery feed. Cut out the egg and keep a growing mash before them all day. As they have been on chick feed alone so long you may have to try some smaller grain than wheat at first.

(Continued on Page 539.)

The Future of the Brood

THE first three weeks usually decides the profit or loss in the rearing of chicks. The highest death rate obtains in this period because the digestive systems of the chicks have not yet fully developed.

Blended for this critical time, OLYMPIC Chick Mash *with Dried Buttermilk* is one of the most easily digested as well as the greatest growth promoting chick rations.

OLYMPIC Chick Mash *with Dried Buttermilk* eliminates the danger of White Diarrhoea, and assures maximum assimilation of health and body building elements. For best results use OLYMPIC Baby Chick Scratch along with OLYMPIC Chick Mash, feeding each at intervals prescribed in our FREE BOOK of Poultry Feeding Instructions.

OLYMPIC Chick Mash contains Cornfeed Meal, Linseed Oil Meal, Meat Meal, Oat and Barley Flour, Alfalfa Meal, Flour Middlings and *Dried Buttermilk*. The lactic acid supplied in *Dried Buttermilk* disinfects the alimentary canal and removes dangerous irritants.

At the end of three weeks change the mash to OLYMPIC Growing Mash *with Dried Buttermilk*, and the scratch gradually to OLYMPIC Growing Chick Scratch—until at five weeks they are on a full ration. This in turn can gradually be replaced with OLYMPIC Scratch when the birds are nine or ten weeks old. About two weeks before they are ready for laying, change the mash to OLYMPIC Laying Mash.

Green and green salted hides: No. 1 heavy hides, 50 lbs. and up, 4 per lb.; No. 1 light hides, 25 to 50 lbs., 3½ per lb.; No. 1 kips, 15 to 25 lbs. 5 per lb.; No. 1 calf skins, under 15 lbs., 8 per lb.; No. 1 slunks, 10@30 each; No. 1 bull hides, 3 per lb.; No. 1 horse hides, over 50 lbs., 1.50 each; No. 1 horse hides, 40 to 50 lbs., 1.00 each; No. 1 horse hides, 30 to 40 lbs., 60 each; ponies and glues, half price; No. 1 grubby hides and skins, 1½ less; No. 2 hides and skins, 2 less; glue hides and skins, half price.

Dry flint hides—No. 1 hides, 16 lbs. and up, 8 per lb.; No. 1 kips, 6 to 16 lbs., 9 per lb.; No. 1 calf skins, under 6 lbs., 10 per lb.; No. 2 hides and skins, 2 less; glue hides and skins, half price.

Pelts—Large, long wool, 40@70 each; medium, 20@40 each; short wool and shearlings, 5@20 each.

Goat skins — No. 1 common, 10@30 each; No. 2, 5@10 each; badly damanged and small kids, worthless.

Tallow—No. 1 white and hard, 4½ per lb.; No. 2, 3 per lb.; No. 3, dark and greasy, 1@3 per lb.

Wool—According to quality and condition, 5 per lb. and up.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock April 12, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies liberal, market firm. Stocktons: Burbanks, quality poor, 1.75@2.00; few best 2.25@2.40. Idaho: Russets mostly 2.25@2.35. New potatoes: 6½@7 per lb. Sweet potatoes: Supplies liberal, market steady. Best mostly 2.00@2.25 lug. Arkansas and Texas, 7@8 lb.; jobbing sales, mostly 6½@7 lb.

Onions: Supplies heavy, market dull. Stocktons: White Globes, cold storage stock, 75@1.00; Browns, mostly 35@65 per cwt. sacked.

Garlic: Local best mostly 12@15 lb.; poorer 8@10.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock April 12, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Best doz., 75@1.25; poorer wide range.

strong. Local: 15@17 per lb. Northern: 10@13 per lb.; jobbing sales, 9@11.

Beets: Doz., 35@40; sk., 1.75@2.00.

Cabbage: Field crate best mostly 75@1.00; poorer, 60; best high as 1.25.

Carrots: Doz., 35@40; sk., 1.00@1.25.

Cauliflower: Supply moderate, field cr., best, 2.25@2.50; poorer low as 1.75; few best high as 2.75.

Cucumbers: Hothouse, best, 2.00@2.50 dozen.

Lettuce: Local field crate quality poor, 1.50@1.75; best mostly 2.00@2.25.

Peas: Local: Best 11@12 per lb.; jobbing sales 10@11 per lb.

Radishes: 20@25 doz.

Rhubarb: Crimson Winter, best bx., 75@1.00; Strawberry bx., 1.10@1.25.

Spinach: Doz., 20.

Squash: Summer, mostly 1.60@1.70; best high as 1.75.

Tomatoes: Mexican, per lug, best 3.50; repacked lug, 3.75. Much poor stock at wide range in prices.

Turnips: Per doz., 30@35; sk., 90@1.10.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.25, special packed brands 2.75@3.25.

Lemons: Supplies heavy, market dull, wide range in prices. Local: packed box 1.50@2.25, few high as 2.75, loose 75@1.00 per box, per lug mostly 40@50.

Oranges: Supplies heavy, market dull. Navels, market pack, large sizes 3.00@3.50 small low as 1.75, special brands, small sizes 2.75@3.25, large sizes 4.00@4.25. Packing house culls 25@50 per box, few best 75.

HONEY

Supplies heavy. Poor wire inquiry. Movement slow, market weak. Carlots f. o. b. usual terms; few sales White Orange Blossom 13@13½; White Sage 12@12½; Light Amber Alfalfa 6½@7; Light Amber Sage 7½@8½; White Alfalfa 7½@8½. Hawaiian White 7½; Light Amber 6; Honey Dew Honey 5.

Beeswax sacked in less than carlots, per pound, Hawaiian, light color 35; domestic, light 32@34; dark low as 26.

Producers seem more willing to sell at lower prices and supplies are cleaning up in some sections. The local demand for small lots at higher prices is helping to absorb the surplus. The new crop will probably be heavy in another month, due to the favorable season. It is estimated that approximately 10 per cent of next year's crop will be comb, but supplies are now exhausted. San Diego County reports 17,000 colonies registered now, and in thrifty condition.

GRAIN AND FEEDS

Grain Exch. price bid April 12:
Barley: Carlots, 1.26¼.

HAY

Alfalfa Growers of California report under date of April 11:

There were 380 tons received on the Los Angeles tracks the week ending April 9, with 60 tons held over as against 280 tons the week before.

The alfalfa market passed through another week without material change in receipts, demand or prices, and also without activity, the result of the still continued declining tendency of the markets for all other farm products, which is of course bound to have its influence on the alfalfa market and in fact on business in all lines.

Squaw Mountain Sudan Seed

Plant Squaw Mountain Sudan Seed, utilize your summer fallow. Ten pounds per acre, through your grain drill, will furnish green feed through the summer and late fall for horses, cattle, hogs, or turkeys.

The land may be prepared for barley or wheat in the fall by disking. You will have no stalks to contend with—the stock will eat it clean.

Plant some in the back lot for your chickens.

Plant Squaw Mountain Sudan Seed year after year. It is free from Johnson grass.

HAY AND FEED

Alfalfa Growers of California report under date of April 11:

No. 1 Dairy	19.00
Standard Dairy	17.00

Under date of April 8 A. W. Scott Co. says:

Receipts past week 1,443 tons as compared with 1031 tons the preceding week.

Excessive receipts of hay during the past week together with an extremely light demand have caused the market to rule somewhat lower in price with receivers anxious to sell and in most cases willing to accept a reduction from asking prices in order to move cars and to avoid storing. The flurries and uncertainties of grain markets have apparently caused many hay buyers to believe that the hay market may drop still lower and they will make no purchases at all unless they are entirely out and must renew their supplies. Throughout the country districts prices have been maintained and holders of hay have been apparently not anxious to reduce prices in order to effect sale. Alfalfa has been much weaker. Reports of early cuttings and consignments from Imperial Valley and Arizona points into the Southern market have greatly weakened Los Angeles prices and reflected this weakness throughout upper California as far as San Francisco.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Citrus Markets

Los Angeles, April 13, 1921.

Valencias are going forward rather earlier than usual and are commanding fair prices. Navel season is waning but the quality is exceptionally fine, and, excepting for the great number of small sizes, are being disposed of satisfactorily. Daily shipments of oranges are sometimes running as high as 200 cars. Mikes and Sweets are somewhat embarrassed by the great number of small sizes.

Lemon market indifferent and unchanged.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 16,083 cars; lemons, 3,270; total, 19,353. To same date last season: Oranges, 14,312; lemons, 2,770; total, 17,082. From Central California to date, this season: Oranges, 4,448; lemons, 127; total, 4.575. To same date last season: Oranges, 4,006; lemons, 281; total, 4,287. From Northern California to date this season. Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

POULTRY QUERIES

(Continued from Page 537.)

Cracked Indian corn and Kafir or Egyptian corn may be more to their liking, and a hopper or box of very coarse feed meal will be a help in weaning them away from the fine chick grain. Some poultrymen use the feed meal instead of mash and find it very satisfactory. If you can give the chicks a mash moistened with sour milk once a day they will grow more rapidly. Alfalfa is better green feed than alfilaria.

Five-Year-Old Granddaughter of

Pontiac Korndyke

the highest 7 days record cow ever sold at public auction west of the Rocky Mountains, is one of the features of the

Complete Dispersal

The Victory Herd

70 Registered Holsteins

Hillcrest Ranch

Carruthers, Cal.

Wednesday, May 11, 1921

This sale is necessary to dissolve the partnership existing between H. E. Spires and J. M. Crawford, and presents a very desirable herd of cattle of attractive breeding. Included in the offering are

24 GRANDDAUGHTERS OF KING SEGIS PONTIAC COUNT, the famous bull owned by Senator Hackney in Minnesota.

SIR PIEBE SEGIS PONTIAC, sire of above heifers, will sell. He is by King Segis Pontiac Count and out of a good yearly record dam.

KING PONTIAC ALCARTRA PRILLY, the junior herd sire, also sells. He is by the Bridgford three times grand champion King Segis Alcartra Prilly and out of a 36 lb. daughter of Spring Farm King Pontiac that has finished a year with over 26,000 lbs. milk and almost 1000 lbs. butter.

Guaranteed breeders and tuberculin tested.

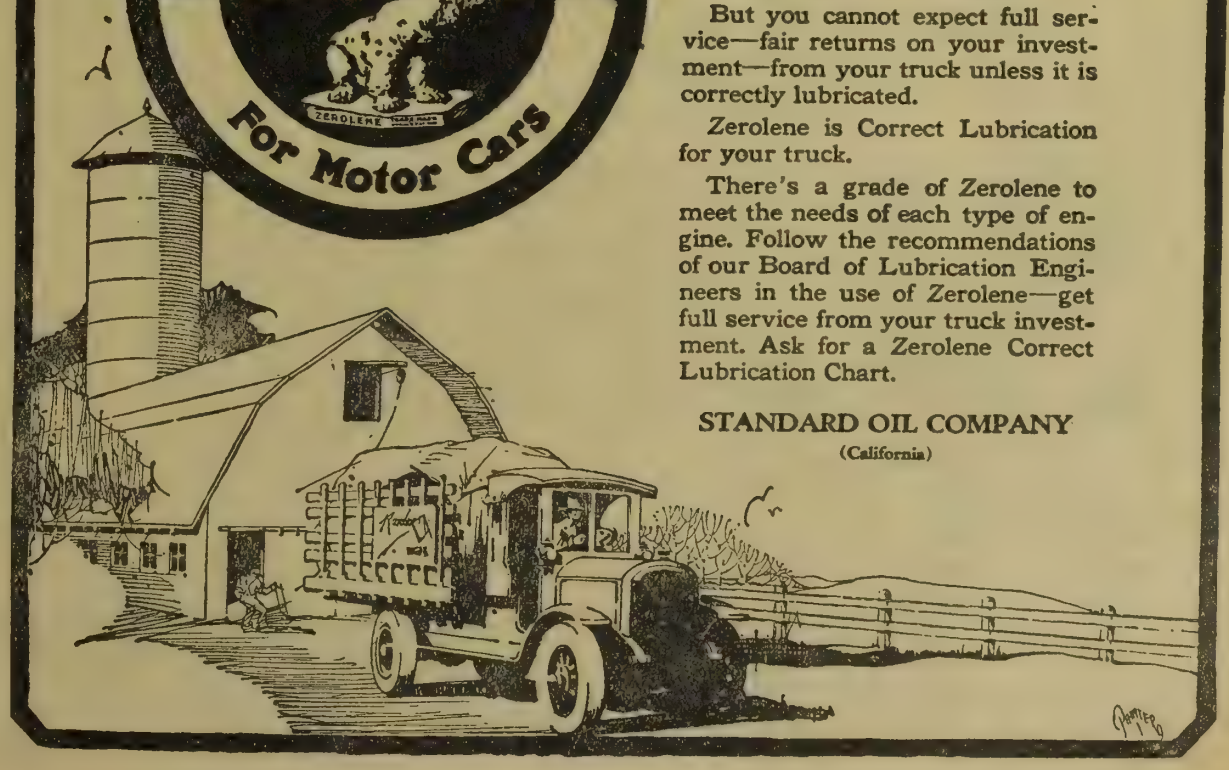
A grade for each type of engine

The Standard Oil ZEROLENE For Motor Cars



Better truck lubrication

Your truck is an investment.

But you cannot expect full service—fair returns on your investment—from your truck unless it is correctly lubricated.

Zerolene is Correct Lubrication for your truck.

There's a grade of Zerolene to meet the needs of each type of engine. Follow the recommendations of our Board of Lubrication Engineers in the use of Zerolene—get full service from your truck investment. Ask for a Zerolene Correct Lubrication Chart.

STANDARD OIL COMPANY
(California)

what do you buy—"feed or feel"?

Even the most expert poultryman can't tell the quality of a feed simply by looking at it or feeling it. Because a feed can be light or dark, fine or coarse, and yet not vary one-tenth of one per cent in net feeding value.

That's about the least important feed test in the world—texture! For example: Some wheats grind up rather coarse — others rather fine. That makes a big difference in "feel." But does it make a difference in feed value? No!

YOU can set it down as a pretty pat rule that the "feel" of a feed means *nothing*. Texture is about the least important thing in the world when you buy feed. Color is about the least important thing, too. Feed value is the *most* important thing. For *feed value* is the thing you're buying—nothing else and nothing less.

Experience has taught us that proprietary feeds cannot be manufactured in an economical way if color and texture are strictly adhered to. A change in the manufacture of different colored corns, different colored wheats, different colored sorghums or different colored meals immediately shows a change in the color of the by-products. But here's the essential point: *there's no change in feeding value.*

So, why fuss over the "feel" of a feed when the thing you're paying for — the thing your hens are praying for — is feed value? Seasoned poultrymen who use SURELAY year in and year out know this. They know that, regardless of "looks" or "feel," SURELAY is a uniform quality-feed that makes hens pay by making them lay. And that's the only test that interests them—or you!

You can't "go wrong" on SURELAY because our daily laboratory tests make sure that every batch of the feed "goes right" in the blending. That cuts out guess-work in the making and guess-work in the feeding.

Thousands of successful poultrymen have witnessed the profit-performance of SURELAY season after season. They have quit worrying over color or texture. As a matter of fact, they have quit worrying over the feed question altogether—thanks to the uniformly high standard of Sperry Feeds.

That's why we're anxious to bring *you* into the fold. If you haven't seen our booklet, "Make Hens Happy," mail the coupon for a copy of our new edition. You needn't bother to write a letter—although we're ever ready to discuss your feed-problems with you.

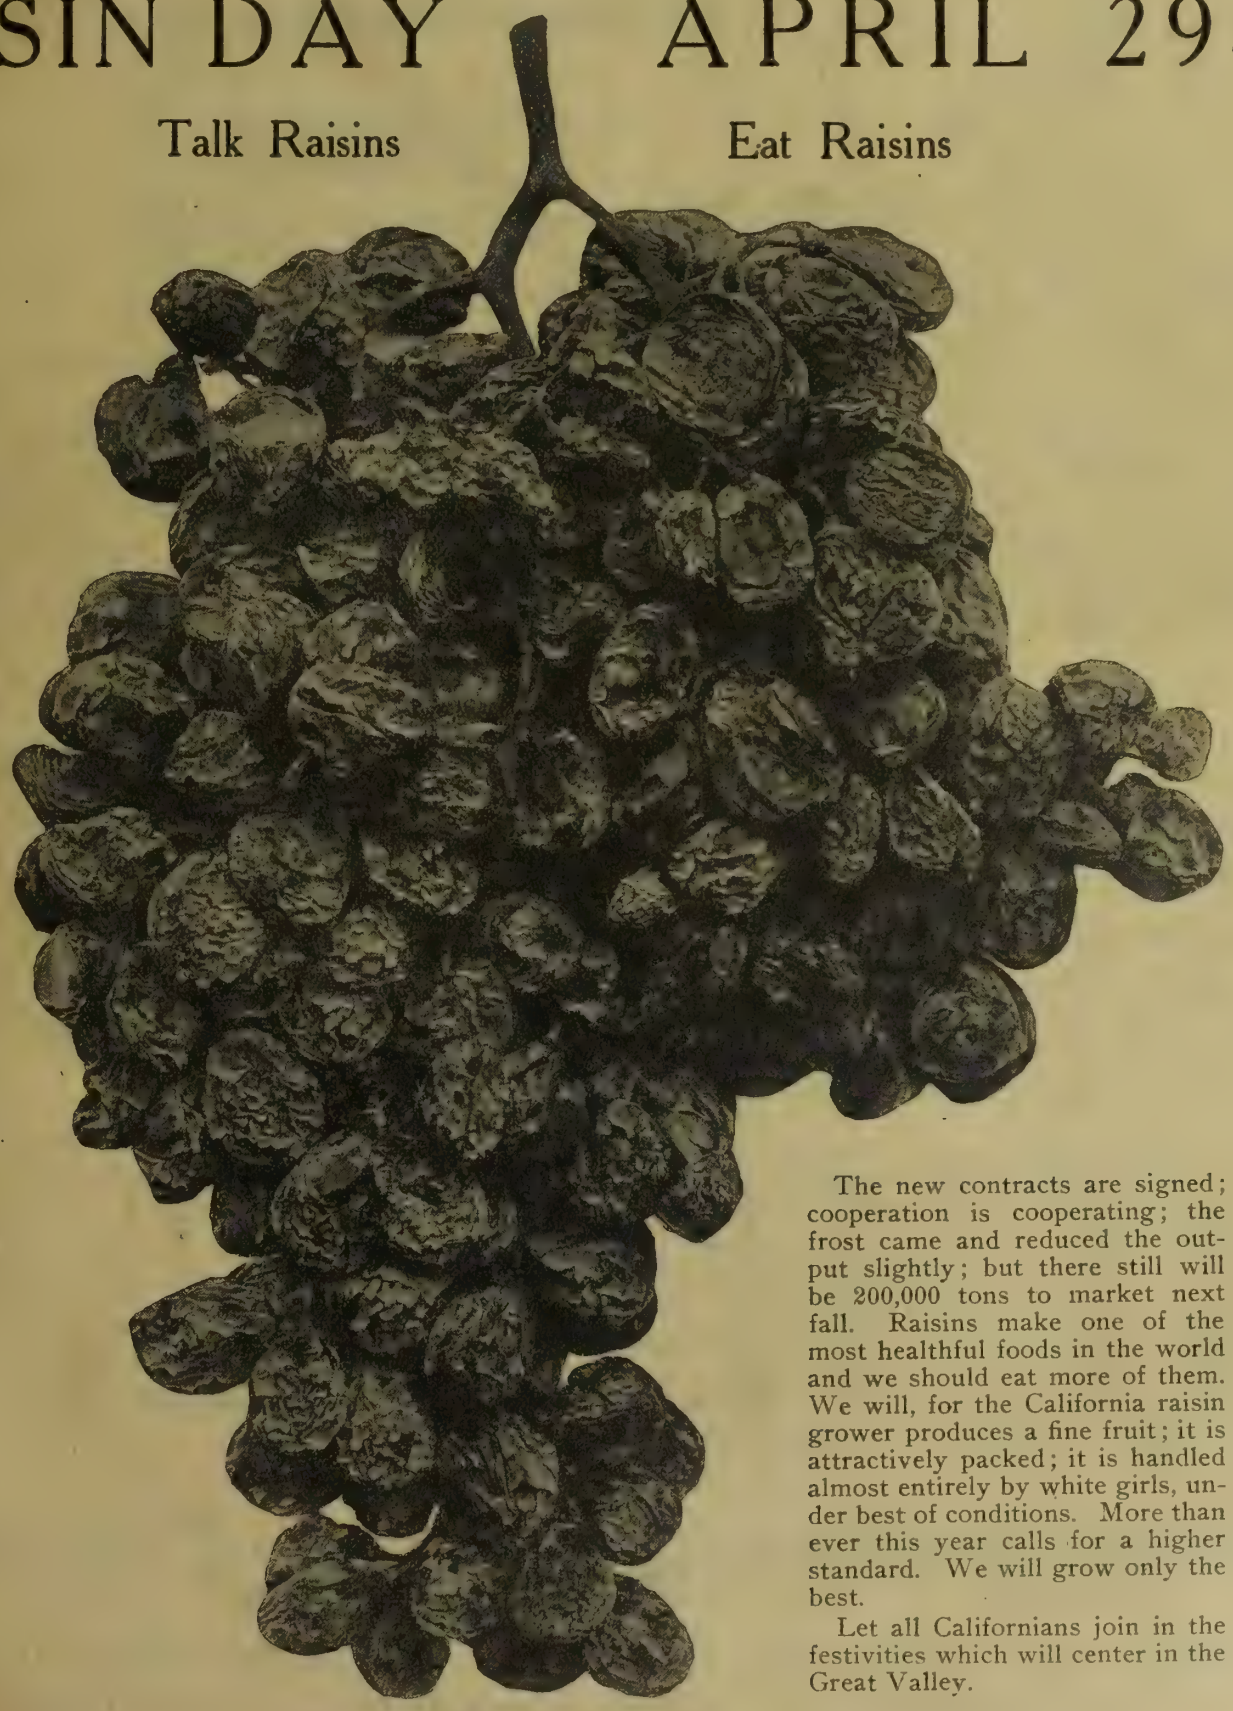
Vol. LVI — April 23, 1921 — No. 17

RAISIN DAY APRIL 29-30

Talk Raisins — Eat Raisins



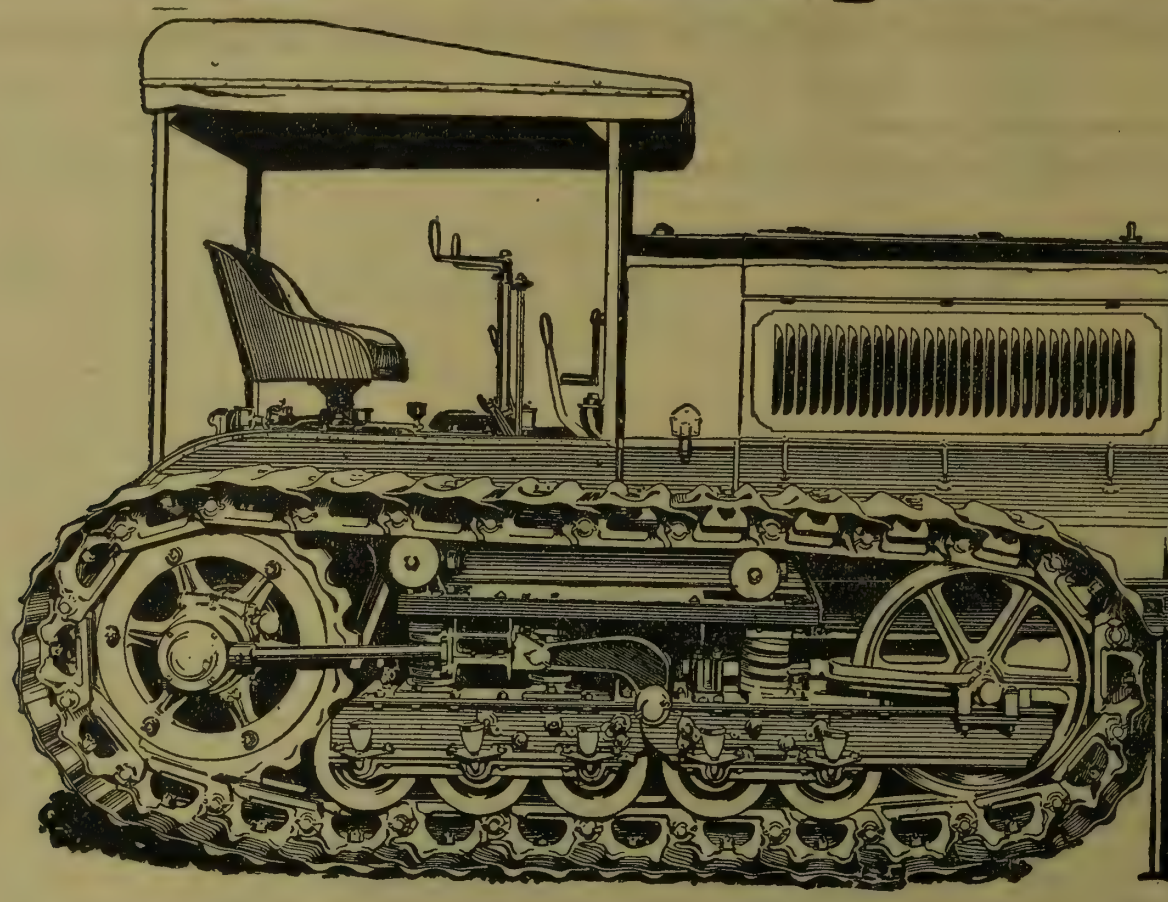
The new contracts are signed; cooperation is cooperating; the frost came and reduced the output slightly; but there still will be 200,000 tons to market next fall. Raisins make one of the most healthful foods in the world and we should eat more of them. We will, for the California raisin grower produces a fine fruit; it is attractively packed; it is handled almost entirely by white girls, under best of conditions. More than ever this year calls for a higher standard. We will grow only the best.

Let all Californians join in the festivities which will center in the Great Valley.

Tractor Values

from now on, will be measured by a new and higher standard—the standard set by the

New Western 10-Ton "Caterpillar" Tractor



A new era in tractor building is opened—a new standard of economy and performance set—by this newest Holt tractor, the Western 10-Ton "Caterpillar" Tractor. You have learned of the fame and marveled at the achievements of the famous 5- and 10-Ton models, on two continents, in every kind and condition of work. Now, in the Western 10-Ton, you have a machine particularly developed to meet your conditions.

It has liberal power—more than 60-horsepower. It has economy—its operating expense is far less than that of higher-rated tractors. It has long life and low upkeep—no other tractor can even approach the new Western 10-Ton in this respect. It is the product of Holt experience, unequalled in breadth and variety, developed along common-sense engineering lines.

If you want a tractor that is powerful, that is economical, that has wide adaptability, that is long-lived, built to the highest standards of material and construction, able to do your work, *when* you want it done and *how* you want it done, at lowest cost per horsepower hour—if you want these things, then the Western 10-Ton "Caterpillar" Tractor is your certain choice. Investigate it now, fully and carefully—the nearest Holt branch will give you complete information.

California Cultivator

Vol. LVI, No. 17 Los Angeles, April 23, 1921 One Dollar Yearly

What Will the 1921 Harvest Be?

WITHOUT question California's crops will be materially reduced this year. Even hay and grain, excepting possibly alfalfa, will show reduced tonnage. This is partly on account of heavy rains preventing seeding in the north and insufficient rains preventing full crops in the south. Then came the nippy frosts in almost every section of the state, and fruits of vineyard and of orchard have been greatly reduced. The reports directly from producers last week and on this and other pages of this week's Cultivator give better information than any comment we may make. Apricots, one of the earlier fruits, show very severe reduction.

We realize that our request for figures from the producers was made so early that close estimate of percentage of crop has been impossible. We appreciate, however, the effort of so many of Cultivator readers to give to the best of their knowledge for the benefit of all.

Geo. P. Weldon, Chaffey Union High School, Ontario, San Bernardino County

Almonds: Not grown commercially.

Apples: Just blooming; condition normal.

Apricots: Light; four days rain while the fruit was in the husk resulted in the development of the cottony mold fungus (Sclerotinia libertiana), which was responsible for the rotting of a great deal of fruit. Frost in certain sections recently seriously damaged what was left.

Cherries: Not grown commercially in this district. Have received no reports from Yucaipa.

Peaches: Local severe injury by frost; most of the district escaped and in the escaped portion condition is very nearly normal. Thrips are scarce as compared with last year. Local hail today (April 11) did slight injury.

Pears: Not grown commercially in district.

Prunes: Not grown commercially in district.

Grapes: Too early for report.

I am doing the best I can in estimating the condition of the various fruits which are grown in this district. The effect of the frost was such as to very materially interfere with the prospects in part of the district, however, in the major portion of our district the temperature ranged about freezing point during the cold nights and only very slight damage resulted.

I hope a little later to be able to give you a line on the condition of apples and grapes, but at present, while things are promising, I could not even make a guess as to what the crop will be.

J. P. Dargitz, Soulsbyville, Tuolumne County

Almonds: Not grown here. Walnuts frost killed.

Apples: Promise of full crop on most orchards. Few orchards on high ground all frozen.

Apricots: Few grown. Badly frozen.

Cherries: Few grown. Apparently unhurt.

Peaches: Most orchards 90 per cent frozen.

Pears: Promised well, but 75 per cent frozen.

Prunes: Not grown here.

Grapes: Few grown. Apparently unhurt.

The freeze of April 4 was accompanied by high cold north wind which seemed to make it worse on high, exposed points, while the lower ground frequently escaped injury—the very reverse of what we usually expect.

Paso Robles Press, Paso Robles, San Luis Obispo County

Almonds: 80 per cent. Damaged by frost on lower levels. Tonage greater than last year on account of new acreage coming into bearing.

Apples: Normal.

Apricots: Normal.

Cherries: Normal.

Peaches: Normal.

Pears: 75 per cent. Damaged by late frosts, or would have been above normal.

Prunes: 75 per cent. Damaged by late frosts, or would have been above normal.

Grapes: 70 per cent.

District would have had enormous crops but for late frosts.

California Prune and Apricot Growers, Inc., H. C. Dunlap, Field Manager.

Beginning in the north, have report of considerable damage about Chico in prunes, almonds and peaches. So far, this is the only real damage in French prunes. In all other districts Sugar prunes and Imperials seriously damaged by frosts. Too early to really estimate prune crop. Fruit just arriving at the stage now where frost, hot dry winds and other weather conditions can have very injurious effect. It will be nearly a month before we attempt to estimate prune crops at all.

On apricots we find a very considerable damage, both the result of brown rot and light setting, and also through recent frosts. This especially in the coast districts. Alameda County, extremely light setting. No frost. Santa Clara County, both frost and brown rot injurious and spotted crop condition. Will take a survey to estimate. San Benito County, 50 per cent frost damage. Monterey and Santa Cruz Counties about a 25 per cent setting. Ventura County very light setting and heavy frost damage. Crop reported to be nearly a failure. Farther south some frost damage, especially about Hemet 50 per cent loss; also, Nuevo and a few other points. Small acreage at Banning has a bumper crop. San Joaquin Valley crop also reported good. Generally state's crop in apricots light—possibly not even equal to last season.

H. H. Warner, State Department of Agriculture

Although it is yet too early to determine definitely the extent of damage resulting from the cold nights the first part of this month, the following observations are the result of a brief survey of only a few of the producing districts in Southern California made by representatives of the state and federal government.

Around the Van Nuys and Lankershim sections in San Fernando Valley the apricot crop was very badly damaged. Practically all the fruit was killed in some orchards and in others a small proportion will probably remain on the trees. In general the prospects in this section are for a very light early crop of ordinary quality and practically no fruit ripening later. The injured apricots have not yet begun to drop from the trees, but where the temperature was unofficially reported as 26 degrees on one night it is hardly possible for much of the fruit to survive.

Practically the same thing may be said of the peach crop in this part of the San Fernando Valley, although on account of the heavy set on some orchards 25 per cent of a normal crop may be expected. In the higher parts of the valley much less damage was experienced although in these districts many of the orchards have a much lighter crop than last year.

Potato vines in the Van Nuys and Lankershim sections which had attained a height of six or eight inches were frozen to the ground. These are sprouting out again, however, and it is not believed that, taking the San Fernando Valley as a whole, a material reduction in yield will result. The crop will no doubt be delayed for a week or ten days, at least, and there is some doubt as to the quality of the potatoes resulting from this serious freezing injury to the vines. There is roughly around 6,000 acres of potatoes planted in the San Fernando Valley as compared with approximately 3,000 last year.

Some slight damage to the apricots in the district east of Ontario was noted, as well as some freezing injury to peaches, but on the whole this section suffered less than some others. Undoubtedly some damage to the grapes has been done in the Wineville district, but probably the ultimate tonnage will not be seriously affected. Reports indicate that practically all of the early varieties of apples in the Oak Glen district were lost and that not over 50 per cent of the estimated yield on Rome Beauties and Stayman Winesaps will be secured. Unofficial reports from the Yucaipa section show that damage to the apples there has been overestimated but that, on the other hand, some cherries in the Beaumont district have been injured.

It is to be regretted that owing to the curtailment of funds for the U. S. bureau of crop estimates this year there is no man available in Southern California for checking up officially the extent of this frost damage to deciduous crops and the vegetable industry. Reports coming in from different sources are many and varied, but it is believed that the above information, so far as it goes, represents a fair estimate of the damage in districts mentioned.

Donald L. Currier, Horticultural Commissioner, San Benito County

Almonds: 80 per cent. Hurt by frost.

Apples: Hurt by frost. Crop may run 80 per cent of normal.

Apricots: 50 per cent to 15 per cent loss, due to brown rot; 35 per cent to frost.

Cherries: 75 per cent. Injured by frost.

Peaches: 90 per cent. Some frost injury.

Pears: 75 per cent. Have been hurt by frost.

Prunes: Looks like 100 per cent for French and Imperial; Sugar about 50 per cent; due to frost damage.

Grapes: Too early to state.

These figures may change as the season advances but are as close as I can estimate at the present time.

F. W. Waite, Horticultural Commissioner, Imperial County

Almonds: Not commercially grown.

Apples: Not commercially grown.

Cherries: Not commercially grown.

Peaches: Not commercially grown.

Pears: 100 per cent.

Prunes: Not commercially grown.

Grapes: 100 per cent.

No snow, no frosts; some damage to tomatoes by winds, also retarding cantaloupes and watermelons.

Fred G. Stokes, Horticultural Commissioner, Lake County

The frost of April 4 and 5 hit the prunes badly in some sections, but certain orchards escaped and it will take more time to ascertain the real damage.

Almonds are in the same condition, the higher levels being all right.

Apricots, peaches and cherries cut little figure as we have no commercial acreage, but on the lake side we have sufficient to fill local demand, etc.

No new apple acreage is being planted out and many old and unprofitable apple trees have been taken out and given way to Bartlett pears, of which we have a yearly heavy increase, planting out 53,322 pears this year and 60,000 pears last year; prunes, 17,000 last year, 20,994 this year.

The frost has hit the pears badly in a few places but in Big Valley and in the main big pear orchards there should be a big crop. Pears are very hardy and at present, even in those orchards where the pears have been frosted, they appear to be still growing and many should pull through.

In another week or two I shall be able to give a more definite and positive report.

C. G. Marchus, San Pasqual, San Diego County

Apricots: One-fifth crop. Our season started about ten days earlier than usual. The second and main bloom, which was nearly perfect, had just set when the frost of March 26 and 27 destroyed it completely, leaving the scattered first bloom, which was far enough advanced to escape. My neighbor, who has the early Newcastle, has a full crop, as his fruit was large enough to withstand the frost. If other sections have been injured as we have, there should be no trouble in disposing of the fruit at a fair price this year.

(Continued on Page 550.)

Agricultural News Notes of the Pacific Coast

Northern California

Alameda County farm bureau is staging evaporator demonstrations.

Woodland, Yolo County, will hold her Floral Pageant, May 4, 5 and 6.

Wool growers of Ukiah have organized a pool for marketing the 1921 clip.

Petaluma is shipping from one to two carloads of eggs a day to Los Angeles.

Chico farm center is discussing Mariout and reporting generally satisfactory returns.

In the week ending April 2 there were 20,485 dozen eggs shipped from San Francisco to Hawaii.

Berry growers of Paradise, Butte County, have organized and incorporated a marketing concern.

Work is progressing on the building for the poultry housing and feeding demonstration at Hayward.

The site of the experimental vineyards at Oakville, Napa County, will be purchased by the federal government.

The Stockmen's Protective Association gathered recently at Livermore, Alameda County. They discussed range and market.

Motorists and especially users of pumping plants and tractors are greatly relieved over the defeat of the gasoline tax measure.

Officers have been elected for the management of the annual farm products show at Hayward this fall. M. J. Madison is president.

Some farms at Delhi are still open to settlers, while others will be ready for settlement early in the autumn, probably in September.

San Francisco markets report heaviest receipts of vegetables and farm truck crops which have been seen on that market for many years.

The poultry department of the Sonoma County farm bureau has appointed a committee to encourage organization and work of poultry clubs through the county.

The weather bureau reports frost damage north of the delta region less than first anticipated; Sacramento Valley barley, wheat and oats in exceptionally fine condition.

The farm bureau of Sonoma County is determined to check the meanderings of the Russian River which cause much apprehension and dissension among owners of river lands.

The Pacific Dehydrators League has formed a permanent organization, electing J. B. Howell of San Francisco, president; C. A. Sheppard, San Francisco, secretary-treasurer pro-tem.

The farm bureau center at Paradise, Butte County, is organizing for rural fire protection. Carts equipped with two and a half gallon fire extinguishers are to be installed in various portions of the district.

L. LeRoy King, a real estate and insurance agent of Roseville, Placer County, in a complaint filed with the railroad commission asked for an order compelling the telephone company to restore to him the number under which he was listed before changing his office temporarily. He says the number was used by himself and by his father before him for many years and that the change, therefore, has injured his business.

Central California

Raisin Festival next week, April 29-30.

Santa Cruz reports good catches of salmon.

Oakdale, Stanislaus County, will celebrate her May Day picnic on Saturday, April 30.

Ceres will soon vote on an additional issue of sewer bonds.

Stanislaus County farmers are discussing wage reduction.

The annual farm picnic is being held in Davis today, Saturday, April 23.

The West Joaquin irrigation district is planning a 208,000 acre irrigation scheme.

Farm Bureau Federation motor trip will be held this year in the San Joaquin Valley.

Tulare County lemon and orange growers are making fight for fair tariff and freight rates.

Manteca cannery is running full handed on asparagus. About 30,000 cases will be packed.

The headquarters of the Santa Cruz County farm bureau is with the chamber of commerce at Watsonville.

San Joaquin Valley cotton growers are formulating a plan through which it is hoped to dispose of the 1920 holdover crop.

Santa Cruz farm center is making a fly eradication campaign. Poultrymen especially are building fly-tight manure pits.

Directors of the Turlock and Modesto irrigation districts have authorized building of workmen's camps at site of the Don Pedro dam.

Grain elevators are soon to be built by members of the Hanford, Corcoran and Stratford farm centers of Kings County at the towns named.

The Modesto Morning Herald is calling to the attention of Stanislaus people the advantages of naming county roads and numbering farm houses.

The San Joaqnin County Fair Association is planning to have some buildings erected in time to house part of the exhibits at the fair in October.

The campaign in the Turlock district for new members in the Tri-County Farm Bureau Exchange grain department will close May 1. Already over 500 have signed up.

The Prune and Apricot Growers Association has recently sent several carloads of small sized fruit to Germany and Belgium. The association reports many inquiries from abroad, especially as to prunes.

The Stanislaus County branch of the Milk Producers Association has elected J. E. Thorp, president and C. B. Hagemann of Ripon, vice-president. It is reported disturbed conditions will hereafter become peaceable.

A new center of the Santa Cruz County farm bureau has been organized at Pleasant Valley with E. A. Hitchings, director. Meetings will be held on the third Wednesday of each month at the Pleasant Valley school house.

Kern County farm bureau is holding vineyard demonstrations. Farm center meetings at Shafter, April 27; Arvin, 29; board of directors, 30. Home department meetings: McFarland, April 25; Kern-Delta, 26; Rio Bravo, Wasco and Shafter, 28.

Southern California

Coachella Valley is now harvesting nearly 2,000 acres of onions.

Sierra Madre will hold its seventh annual flower festival, April 28-30.

Southern California fair at Riverside has chosen dates October 11-16.

Banning, Riverside County, held its annual flower show, Friday, April 14.

Simi Valley, Ventura County, is building a new walnut packing house.

San Diego reports great increase in number of vessels out of that harbor.

Coachella Valley is making great plans for its date festival, October 21-23.

Lima bean growers are now getting their third payment on 1920 shipments.

Commissioner Coy of San Bernardino County is conducting rodent control campaign.

Colton, San Bernardino County, is planning for spring festival and industrial exposition.

Imperial Valley is growing about 1,400 acres of tomatoes and 2,000 acres of watermelons.

Honey bees are now busy in all orange growing sections, making orange blossom honey.

Little Bear Valley, San Diego County, is organizing the newest farm center of that county.

The San Dimas Exchange has been making many shipments of lemons to New York via Panama Canal.

Imperial Valley cotton acreage will be reduced by at least 60 per cent. Alfalfa and fruit are both coming back.

Poultrymen of Orange County are suggesting the advantages of forming a poultry department in the county farm bureau.

Notwithstanding California's great raisin production Spain shipped 22,000,000 pounds into this country during the past year.

San Joaquin Valley milk producers received 31.89 cents per gallon for milk delivered in 1920 in Fresno city, as against 28.11 cents for 1919.

The first carload of Riverside lemons shipped by water to New York, on the Liberator, has been received in good condition after a 23 day passage.

California Fruit Growers Exchange has passed resolutions commending ex-Senator Johnson's valuable aid in the effort to secure protection for citrus fruits.

Chief Quarantine Officer Strong of California and State Entomologist Mote of Arizona recently canvassed the cotton seed situation of the Imperial Valley.

Definite information as to amount of injury to the walnut crop because of the late frosts will not be available for some days yet, but some sections report serious injury.

Officers of the California citrus institute are Dr. J. T. Barrett of the citrus experiment station, president; R. S. Vaile, citrus experiment station, secretary; W. H. Fleet, Rancho Sespe, vice-president.

Imperial Valley cantaloupes will require about 11,000 cars. The largest planting in any one district is in Brawley, 6,403 acres; Westmoreland, just west of Brawley, 3,345 acres; Heber, 3,000 acres; El Centro, 2,100 acres.

The Coast and General

The cotton crop of Lower California is estimated at 80,000 bales.

D. B. Heard of Phoenix will represent the cotton growers of Arizona at the World Cotton Conference at Liverpool in June of this year.

Thirty-five miles of wire has been purchased by the state for fencing 3,200 acres of land owned by the Arizona state industrial school at Fort Grant.

A rabbit drive was conducted at Nutrioso, Arizona, by the county agent and a representative of the U. S. biological survey. About 300 rabbits were killed.

State Game Warden Joe Prochaska is introducing clams into some of the streams of Arizona where he believes conditions will be favorable for propagation.

Reports of the livestock sanitary board show that the number of cattle slaughtered in Arizona last year was 80,896, and the number shipped out of the state, 178,303.

The birth rate in Arizona for 1920 was reported as 24.4 per thousand. The death rate, excepting those who died from tuberculosis contracted outside the state, was 13.3 per thousand.

It is estimated that there are 25,000 wild goats on Guadalupe Island. These are owned by the Mexican government and in 1920 several shipments of live goats were made to the United States.

Serious damage has been done to deciduous fruits in Arizona by cold weather. Cotton planting is in progress in irrigated sections and many fields are up and the plants looking exceedingly well.

There are some 30,000 cattle in the Ensenada district of Lower California. These supply local demand for beef and a few are marketed in the United States. There is no dairying industry and the small amount of cheese made is consumed locally.

Ernest A. Leitzel of Glendale, Arizona, again claims the championship for the most cotton per acre. For 1920 his yield was a little over 1¼ bales to the acre. This is not quite equal to his record breaking crop for 1919, but is, so far as learned, the best yield for 1920.

Experimental sowings of hemp are being made in the prairie provinces of Canada. Kentucky seed has been used, but a large importation of seed from Italy will be tried out this year. Good crops of good quality have been secured in Saskatchewan, Alberta and Winnipeg.

In the Thatcher district of Arizona, where precipitation has been greatly deficient and range and stock have been in a most unsatisfactory state for months, the United tSates weather bureou reports cattle dying from lack of feed and water. Stock are still being fed in the Ft. Bayard (New Mexico) section.

Freight rates on sheep from the Arizona winter pastures to the summer grazing grounds have been reduced to 37 per cent. This was brought about by the action of the state corporation commission upon presentation of facts relative to the sheep industry by Hugh Campbell, president of the Arizona Wool Growers Association.

Grain Sorghums for California

By Geo. W. Hendry

Prof. Hendry gave in the Cultivator of April 9 directions for planting and care of sorghums in California. Below he describes a number of the best grain sorghums. Saccharine sorghums, broom corn and other members of the family will be touched upon in later issues.

THE durra varieties are less valuable than other sorghums for forage and silage production. Among the well known varieties of this group are Standard, Dwarf and White Milo, Standard and Spur Feterita, and Brown and White Egyptian corn. All of these varieties are well adapted to California conditions and produce large yields of grain under favorable conditions. These plants, varying in height from five to seven feet, have dried pithy stalks which contain a low percentage of sugar and are frequently acid. The heads of this group are ovoid in shape, possess large flattened seeds and are pendant with the exception of Feterita in which the head is erect.

Dwark Milo

Milo was introduced into the United States between 1880-85 and was first grown in South Carolina and Georgia. It came probably from Africa, but this is not certainly known. No sorghum brought since from Africa has been exactly like Milo. Dwarf Milo is a name given to the low growing strain which has been developed in the regions of scant rainfall. It has been bred for dwarf stature and erect heads by continual selection.

Average yield per acre at Davis for four years, without irrigation, has been 3,575 pounds per acre, compared with 3,041 for Standard Milo, 3,176 for White Milo, 1,015 for White Durra (White Egyptian), 3,151 for Brown Durra (Brown Egyptian), 2,909 for Feterita (Sudan Durra), 1,962 for Dwarf Black Hulled Kafir, 782 for Red Kafir, 2,404 for Pink Kaoliang and 2,542 for Shallu, Egyptian wheat.

At Kearney Park, Fresno County, Dwarf Milo has yielded 1,739 pounds per acre, compared with 1,731 for Standard Milo, 177 for White Durra (White Egyptian), 1,817 for Feterita, 429 for Black Hulled White Kafir. It is the best of the Durra varieties yet cultivated in this state and is second to Black Hulled White Kafir corn in popularity in the grain sorghum districts of the Southwest. Its principal defects are its heavy stooling, its tendency to gooseneck, its non-uniformity in height and its low fodder value.

White Milo

White Milo is closely related to Yellow Milo, being simliar in nature of growth and general appearance. The chief difference is in the white seed and white chaff or glumes of the White Milo. It is being distributed by California seedsmen, and in variety tests at Davis, extending over four years, it has averaged 3,175 pounds per acre, White Durra (White Egyptian) 1,015, Brown Durra (Brown Egyptian) 3,151, and Feterita 2,909.

As a fodder crop it is very similar to Dwarf Milo maize, and has produced a slightly higher tonnage of fodder per acre than either the Dwarf or Standard Milo varieties. It also exceeds Feterita in this respect. It is, however, inferior to Kafir varieties, and to the saccharine or sweet sorghums in the yield of fodder per acre. Its chief defects are a tendency to lodge, and its non-uniformity in height. No strains of dwarf stature have as yet been developed.

Feterita

The name Feterita was first used by the office of foreign seed and plant introduction for a sample of seed obtained from B. Nathan Co., Alexandria, Egypt, in 1901. The name Sudan Durra has also been applied to it.

Feterita resembles Milo in habit of growth, except that it is taller and the heads are uniformly erect, and the seeds are slightly bluish white in color. It differs from ordinary White Egyptian corn (Jerusalem corn) (White Durra) in having naturally erect heads, black glumes and plumper seed. The seed of Feterita shatters more than Milo, but less than Common White Durra, if the crop is allowed to stand in the field until over ripe.

In comparative variety trials over a period of four years at the university farm, it has been proven to be less productive than Dwarf Milo, Standard Milo, White Milo, or Brown Durra. Its average yield per acre of seed has been 2,909 pounds per acre, compared with 3,575 for Dwarf Milo, 3,041 for Standard Milo, 3,176 for White Milo, and 3,135 for Brown Durra. It is one of the most difficult of the grain sorghums to obtain a stand with. It makes a tall growth, and is leafier, more succulent, and has a higher forage value than Standard Milo.

White Durra

White Durra, quite commonly called "Jerusalem Corn" or "White Gyp" corn, is similar to Brown Durra. The plant is coarse in stalk and leaf, the head is gooseneck or pendant, the kernels are almost covered with a heavy hairy hull. Because of the coarseness of the plant it is not adapted for growing for forage purposes.

Over a four year period without irrigation at the university farm at Davis it has yielded 1,015 pounds of grain per acre, compared with 3,575 for Dwarf Milo, 3,041 for Standard Milo, 3,176 for White Milo, 3,151 for Brown Durra.

At Kearney Park, Fresno County, it has yielded 177 pounds per acre, as compared with 1,817 for Feterita, 1,731 for Standard Milo, 1,739 for Dwarf Milo. The low yields have been caused to a large extent by insect and bird damage and loss by shattering.

Brown Durra

Brown Durra is similar to White Durra in its general appearance but shatters less and has given a higher yield of grain at Davis. Under conditions which cause White Durra to yield 1,200 pounds seed per acre Brown Durra has yielded 3,200 pounds of seed per acre, and the difference is largely due to the fact that it shatters less and is damaged less by birds. Birds seem to prefer the white seeded varieties in the field and are more destructive at the time when the seeds are in the milk. The brown seeded varieties contain a higher percentage of tannin in the seed coat at this stage of development, and it is thought that this is objectionable to the birds. Brown Durra usually brings a lower market price than White Durra. Both Brown and White Egyptian corn are grown throughout California but are practically unknown in the grain sorghum districts of the middle west and the southwest. They are poorly adapted to harvesting with machinery and are objected to because of their tendency to shatter, lodge, sucker and form goosenecks.

Kafir Group

The Kafir varieties are grown more extensively than the Durra varieties in the sorghum producing districts of Kansas, Nebraska, Oklahoma, Indian Territory, and Texas, but because of late maturity cannot be successfully grown in California. As a group they may be regarded as a dual purpose type of sorghum, being intermediate between the grain sorghum or Durras and the saccharine or forage sorghums. In California they are less productive as grain crops than the Durras, but a larger quantity of forage is produced by them. They cannot, however, equal the saccharine sorghums in forage production, although they do exceed them in grain production. They are intermediate between grain sorghums and saccharine sorghums in height, and possess more leaves and a more succulent stalk than the Durras, but do not equal the saccharine sorghums in this respect. Most of the varieties originated in the Orange River Colony of Africa and take their group name from the native tribe of that region.

Black Hulled White Kafir

Black Hulled White Kafir was introduced into the United States about 1876, probably from northern Africa. It immediately found favor in place of other varieties of Kafirs because the seed lacked the astringent taste of the other Kafir varieties. The name has been given because of the white seeds with shiny black hulls. It is a moderately tall growing plant, growing from five to eight feet in height and is very leafy.

Grown at the university farm without irrigation over a four year period it has yielded an average of 1,962 pounds of grain per acre and is the fifth highest in production. In some sections it is used quite extensively for ensilage purposes, but in total tonnage of forage produced it has been out-yielded at the university farm by Honey and other forage sorghum varieties.

It is by far the most important variety of Kafir corn cultivated in the United States and has made the best showing of any of the varieties under California conditions. It is not recommended for this state, however, since better results may be secured by growing the purely grain sorghums for grain production or the saccharine sorghums for forage production. Other varieties of Kafir corn, such as Red, are very similar to the Black Hulled White Kafir but are even later in ripening and have not yielded as satisfactorily at Davis. A great many varieties of Kafir corn have been grown experimentally at the university farm, but none of them have shown special promise.

Milo Grain Growing and Drying

Very often milo fails to ripen sufficiently to thresh before fall weather sets in and must be artificially dried either before or after threshing. Last season this was accomplished at the university farm by running the threshed seed through a fruit evaporator until the moisture content was reduced to a point making it safe to sack. In the illustration a drying shed used by F. P. Bouery of Merced and designed to protect the heads from rain and dew while drying is illustrated. Double cropping, which necessitates late planting and results in late ripening, makes such methods necessary. Upper picture gives view of temporary shed. It is made by nailing 24-foot planks to posts made of car stakes, with grape stakes spread over without nailing. Roofing paper used for roof. Shed 240 feet long by 11 feet wide. Heighth 10 feet, in front and 8 feet in back. 2 feet between stories. 3 posts per span, with 30 spans 8 feet apart.

Lower picture shows field planted with Select University Farm Dwarf Milo Maize Cal. No. 59. This strain is the result of four years head-to-plat selection. With dwarf milo the objective has been to develop a strain showing uniformity of height, erect heads, dwarf stature and single stalks. The strain is still far from perfect and is susceptible of futher improvement, yet it is superior to any strain of dwarf milo yet grown at the university farm. It stools less than unselected stock, carries more of its heads erect, and is as uniform in height as any strain could be which has as many nodding heads and stools as much as it does. It yielded at the rate of 2,837 pounds of recleaned seed per acre testing 58.7 pounds per bushel. It is regarded as inferior to White Yolo Maize Cal. No. S-60. Further improvement of this strain should be directed towards single stalk character and erect heads.

OLIVE TARIFF

J. J. Hoey, secretary of the California Olive Association, who arrived in Washington, D. C., from Los Angeles on April 11, reports by wire to the California Olive Association that there is every indication that the emergency tariff bill will be passed as it stands with the import duty on olive oil reduced in the conference to 40 cents a gallon in bulk and 50 cents a gallon in five gallon containers, and the duty on olives in solution, 25 cents a gallon, and on olives not in solution, 3 cents a pound.

The drafting of a permanent tariff bill is now in the hands of a subcommittee composed of Representatives Longworth, Copley and Hadley. A fight is being made by the California delegation to restore the original schedule of 60 and 70 cents on oil and 5 cents a pound on olives not in solution.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

If one can enjoy a piece of music a second, or perhaps a hundredth time, or look at a beautiful painting many times before its full beauty is appreciated, we feel we are justified in repeating at least once the photograph shown on the cover of this issue. The cluster of raisins was a wonderful work of nature and the photograph is a wonderful work of art. This same cluster of raisins honored Raisin Day five years ago by appearing upon the Cultivator cover. We never saw a finer product from California vineyards.

* * *

In 1873 California produced 120,000 pounds of raisins. The imports of raisins that year were 35,271,312 pounds. Ten years later production had increased to 2,800,000 pounds, while the imports had also increased to a total of 51,487,389 pounds. That was about the highest point imports ever reached. Since that time our own production has increased and imports decreased until in 1919 it required an importation of 119,969 pounds, valued at less than $35,000, in addition to California's production, to supply the entire United States.

* * *

Now the farmer goes to market in his airplane. At least one did, according to report. We hope our subscribers will recall that some ten years ago a special spraying number of the California Cultivator showed an admirably worked out scheme of orchard spraying by the use of a dirigible. This is recalled, not for the purpose of claiming any rights of invention but to remind our flying farmers that the Cultivator wishes to be considered in the advance in the matter of these suggestions.

* * *

This is the year in which there is going to be a keen demand for high grade fruit on the top of the box—likewise in the middle and on the bottom. For a time we feared the demand for canning fruits this year would be materially lessened because of the great holdover. The holdover is now rapidly disappearing and the consuming public will soon be asking: "What are we going to eat next year?" If the demand should be greatly increased, still there is requirement for a large quantity of the finest; if the demand is lighter, still the best always goes.

* * *

C. J. Fawcett, wool marketing director of the American Farm Bureau Federation, reports large sales of the 1920 wool pool during the last week. Through the National Wool Warehouse and Storage Company at Chicago, 610,000 pounds were sold. Fifty thousand pounds were sold from the Michigan pool. Only 60,000 pounds remain in the Ohio pool.

* * *

A Ventura County paper reports: "Hundreds, perhaps thousands, of tons of onions have been dumped in the wide bed of the Santa Ynez River." "The onions were harvested, sacked and stored in warehouses, but the growers have become willing to abandon and dump rather than pay further warehouse charges." Now comes word of the consolidation of two bureaus of the department of agriculture. The bureau of crop estimates now becomes a part of the bureau of markets. It appeals to us that proper coordination of these forces for good should prevent clogging the Santa Ynez River with decaying onions. Something is rotten in Denmark as well as in Santa Ynez.

* * *

The strike of the English miners appears to be broken. Packingtown strike in this country is emphatically broken; the men are all back at work. Now if somebody would put a stick of dynamite under Yap the world would be quite peaceful-like.

* * *

The Cultivator monthly award for the month of March in the State Dairy Cow Competition has been reported by Prof. Woll as made to F. F. Pellissier of Whittier. The average per cow for the five in the winning team was 75.70 pounds fat. Particulars as to each cow's production next week.

* * *

CLOSER COOPERATION

Producers will be more greatly benefited by closer, more intensive cooperation, but we fear that sometimes cooperators reckon backward and become competitors with their own best interests. We believe it is to the best interests of the family of the farmer that it shall have access to right social, educational and religious conditions. No finer center of such conditions can be found than that existing in the progressive, up-to-date little town. Such a town cannot exist without support, both morally and financially, on the part of those who live in the community about the town.

Again, and in a larger way, there should be cooperation between different communities. To illustrate, may we take a case in point—not entirely imaginary: Two separate communities in California, large producers of poultry products; in each a large and efficient cooperative egg marketing association. One of these associations considers present conditions unfavorable to immediate disposal of eggs, hence cold storage gets the greater portion of its output. This has resulted in a sustained market, prices running, say, two or three cents above those in the other community. This higher price is exceptionally attractive, and two cars, or sometimes as high as three cars, of eggs per day are shipped from the district of the second association for marketing in the district of the other which is engaged in storing. This puts an almost unbearable burden on one association and in the end cannot materially benefit the other.

We need closer cooperation and a little more long headed observation of the fact that the immediate penny is not larger than the more distant dollar.

DAIRY CONFERENCE

Under direction of the American Farm Bureau Federation there will be held in Chicago on May 3 and 4 a National Dairy Marketing Conference. Two days will be required to discuss matters of interest to dairymen, but more particularly distribution and marketing in the larger cities and especially the disposal of skimmilk, whey, and other wastes of creamery and factory.

The first day of the conference will be devoted to hearing 15 minute reports by delegates of marketing associations now operating in some of the larger cities and also by delegates from seven smaller cities. On the second day the discussion will center on the problem of creating associations for unorganized territory, and the cooperative marketing of butter and cheese.

COURSES IN COOPERATION

President Howard of the farm bureau has been appealing to state universities and colleges of agriculture, asking that courses be established to train young men in the various phases of cooperative marketing. Replies have been received from over 30 colleges. All express the keenest interest in such courses. Thirteen give definite assurance that such courses will be established. Twelve report that they already offer such courses. Three of the latter express a hope of improving the courses now offered. Only two colleges have replied negatively. These give "lack of funds" as the reason.

Why not? Cooperation is becoming an essential to the American producer. If our children can be instructed in its principles they should be able to cooperate more quickly and far more effectively.

QUARANTINE BOARD

The Western Plant Quarantine Board will meet June 7-12 in the city of Vancouver, British Columbia. Readers of the Cultivator may recall that in June, 1919, a full account of the organization of this body was given. The organization was perfected at the time of the State Fruit Growers Convention held in Riverside. George H. Hecke was elected chairman; Charles A. Park of Salem, Oregon, vice chairman; Harold R. Hagan, Salt Lake City, secretary-treasurer. Mr. Hecke is still chairman and will preside at the coming Vancouver meeting. The organization is today in a stronger position than ever and is one great factor in the success of federal quarantine.

Naturally, these two years, being the first years of the organization, have been critical, and much constructive work has been necessary to bring into line the quarantine officers of the 11 Western States, British Columbia, Hawaii and Lower California, who comprise the membership of the board. The object of the board is the mutual protection of agriculture and horticulture in the West through uniform quarantine regulations and enforcement when and where practicable. Since its formation there has been a more friendly spirit in evidence among the western quarantine officers, and there is a tendency to get together and consider all phases of the problems affecting the states concerned before quarantine is resorted to. This by no means deters quarantine action where the same is necessary, but it has several times been responsible for the solution of problems without invoking quarantine authority. The good that can result from such an association can hardly be overestimated. Mr. Hecke and other officials of the association should be supported in the effort to protect horticulture of the western seaboard and the entire country.

EDUCATIONAL FEATURES ON PICNIC DAY

The annual picnic at the Davis farm school will be held April 23.

An effort is being made to emphasize the educational side of Picnic Day this year as never before. This institutional event was originally founded with the idea of bringing the citizens of the state in close contact with the working machinery of the school, to afford all taxpayers, as well as those primarily interested in agriculture, an opportunity to visit the university farm at its best. Every department is doubling its efforts this year to display its best products and exhibit concrete and valuable matter pertaining to the various phases of agricultural science.

The pomology division has planned a particularly interesting program. The offices and experimental laboratory will be open all day. Here results of experiments in pruning, spraying and care of orchards will be shown in concrete manner. Many examples of disease and insect control will be shown by specimens, charts, etc.

The animal husbandry division is planning a number of educational features. A preliminary stock judging contest is now being conducted. About 60 students are in this contest, which will continue until Picnic Day. By this means the highest 20 men are chosen to participate before the public on Picnic Day.

It is planned to have a "fitting team" of four men perform before the crowd during the time when the stock judgers are looking their animals over.

A unique feature being planned is a "debate" between a team of three selected vocational high school teachers and three U. S. students. This debate will deal with some class of livestock not previously known to the contestants, a good and a bad individual, to be brought into the judging tent before the crowd.

The agricultural engineering division will have many types of up to date farm machinery and tractors on the floor. A liberal use of placards and display of signs will insure an understanding of the exhibits.

The irrigation division will have a splendid display of concrete pipe and accessories at the out-of-doors irrigation laboratory, by the reservoir. There will be a display of all types of delivery gates and measuring devices, both concrete and timber. Such instruments as are needed in ordinary irrigation surveying will be shown and explained.

The veterinary science division will give information concerning many kinds of diseases and the methods of treating them will be shown by means of specimens and charts. A display of useful veterinary instruments for the farm will be valuable.

The soil technology division will display samples of soil from all parts of the state, hard pan and rock formations, samples of fertilizers; numerous soil survey maps; soil moisture testing apparatus, including soil auger, oven, etc.; various types of drainage tile; charts, placards and bulletins pertaining to soil problems.

The poultry husbandry division will show how eggs can be preserved at home in water glass. A striking exhibit will show the difference in profit between good and poor chickens, and proper and incorrect feeding and care. Charts will be used to show value of correct breeding, culling, electric lights in laying houses, and feeding. There will be a ration exhibit; also blueprints and models of poultry structures and equipment.

The agronomy division will show many types of field crops. The important varieties of wheat, barley, oats, sorghums, corn, etc., will be completely labeled with cards containing descriptive matter concerning culture and adaptation, time of planting, rate of seeding, yield, etc.

Frost Injury to Young Fig Trees

By Ira J. Condit

THE severe frost which occurred on the night of April 3 did considerable damage to fig trees, especially to young orchards. The new growth was just at that tender stage which made it susceptible to severe injury. In the Clovis district where the most serious effects have been noticed the new shoots on Calimyrna trees were two to three inches long. These were not only killed back but the tips of last year's wood were also injured. While older Adriatic trees, which are ten days to two weeks earlier in leafing out than the Calimyrna, had some of the leaves frosted, the damage is only slight. The effect of the frost on caprifigs is now beginning to show up, ten days after the cold night occurred. Figs, which a few days ago appeared to be green, firm and in good condition, are turning yellow, shiveling up, or showing yellow stems. The caprifig crop on young six year old trees in the Clovis district is practically a total loss. Even on full bearing caprifig trees in Wolter's Colony district some of the loss was as high as 60 per cent. Although mamme figs do not show superficial injury, the insects inside are not as active as they would have been under more favorable weather conditions, especially as the days and nights have continued cold and windy.

Frost is no respecter of persons or districts. While we read of frostless and thermal belts where no injury has ever occurred, such places are occasionally hit sooner or later, although possibly not as hard as the open valley. This was well exemplified in Southern California in 1912-1913, the winter of the "big freeze" when the foothill districts suffered as severely as the valleys. This does not mean that caprifigs will not thrive better and be safer from injury in the foothills than in the valley, for there is no doubt that the air drainage on the slopes gives almost perfect protection except in rare instances when cold winds actually freeze the fruit and branches as they did in 1913.

The second or main crop of figs comes on the new wood of the present season's growth. In case this new wood has been frosted and killed, the dormant buds low down will start out and produce both leaves and fruit. These buds, however, will be slow to start. Unless favorable growing conditions exist they will not set figs until three or four weeks later than the crop would have set had no frost occurred. In case of Calimyrna this may make the figs too late to caprify or if caprified too late to mature properly in the fall. The buds, moreover, which start may be numerous and the resulting growth, instead of going into one or two strong vigorous shoots, will go into a few weak ones. This should not be the case in strong growing trees where there is plenty of moisture in the ground. In most cases the frost will simply retard the development of the buds and the setting of the fruit, acting as an early summer pruning.

There is no evidence to show that anything will be gained by pruning off the injured twigs at the present time. In the first place it is very difficult, if not impossible, to determine just how far back the injured tissue extends. One can cut off the tip and cut again, then keep cutting until seemingly healthy wood is found; even then he cannot be sure that the buds below are going to push out. Again, it is impracticable to prune off the frosted twigs on any extensive scale, especially if the work has to be entrusted to careless workmen. So far as I can learn, there is no danger to the rest of the branch from leaving the frosted tip on.

Many growers seem to fear that "sour sap" will develop and that the whole tree will die. If any case of sour sap in a fig tree develops I shall be glad indeed to have it called to my attention. The frozen tissue may and undoubtedly will furnish an excellent medium for the development of two or three forms of die-back organisms; these fungi are already present in the orchards and infection will probably take place. No serious injury from this source, however, need be feared. Sour sap is a trouble which affects stone fruit trees in the spring of the year and appears to be due entirely to climatic conditions resulting from a combination of unseasonably warm, balmy weather in winter followed by a marked change to colder weather. The cold weather checks the flow of sap and other functional activities of the tree, causing stagnation and finally fermentation. It is possible that such a condition might result with the fig tree, but it is not at all probable.

While the cases are not exactly parallel the experience of the lemon and orange growers in 1913 may be of some value in the present instance where serious frost injury has occurred to fig trees. Most citrus growers followed the advice of experiment station men not to prune until the extent of the damage became celarly defined. In case pruning was done immediately or shortly after the freeze it was found that a second pruning had to be done later in order to completely remove the dead branches. The results obtained in experiments tried out in various places demonstrated conclusively that early pruning of citrus trees after a freeze is unnecessary, does no good, and increases the expense, as a second pruning is necessitated. No trouble from so-called "sour sap" resulted from leaving the dead tissue in the tree. On account of the exposed bark being liable to sunburn many growers whitewashed the trunks and main branches with a wash made according to the following formula: Take 30 pounds of quicklime, 4 pounds of tallow, 5 pounds of salt, and mix together. Slake slowly and blend. Dilute with enough water to make mixture flow well.

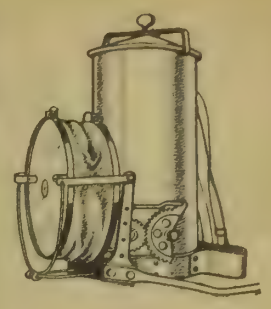
TENNESSEE WINTER BARLEY

Tennessee winter barley has come to occupy an important place on the grain lands of the Sacramento Valley because of its suitability for fall planting on heavy adobe soils under conditions which would result in the drowning out of common or Mariout barley. Distributed from the university farm some ten years ago, it has long since passed through the experimental stage and many of the best grain growers are placing reliance in it. J. W. Gibson of Winters stated to Professor G. W. Hendry of the university farm that 250 acres of his rice land five and one-half miles northeast of Winters is carrying a heavy crop of Tennesee Winter this season and that he has not been successful in producing common barley on this tract previously because of poor drainage and "drowning out." The Tennessee Winter was planted October 25 and the ground remained wet and soggy throughout the months of November, December and January. As is the habit with this variety, the young plants looked stunted and sickly during the wet weather but resumed a normal growth during the warm weather of February and March and made a vigorous top growth without showing any injurious effects such as common barley does under such circumstances. Tennessee Winter barley is the best of the common barleys for such conditions and is capable of standing about as much "wet feet" as wheat without injury.

CROPS TO PLANT NOW

In investigating frost injury it was found that a few bold planters lost crops of beans, melons, tomatoes, and one, a small field of chili peppers. But all are agreed it was not advisable to plant any of these crops at such an early date. Even now it is too early for some of them.

So to those who have lost through frost there remains plenty of time, even to the 15th of May, to plant: beans, cantaloupes, peanuts, peppers, sweet potatoes, tomatoes and watermelons. This presumes water for irrigation is available. If one has no water Kafir corn and milo will grow if soil is in good shape; milo will grow if anything will. If soil is fine, that is, well pulverized, and holds moisture well, millet will grow and it will prove the shortest season crop we have. From time of sowing to hay harvest is but ten to 12 weeks.



100% Efficient

Dust Your Orchard with the American Beauty Dust Sprayer

This powerful sprayer—built for orchard, field and vineyard—is one of the fastest, most thorough and economical dust sprayers ever built. The American Beauty, operated by one man alone, will economically spray 15 acres a day in orchard work, with correspondingly greater acreages in field or vineyard.

Government experiments have proven the superiority of dry dust over wet sprays in the control of Red Spider, Thrips, Aphis, Leaf-Hopper and similar insects. Our dry dust preparations used in the American Beauty Sprayer are unequalled in the eradication of insect pests and fungus diseases.

More Complete Organization Among Date Growers

By Paul Popenoe

ORGANIZATION has been announced of the California Date Growers Cooperative Association. The members are all in either the Imperial or Coachella Valleys. R. H. Postlethwaite of Coachella is chairman of the organization and George M. Beach of Thermal is secretary.

The young date industry of the state has had a number of organizations, most of which have been useful for a season and then succumbed. The present organization takes in a larger acreage than any of its predecessors, and its members have planned to avoid difficulties by starting slowly.

For the present the organization will confine itself to serving as a clearing house for information among its members and seeking to promote cooperation between the date growers of various parts of the Southwest; and also between the date growers and the various state and federal agencies interested in the subject.

A special effort will be made to get the federal department of agriculture to carry out and publish information as to important research work.

As soon as possible the association will undertake to aid its members through cooperative packing and marketing. It is asserted that this is now the principal problem facing the date growers of California and that it can best be solved by cooperation similar to that which exists in other California fruit industries.

A committee on program of work, which was appointed by the association, has laid down half a dozen problems as particularly requiring attention in the near future. On most of these it is believed that there exist data among the various private growers of the Southwest which, if properly brought together and analyzed, would enable some useful conclusions to be drawn.

Culture of the Palm

Much is yet to be learned about the suitability of various types of soil and various degrees of alkali concentration to the date palm in general and to the different standard varieties now grown. Although no data have been published on this subject in California there are available growers records covering a period of a score of more of years, under widely varying conditions.

It is said that a proper study of these might throw much light on the problems before ranchers in the San Joaquin Valley, some of whom are beginning to look for other crops to plant on land that has become excessively alkaline. If an early ripening date with high alkali resistance can be found, it would be well adapted to such localities.

Adaptability of Varieties

More than 200 varieties of date palm imported from the old world have been tried out in the Southwest. It is believed that a careful study of these, and especially of growers and packers records of the varieties that have been grown commercially, would clear up many problems which are now matters of controversy among the growers.

Seedling Palms

The number of seedlings started in California up to the present has been estimated as high as 250,000. Most of these have been neglected or abandoned, and the number of seedlings set out in orchard form and well cared for at the present time perhaps does not exceed 50 or 60 acres.

Pollinating Dates

Dates require artificial pollination. As a rule pollen bearing plants are in full bloom when the female, or fruit bearing, plant begins its bloom, but to provide for emergency growers usually preserve pollen from one year to another in order to secure perfect pollination.

Strong statements have been made both for and against the seedling as a commercial proposition. No records have been published, however, to show what an ordinary seedling orchard will actually do, or to show whether the so-called pedigreed seedlings are any better than other seedlings. It is believed that the healthy growth of the date industry will be promoted if facts and figures on this point are substituted for the opinions now circulating.

Possibilities of Mixed Farming

Since the date palm does not require all of the growers land or time, it has seemed possible that some type of mixed farming, or of supplementary cropping, might be advantageous. The association proposes to get any authentic information that can be secured, which will throw light on this point.

Supply of Labor

The date harvest comes from August to November, when a considerable supply of seasonal labor is necessary. The association will study the possibility of helping its members to get this supply, possibly by some cooperative arrangement with industries elsewhere in the state, as for example the citrus industry, whose principal supply of labor is not needed in the autumn.

Standardization of Pack

This is one of the problems bound up with the questions of marketing. Owing to the newness of the date industry, and the large number of seedlings now being marketed, there is no uniform practice in regard to size, type or quality of pack put out by California growers. Standardization is one of the first and most difficult problems to be attacked.

While no census of the date industry exists, it is probable that the acreage of imported varieties in California does not exceed 400.

The most widely grown of the early ripening varieties are Khadhrawi, Ghars, Khustawi, Tazizaut and Halawi.

Of the mid-season dates, Zahidi, Maktum, Dubaini and Yatimeh are best known.

Among the late ripening varieties Tafazwin, Deglet Nur and Thuri have been most widely planted.

Some of the superlative varieties of Arabia, such as Barhi, Khalaseh and Asharasi are also grown, but in limited numbers so far.

There are probably several hundred ranchers in the state who are growing dates with more or less idea of selling them, but a large part of these have seedlings, or only a few palms of standard varieties.

The largest plantation in the United States, containing more than 100 acres of dates of imported varieties, is near Thermal, in the Coachella Valley. One of 80 acres is established near El Centro in the Imperial Valley.

Palms flowered very early this spring, some of them in February, and the profusion of bloom indicates an unusually large crop, particularly as much additional acreage will bear this fall for the first time.

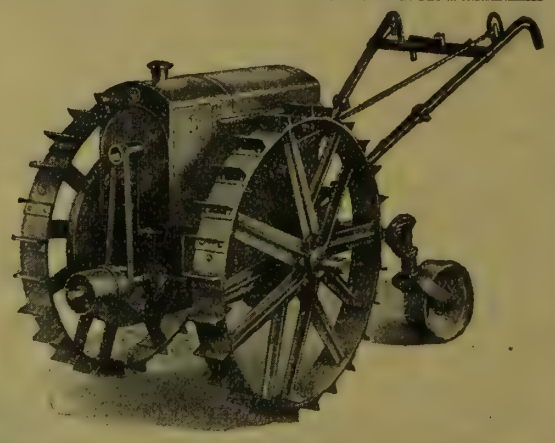
CALIFORNIA RAISIN FESTIVAL

Fourteen cities and towns in the San Joaquin Valley will be represented by their best voices in the mammoth chorus of 1,000 for which the large Fresno Auditorium is being practically remodeled. Besides Fresno, singing contingents are coming from Porterville, Lindsay, Exeter, Dinuba, Reedley, Orosi, Hanford, Lemoore, Selma, Fowler, Clovis, Kerman and Parlier. For the two festival performances on Friday, April 29, entirely separate programs will be given in the afternoon and evening. An idea of the repertory now being rehearsed may be had from the inclusion of the Halleluiah Chorus from the "Messiah," the Inflammatus from "Stabat Mater," the Barcarolle from "Tales from Hoffman," Waltz from "Faust," the Toreador song from "Carmen."

At the Fresno Auditorium special seating arrangements are being made for both performers and public, to insure that every person will hear per-

NEW BRITAIN TRACTOR

ALL PURPOSE ECONOMICAL FARM POWER UNIT



N. B. Tractor working close to trees in walnut orchard.

N. B. Tractor plowing. Note quality of work and deep straight furrow.

Consider the Diversified Utility of the Tractor You Buy

The ever increasing demand for Farm Power in small units of diversified utility and moderate investment is met with the N. B. Tractor.

It is made by the New Britain Machine Co., one of the nation's foremost manufacturers for thirty-three years.

The N. B. Tractor is of the garden type and is adapted to all light farming operations, plowing, discing, harrowing, furrowing, land leveling, etc. Its belt attachment makes its power accessible for pumping, sawing wood, filling silos, running cream separators, or any work requiring six horse power.

For use in truck gardens, orchards, nurseries, small farms, as well as for furnishing power for mowing lawns on large estates or country clubs, the N. B. Tractor is indispensable.

The application of Farm Power in small units permits of a division of investment, and enables the farmer to accomplish many duties without loss of time or expensive tie-ups of equipment.

SPECIFICATIONS:

The N. B. Tractor has a six horse power, two cylinder, 2¾ inch by 4 inch cycle motor cast en bloc, Kingston carburetor, 2¾ inch high tension magneto, Thermo siphon cooling system and centrifugal circulating and splash lubrication. Plain, ball and roller bearings.

The N. B. weighs seven hundred fifty pounds. Length, including handle bars, ninety-eight inches; width 28 to 33 inches; height thirty-nine inches with ample clearance.

It is four wheel type, two drive wheels, thirty-two inches high, with internal bull and pinion gears and interchangeable rims—the rear wheels are small castor wheels which facilitate turning and ease of operation.

This little tractor has highest quality materials and all the scientific engineering features to make it a dependable, versatile and powerful unit.

Write today for full information and arrange for demonstration on your own place. Ask for dealer proposition.

fectly. Further to perfect the acoustics, a large sounding board will be put up, and a new platform is being erected for the chorus. Tickets are on sale now with the various members of the chorus throughout the valley.

With 4,000 additional grandstand seats, and all of the lower seats in the box section raised to a much higher level, the Fresno Speedway Association has provided more and better accommodations for the coming championship race than have been afforded at any previous event. These improvements, coupled with the announcement that no machines will be allowed in the oval on Saturday, April 30, when the Raisin Festival Classic is run, are assurances that all of the disagreeable features of other events have been completely removed. An unobstructed view for the spectators, whether they occupy the highest priced seats or remain in the oval, is assured. Nothing has been spared that would make for greater comfort or for a greater degree of safety.

LEMON AND ORANGE CROPS OF SOUTHERN ITALY

The lemon and orange crops of the Naples consular district for the season of 1921 promise to be unusually good. This improvement is in contrast to the conditions of the preceding year, when the yield of both fruits was much below the average. The lemon crop of this year is estimated at 100 per cent above the average as compared with that of 1920, which was 30 per cent below normal. Approximately the same figures are given for the orange production.

Stimulated by the high exchange and depressed freight rates, large shipments of both fruits are anticipated. In 1920 the exports of lemons to the United States were valued at $87,600. Relatively small quantities were sent to Great Britain and France. The value of the oranges exported to the United States during the past year was $18,645. This figure indicates something of a revival in the trade with the United States, for of recent years nearly all of the Italian oranges have gone to France and England, because of tariff restrictions, distance, etc., and what many regard as the inferior quality of the Italian fruit as compared with the American product.

The price of lemons at present is ranging in the vicinity of 25 lire per box, and that of oranges is from 30 to 35 lire a box, depending on the quality. As the season for the largest shipments during the spring months approaches the prices may be expected to advance. (At current exchange $1 equals 27 lire.)

PLANTING A LESSON

On April 14 Farm Adviser Hodgson of Los Angeles County closed a series of 16 citrus topworking demonstrations. At each meeting a preliminary talk was given as to the value of topworking. Records were quoted of individual tree yields of some orchards over a period of several years, showing how the non-producing trees had cut down the profits, and by a comparison of figures how topworking of the drones should result in greatly increased yields and financial returns. Many of these demonstrations were made in remote districts, among settlers new to citrus growing and where the budding over of poor trees will soon teach a valuable lesson.

The buds used were furnished by the bud supply department of the California Fruit Growers Exchange, taken from trees of the highest performance found in the state. It is safe to say, then, that when these topworked trees come into bearing they will produce more and better oranges than any others in the several orchards. It may be that in future years we shall find orchardists gradually topworking all their trees to buds taken from the performance-record trees started by Mr. Hodgson. The great value of this work will be proven in years to come, though all visitors admit there is much learned at the meetings. At the last two meetings a citrus grower from New South Wales was present and stated it was a valuable experience to him.

CLAREMONT POMOLOGICAL CLUB

A horticultural club which has been responsible for some of California's best agricultural statutes, and one which has held, regular meetings for a period of over a quarter of a century, is the Claremont Pomological Club. It will hold its next regular meeting on Saturday, April 30, at the clubhouse on the J. B. Coulston place, with Mr. Coulston as host for the club. Mr. Coulston's place is just off the Foothill Boulevard on the road between Glendora and San Dimas, with a wonderful view over hill and valley. It will be an all day session, the forenoon being devoted to memorial to Dr. Cook, the speaker being C. C. Teague.

Because of the especially long life of this organization address will be made by C. C. Chapman of Fullerton on "Why the Club Has Lived."

Some five minute reminiscences of its early history will be given. W. A. Johnstone will refer to its pioneer work for good roads, he having been a member of its good roads committee in early years. F. L. Palmer will speak of the work of the club a quarter of a century ago in securing enactment of legislation which saved millions for the producers of the state. E. O. Essig will give talk on "How the Club Found Mealy Bug and Eradicated it in the Claremont District in 1909." C. B. Messenger, member of the original Pomona Home Telephone Committee, will recall instances of perfecting that farmers' organization which has today thousands of telephones in rural homes of that section. M. E. Jaffa, of the University of California, will discuss "Fruits of 25 Years Ago and Now." Geo. H. Hecke, director of state department of agriculture, will refer to some of the work of the department for the citrus industry. G. Harold Powell will discuss "Cooperation and Fruit Tariffs." Other informal talks will be made by Prof. C. B. Sumner, one of the charter members of the club, Prof. J. T. Barnett of the citrus experiment station, and Ernest Braunton.

CUBA COOPERATES IN FIGHT AGAINST CITRUS BLACK FLY

Fears of tropical fruit and vegetable growers and shippers, due to the American quarantine against the citrus black fly, effective April 1, are rendered groundless through the hearty cooperation of the Cuban government and West Indian growers, according to a report made by Dr. W. A. Orton, United States department of agriculture specialist and member of the federal horticultural board, after his return from the West Indies.

The quarantine order, which was promulgated by retiring Secretary Meredith after hearing all interests concerned, is directed particularly against the importation of foliage and parts of plants and other rubbish carrying the black fly pest, and the contamination of cars by coming through regions which are infested. The black fly does not attack fruit and is not seriously in evidence in the principal fruit growing regions, so that precautionary measures centered around the prevention of contamination of fruit cars en route to ports and the exclusion of foreign materials in the cars.

TWO OLD BUREAUS MAKE ONE NEW

In combining the bureau of markets with the bureau of crop estimates of the United States department of agriculture, which has been approved by congress and will become effective July 1, George Livingston will remain chief and Leon M. Estabrook will become associate chief. The new bureau will be known as the Bureau of Markets and Crop Estimates.

According to law the county horticultural commissioners have the power to refuse delivery of all shipments of nursery stock unaccompanied by a manifest showing the contents of each shipment, the name of the locality where the contents were grown and a statement of the contents therein, together with the name of the shipper.

The number of students registering in the University of Arizona for 1920-21 is 1,014.

"Some Growth—
For A Year"

"I blasted between the rows in this orchard last fall and look at this year's growth—look at the fruit, too. I tell you these trees are in prime condition *now*. And last year they looked as if they were through. It certainly pays to cultivate with

HERCULES
FARM DYNAMITE

"The Hercules Powder Co. publishes a 68-page book called 'Progressive Cultivation.' Send for it *today*. It tells you all about the use of explosives on the ranch and in the orchard—how to plant trees, cultivate bearing orchards, clear land, dig ditches and do many other heavy jobs around the place."

Mail the attached coupon *today*—and "Progressive Cultivation" will be sent you free of charge.

Hercules Dynamite is for sale by leading Hardware and Implement dealers

WHAT WILL THE HARVEST BE?

(Continued from Page 543.)

M. Sharp, Vacaville, Solano County

Almonds: 60 per cent.
Apples: 100 per cent.
Apricots: 35 per cent.
Cherries: 100 per cent.
Peaches, 75 per cent.
Pears: Dropping badly. Cannot estimate yet.
Prunes: 100.
Plums: 100.
Grapes: 100.

A. H. Call, Horticultural Commissioner, Ventura County

Apricots: 20 per cent of crop. Would have had about 50 per cent of crop if not for frost.

Mrs. Clara K. Graham, Ramona, San Diego County

Apples: Too early to tell.
Apricots: Poor crop.
Cherries: None.
Peaches: Have set heavily; need to be thinned.
Pears: Setting well.
Prunes: None.
Grapes: Good.
The cold snap did no harm to my fruit.

Arthur E. Beers, Horticultural Commissioner, Merced County

Almonds: Prospects of full crop.
Apples: No commercial orchards.
Apricots: 90 per cent.
Cherries: No commercial orchards.
Peaches: Prospects for largest crop we ever had.
Grapes: Increased acreage, full crop, no frost damage.

Santa Ana Register, Santa Ana

Apricots: Crop about same as last year. Fruit on old trees damaged by rains. Young trees will bear good crop. Frost did no damage whatever in Orange County. About 800 acres to apricots in county. Fifteen cars of dried fruit shipped in 1920.

Redlands Facts, Redlands, San Bernardino County

Almonds: Not more than 50 per cent crop—damaged by frost.
Apples: Very few apples in Redlands; good crop what there is. Fair crop for Yucaipa. Heavy damage by frost in Oak Glen.
Apricots: Good prospects now for an excellent crop.
Cherries: Good.
Peaches: Good.
Pears: Only fair.
Prunes: Good.
Grapes: Only fair; some damage by frost.

P. F. McKinney, San Jose

The damage to apricots in this vicinity by brown rot was greater than ever before. I find it was quite serious in Alameda County also. The frost also took heavy toll. The present estimate is for about 30 per cent of a crop. The frost also damaged the sugar prunes, as well as the French prunes. It is too early to estimate the entire prune crop.

California Peach and Fig Growers, J. F. Niswander, General Manager

Reports from various parts of the state indicate that caprifigs were severely damaged by the frost. It is believed that the supply of Capris for the season will be very limited, which will mean a short crop of Calimyrna figs. The frost also did some damage to the Black Mission and White Adriatic figs. If the caprifigs have suffered to the extent now indicated, we would not expect more than 50 per cent of the normal crop.

Fresno Republican, Fresno

Grapes: The ravages of the grape leaf hopper, following close upon the recent frost, threaten to further reduce the raisin crop this year. Hopper damage has been reported to the California Associated Raisin Company from many sections of Tulare, Fresno, Madera and other San Joaquin Valley counties. Where the frost hit the hardest, the hopper menace is most dangerous as the swarms of adult insects are concentrating upon the replacement growth. If they are in sufficient numbers, their feeding may slow down to recovery of the damaged vines. The adults will also soon lay eggs to hatch out the numerous summer brood.

Observers everywhere are agreeing that 1921 promises to be a leaf hopper year for the vineyardist. It has been about 40 years since there were any serious ravages by this pest, but while the recent frost is the most spectacular reducer of crops, the damage done by the leaf hopper promises to be far from negligible. In fact, the over wintering adult hoppers are more numerous throughout the valley than ever before observed in the early part of April.

A long distance telephone message to L. R. Payne said that a 50 per cent loss had been sustained in Yolo, Yuba and Sutter Counties, where in some instances vineyards were 100 per cent destroyed. The normal crop of that territory, said Payne, is about 6,000 tons.

Pears and Apples: Dispatch from Bakersfield, April 7—Official information was received here today through the county horticultural commission that the 1921 Tehachapi pear crop, which was in process of formation in the trees when the temperature suddenly dropped below freezing point Sunday night, has been practically annihilated by frost and snow.

Though it is impossible to accurately estimate the financial loss resulting from the cold weather killing the future crop, it has been unofficially calculated that the damage, figured in cash, totals almost $50,000. Last year approximately 10,000 boxes of pears were exported from the Tehachapi district, a large percentage of which were sold for $5 and $5.50 a box. The crop last year was only 25 per cent of normal, having been depleted by freezing weather coming late in the season.

The mercury registered 24 degrees Fahrenheit, lowest point, Sunday night at Tehachapi, and 28 degrees last night, it was officially reported today to Horticultural Commissioner Harold Pomeroy. Thirty-two degrees Fahrenheit is freezing. Snow fell in the mountain district yesterday and frosts mantled the high valley both last night and Sunday night.

Early ripening varieties of apples grown at Tehachapi were also damaged by the cold, according to today's reports, though the later varieties are believed to have survived the low temperatures in healthy condition. There is approximately 950 acres of bearing pear trees in the valley, with 350 acres of younger trees not yet bearing.

Tulare Register

According to reports coming into the office of County Horticultural Commissioner Shepard, Tuolumne County will have a bumper crop of apples and other fruits this season. Already it is estimated the county will produce over 30,000 tons of apples. This estimate is declared to be large, considering the crop of the last two years has only averaged 15,000 tons.

California Fruit Distributors, Sacramento, Wilmer Sieg

It would be simply impossible to give you any definite facts at the present time. To the best of our knowledge and belief apricots are seriously hurt both by the cold weather and perhaps by some of the fungus that affected them last year.

Grapes are to some extent hurt in the San Joaquin Valley and to a very limited extent at Lodi, but nobody yet knows the extent or the chance for rejuvenation, so any report at the present time would be rather premature.

The tree fruits, especially in the Sacramento Valley, are in splendid condition, but the old Chinaman used to say that "plenty of flowers little fruit," and we have had an abundant blossom. It will be two weeks at least before anyone can tell what amount of fruit is going to hold, but the crop prospects are, in my opinion, generally good ones and we should mature a quantity of fruit. However, any statement made as to crops at the present time carries with it an element of doubt and in about two weeks we believe better predictions can be made.

U. S. Weather Bureau

The Summary of Weekly Weather and Crop Conditions for week ending April 13 refers to the damage from frosts and cold winds:

Newcastle, Placer County: A heavy north wind during the early days of the week, together with a little frost towards the close, marked the unfavorable aspect of the week's weather.

There is a tendency for fruit buds just setting to fall, but if any real damage was caused in this respect by the wind it is too early to determine it as yet. Of some varieties of plums, however, only a few buds are left. Meadows are in excellent condition; pastures and ranges are good; oats continue excellent, the dry winds and frost doing no damage to these.

Hopland, Mendocino County: Some frosts during past period but little damage done to fruit and hops. Hops are favorable.

Ducor, Tulare County: This has been a hard week on wheat and barley, all late sown, non-irrigated grain drying fast as the result of the drying north winds in early part of week. Winter wheat and barley in fair condition but spring wheat is poor.

Centerville, Alameda County: Frost destroyed many buds on apricot trees in this district. Prunes unharmed. Excellent growing weather this week.

Ontario, San Bernardino County: Hardly any rain since the middle of March. Irrigation of orchards has just been started. Light frost in middle of week caused no damage. Citrus fruit in excellent condition. Navel oranges being picked to full capacity of packing houses.

Julian, San Diego County: The apple crop of Julian is practically all lost for this year. The extent of the damage caused by frost Monday morning is now apparent. The apple trees were in bloom.

Los Alamos, Santa Barbara County: All crops badly in need of rain. High wind and frost damaged fruit to a moderate extent. Almond growers claim very little damage by frost; apricots and late peaches seem to have suffered most. Winter wheat, oats and barley in good condition with fair growth during past week.

John McNab, Fillmore, Ventura County

The recent cold spell and frosts have hit the walnuts with a hard blow on the Sespe Avenue of the county. In the walnuts orchard after orchard along the avenue is hard hit. Go down into the office of the farm adviser and take a look at the limb of a walnut tree I brought in. All the young leaves are black with the effects of the frost and the young nuts are in like condition.

Yucaipa News, Yucaipa, San Bernardino County

The cold wave of the first three days of this week has resulted in no damage to apples in Yucaipa, according to the opinion of the growers and of Horticultural Inspector Brooks, and former Inspector Taylor, who have given the valley a thorough inspection for results from the cold wave. No evidence of damage was found, except possibly in a few low spots where the temperature was lower than average. As to the effect on the apple crop at Oakglen, opinions vary from destruction of the entire crop to little damage done. The general view seems to be that the earlier apples have been damaged pretty severely and that the Rome Beauties have not been injured. The bulk of the acreage in that section is set to this variety.

W. A. Shepard, Auburn, Placer County

Almonds: Full crop.
Apples: Full crop.
Apricots: Half crop.
Cherries: Half crop.
Peaches: 90 per cent.
Pears: 75 per cent.
Plums: 50 per cent.
Grapes: Full crop.

Frost did not hurt this section at all. North wind hurt the plums some. A good many trees dying from sour sap.

(Above report from investigations of E. S. Culver, Auburn Fruit Exchange.)

Chico Chamber of Commerce, Frank Durkee, Secretary

Little early yet to tell frost damage to peaches. Almond condition very spotted. Some orchards have excellent crop prospects.

Almonds: Crop spotted. Some orchards have good stand, others practically total failure; partly due to frost.

Apples: Good crop reported in Paradise district.

Apricots: Not raised commercially in this district.

Cherries: Good crop reported from Paradise; only small acreage in Chico section.

Peaches: Pretty badly damaged in Chico district by frost; few weeks will tell how much. Some believe crop 75 per cent gone.

Pears: Good crop reported from Paradise; no frost damage there.

Prunes: Only slightly damaged in Chico district; heavier damage reported in Gridley section.

Grapes: Not raised commercially in Chico; heavy damage reported from Thermalito and southern parts of county.

J. F. Benton, Horticultural Commissioner, Humboldt County

Apples: Trees thrifty, bloom heavy. Cold rain during bloom productive of scab. Some frost damage.

Cherries: High cold wind did some damage.

Peaches: Frost following extreme heat did considerable damage.

Pears: Indications fair; damage by frost and scab will result from cold rain during blossoming period.

H. J. Ryan, Horticultural Commissioner, Los Angeles County

Frost Damage Report.—Deciduous fruit and walnut crop conditions, Los Angeles County, April 15, 1921:

1,251 acres pears reported 88 per cent crop.

4,335 acres apricots reported 38 per cent crop.

5,100 acres peaches reported 51 per cent crop.

20,501 acres walnuts reported 40 per cent crop.

Frost damage was very irregular. At some points the temperature was reported to be 26 degrees Fahrenheit. Some additional loss may have been sustained the nights of April 13 and 14. No report can be made on this at the present time.

E. W. Curtis, County Agent, Tehama County

Early this week I sent you a statement of the condition of fruit crops in Tehama County as regards frost injury. At the time of sending this report it was approximately correct, but on Wednesday of this week there occurred a severe frost which has caused damage that has not yet been estimated. It will be ten days or two weeks before the extent of the damage can be determind, and I will send you more complete information as soon as I can gather the data.

Press Dispatches

From many sections of the state reports of frosts coming on April 14, subsequent to the making of many of the above returns, show still greater injury, e. g., after the April 14 frosts Commissioner Beers of Merced reported 100 per cent destruction of cantaloupe crop in Turlock section and 80 per cent damage to tomato crop in Merced.

Watsonville reports damage of between 25 and 50 chests of strawberries per acre; Pajaro Valley loss in excess of $75,000.

Sacramento reports great loss to early figs; thin ice in many sections.

Frank H. Buck Company, Lodi, J. N. Ballantyne

As to crop prospect of this district wish to explain that any report made now may be changed later. Some of the estimates are from inquiry rather than observation, but will give some little idea of conditions.

Almonds are very light in most orchards, and nearly all varieties, and will probably run about 25 per cent. One report this morning was given me to the effect that the brown rot has been quite prevalent in many of the orchards. Excessive rain during blossom time proved quite detrimental.

The brown rot has also been quite extensive in apricot orchards, many trees being absolutely bare. Some trees show a full crop, but total tonnage will probably not exceed 25 per cent of normal.

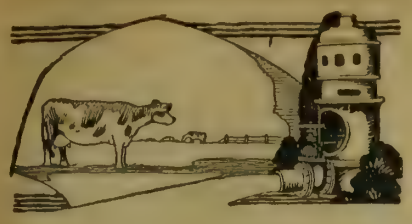
Cherries will probably average between 50 and 75 per cent.

While I have not had a complete report on peaches the majority show a very good setting and will probably run from 75 to 90 per cent of normal, although some of the Muirs are reported exceptionally light.

The pear acreage is small in this district, but showed an exceptionally heavy blossom and I would think will proably average around 75 per cent.

Some varieties of plums and prunes have dropped badly, while others seem to be in pretty good shape, and taking all varieties into consideration, 60 to 70 per cent may be about right.

(Continued on Page 555.)



The Deepwell Turbine

is a BYRON JACKSON achievement.

Perfectly machined, free from destructive vibration, rugged in construction, these pumps in themselves have built a distinctive fame around the name of Byron Jackson.

Their dependability, low cost of operation and ability to develop a maximum volume of water are features constantly broadening the circle of influence of Byron Jackson deepwell turbines.

RUMELY OilPull TRACTOR

Upkeep Expense on the OilPull Is Extremely Low

OilPull owners are frankly amazed after each season's work at the uncommon economy in cost of upkeep and fuel.

Practically every OilPull owner will tell you the cost of doing his farm work now is much less than the former cost with horses.

First, the fuel cost is extremely low—lower than that of any other tractor built. Fuel economy has been one of the chief characteristics of the OilPull from the very first. It is designed throughout—carburetor, motor, cooling system, etc., for the use of cheap fuels.

Then, the cost of upkeep is noticeably low. With every part made extra strong, there is little need for repairs. For example, "Old Number One," the first OilPull built 12 years ago, has had a total repair bill of less than five cents a day.

OilPull No. 1504 in California, 4½ years in service, has tilled 10,000 acres during that time and operated on the belt 300 days. The repair expense has not exceeded $400, piston rings have never been removed.

These are vital things for you to consider when you get ready to buy a tractor. A tractor which is constantly in the repair shop, instead of at work in the field, is a mighty unprofitable investment. You want the OilPull kind.

It will pay you to get the OilPull catalog.

Standardizing and Advertising California Vegetables

By H. H. Warner

A CLOSE study of the development of growers cooperative associations in California will reveal two distinct steps in the growth of those associations which have been successful in the marketing of their products.

First is the standardization of the pack and the common use of a distinctive brand or label on the products meeting the quality requirements. The second is the adoption of a definite program of national consumer advertising.

The growers of vegetables in Southern California are for the most part unorganized and the comparatively few local associations in existence have been compelled through lack of tonnage to place their marketing problems in the hands of some experienced shipper maintaining eastern selling connections. It may be too much to expect that the vegetable growers can ever be held together in an association to market their own products under a standardized pack for most of them are dependent upon the assistance of the shipper in financing their growing operations. It is not out of the question, however, for the independent shippers of these products, even under the existing keen competition, to unite on these two matters of standardizing the pack and of national consumer advertising.

Although there is considerable variation in the quality of the pack put out by various shippers, when one compares crates of these commodities from California with barrels and hampers of the same items from other states, it gives the impression of our stock being pretty well standardized. There is much to be done along this line, of course, but even now with the splendid standardization laws of the state in force there is not much chance of gross deception being continually practiced.

The per capita consumption of lettuce, cauliflower, celery, cabbage, root vegetables, etc., has increased tremendously since the advent of the refrigerator car and each year shipments of these vegetables are increasing not only from California but from other competing sections. This has all come about without a particle of consumer advertising and it is reasonable to presume that the consuming capacity of the people of this country for fresh vegetables, especially during the winter months, has scarcely been scratched on the surface. Other sections are adopting California ideas of packages and grading and are affording active competition in eastern markets, with a more favorable freight charge.

There seems to be no sound reason why the shippers who are now interested in the movement of California vegetables should not unite on an advertising program designed to reach the ultimate consumer and thus increase the per capita consumption of these products. It is true that such a campaign would have the result of also stimulating the demand for the same products from other competing sections, but many national advertising campaigns confronted with the same situation are none the less profitable to the advertisers.

The national advertising of foods and food products has developed in recent years to a highly specialized state and readers of national publications of wide circulation are thinking more about what they place on their tables than they used to. The selling of fresh vegetables has a particularly strong appeal on account of the increasing importance being given to this class of food by physicians the country over. Raw vegetables like lettuce and celery are credited with containing the very important vitamines considered so necessary in the modern diet. All green vegetables contain certain mineral salts essential to the health, and certain vegetables such as spinach and carrots are considered of great importance in the growth of the child. These thoughts and many others would provide plenty of "copy" for the advertising agency.

Scarcely an issue of certain weekly publications does not contain one or more fulll page advertisements telling of the advantage of certain kinds of wood or other building material, advertisements paid for by an organization of competitors who have joined their forces in putting over a national program of advertising. The same plan is feasible when we consider Southern California vegetables, and unless the shippers themselves take advantage of this opportunity the growing sentiment for one large cooperative enterprise will gain headway by using this idea as an organization argument.

A Strong Demand for Lettuce

With the shipments of lettuce from the Imperial Valley practically at an end, the movement of locally grown lettuce is increasing daily. Approximately 3,500 cars were shipped out of the valley for the season, and while the growers have not made a great deal of money, the deal on the whole has been more satisfactory to both growers and shippers than last year. This in spite of the greatly increased freight rate which at the opening of the season made it appear impossible to move the crop and even meet the cost of freight and packing. The quality of the Imperial Valley lettuce has been equal to that of past seasons, although there was an oversupply of small sizes which were sold at a discount.

Each year after the "valley deal" winds up there seems to be a strong demand in the Eastern markets during the month of April, especially before the homegrown stock begins to be available. As a rule the lettuce produced around Los Angeles is not hard and well headed as that grown in the Imperial Valley, and when both kinds are available the latter brings a premium in terminal markets. Just now, however, under the prevailing strong demand for Iceberg lettuce this difference in price is not so apparent and cars containing desirable sizes have sold recently on the New York market for as high as $6 per crate on a jobbing basis.

Last year at this time the situation with regard to the market in the East was practically the same, but owing to the railroad strike empty cars were at a premium and shipments remained light. This season, with a correspondingly strong market and the Imperial Valley competition out of the way, growers in the Los Angeles district are receiving very satisfactory returns.

In the face of a limited supply and a strong Eastern demand the local growers are profiting from the keen competition between some 15 or 20 independent shippers. In ten days time the price paid to the grower has jumped from 75 cents to $1.75 per field crate and whole patches are being bought outright. Last year the price went still higher but the more conservative operators, having in mind the increased freight rate, are beginning to hesitate on rolling cars unsold, and are insisting on loading only for cash California buyers.—H. H. W.

BETTER TOMATOES

The National Canners Association has established a bureau of research, and one of the investigations which it is making has to do with developing a tomato which has a better red color. The canner naturally wishes a tomato which will remain a bright red when the canning process is complete, hence "tomato pigment studies." The scientists are endeavoring first to develop and standardize a method for rapid and simple measurement of the amount of lycopin (red color pigment), and, second, to determine whether there are any constant differences in different strains, and if so, through pure line breeding to isolate and propagate the strains having the greatest amount of lycopin and consequently the best red color.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Road Right

There is an old road leading to a bay on which there is a cannery and government owned shed. A boat belonging to the cannery lands at the foot of this road and brings freight for anyone desiring it. The road has been in common use for a long period. A new owner has taken the property and he now locks the gate and gives one key to the government employe and the other two to the cannery employes, but prohibits all other persons from using this road. Has he the right to keep others from using this road?—Subscriber, Reys.

As frequently stated heretofore, these questions of roads are so much ones of the history of the roads and their use that it is practically impossiblt to give an opinion that is of any real value. From the facts stated it would seem, however, that the road has been employed by the public and has thereby been dedicated to the public, that it is dedicated and to an extent acknowledged by the admitted right of the cannery and government men to pass over the road. However, the question states no time in which the road has been used, the character of the use, nor the mode in which the use commenced.

Community Property

A ranch is purchased in the name of husband through the joint labor of husband and wife. Is it community property? In case of divorce has the wife any right in the ranch?—Subscriber, El Centro.

All property acquired after marriage by either husband or wife, or both, is community property, except such property as is acquired by gift, bequest, or devise, or the rents, issues, or profits of such separate property. In the case of a divorce the property rights are largely within the discretion of the court. In case the decree is ordered for adultery or extreme cruelty the community property may be assigned to the respective parties in such proportions as to the court, from all of the matters of the case and the conditions of the parties, may deem just. In any other case the property shall be equally divided. The usual provision is that the husband shall undertake the support of the children and that the children be placed in the custody of the wife.

Deed to Husband and Wife

Where a deed is made in the name of husband and wife what interest has the wife in the property upon the death of the husband, no children surviving?—Subscriber, Santa Rosa.

In case the deed stands in the name of the husband and wife the presumption is that the wife is a tenant in common of the property conveyed; that is to say, she has an undivided one-half interest in the property. This is irrespective of any disposition by the husband by will or irrespective of the interest that she may have by reason of the fact that it is community property. In such a case, upon the death of the husband, if the property was in fact community property, the wife would first be entitled to her undivided one-half of the property as tenant in common and then she would be entitled, in case there were no child, to one-half of the husband's one-half, if such were held to be separate property. The undisposed of one-half of the husband's one-half would in the absence of a will go to the next of kin of the husband.

Selling Water to Neighbor

A neighbor wishes to buy water to supply a watering trough in his pasture. He offers to lay the pipe and pay a reasonable amount for the water. Would I be involved with the railroad commission by selling this water to him? If I should make a contract to furnish this water for two years would he acquire rights after the term of the contract?—San Miguel.

Under the broad terms of the public utility act the term "public utility" is defined as including every person who delivers a commodity to the public or any portion thereof. The term "public or any portion thereof" is defined as including the public generally or any limited portion of the public, including a person for whom the service is performed or commodity delivered. Undoubtedly, under this explicit definition, even a little matter such as that embraced in the foregoing question would render the party furnishing this water a public utility and under the control of the railroad commission. However, as a matter of practice, the railroad commission has not sought nor does it desire to extend its authority and powers to such individual transactions. The contract concerning the water would be a mere license or rental and no subsequent rights would accrue thereunder.

Check Not Cashed

I gave a man living within three miles of a bank a check as part payment on a ranch purchase. The bank continued business for ten days after that time and then closed. The depositors got 50 cents on the dollar. Does the holder of the check lose the difference or am I required to make it up?—Subscriber, Modesto.

The case with respect to liability under the above state of circumstances has in several instances been brought before the courts and there is more or less conflict of authority. Lately it has been sought to reconcile these different authorities by what is known as the "Uniform Instrument Law," which is now in force in this state. In this law it is provided that a check must be presented for payment within a reasonable time after its issuance or the drawer will be discharged from liability thereon to the extent of the loss caused by the delay. In respect to the term "reasonable time," the law provides that regard is to be had to the nature of the instrument, the usage of trade or business with respect to such instruments and the facts of the case. The courts have held that whether or not a person has presented the check within a reasonable time is a question purely of fact to be determined at the trial; in case of a bank failure, a delay of 14 days was not an unreasonable time. In another case, that of a vendor of land, to whom a check was given for a portion of the purchase price of the land, a delay of somewhat less than ten days was unreasonable, and the court determined that the vendor must stand the loss due to the insolvency of the bank upon which the check was drawn. It would seem that from the facts stated that the delay in this case might be considered unreasonable, in which event the holder of the check would have to bear the loss.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Curl Leaf

I am writing to you in regard to some five year old peach trees that have in the last few days developed curl leaf to some extent. These trees were properly sprayed with lime-sulphur. Is there any chance of saving them now and if so what would you suggest as best treatment?—Subscriber, Acampo.

We fear there is little help for these trees though a spraying with weak Bordeaux, 3-5-50, may prove helpful in preventing further spread of the trouble. If you had sprayed with the Bordeaux instead of lime-sulphur when the trees were dormant and just before bursting into bloom you would perhaps have prevented the more severe manifestation of this trouble.

Leaf Curl

Can you tell me what to do for my peach tree? I believe I pruned it too much. I only shaped the tree. The gum is coming out where the limbs were cut off. I put paint on the place. No fruit set on it and the leaves are curling. Sandy loam, well worked and fertilized with hen manure.—Subscriber, San Gabriel.

This appears to be simply an aggravated case of leaf curl which it is impossible to remedy this late in the season. Another year spray as early as possible after the leaves are off and again just before the swelling of the buds in the spring with Bordeaux, 5-5-50. See other query above.

Pear Leaf Blister Mite

Am sending pear leaves showing yellowing and discoloration, mostly in spots. What is cause and remedy?—Subscriber, Murrietta.

The pear leaves you sent in show the work of the pear leaf blister mite. This mite feeds under the bud scales and as soon as the leaves appear in the spring they bore into the under side of the leaves and deposit the eggs from which young mites emerge and cause the galls or blisters which later turn brown in color as indicated on the dry leaves which you sent. I very much question whether this pest is serious enough to warrant the expense of any treatment. However, if you consider that sufficient damage has been done, the treatment for next year is to apply a spray of lime-sulphur either in the fall just after the leaves have fallen or in the spring just after the buds begin to break. It is really too late now to accomplish anything until fall. Your pear trees are likely to be infested with the San Jose scale, in which case there would be this additional reason for applying lime-sulphur spray, and you can get the scale and the mites at the same time. The San Jose scale may be the cause of your trees dying, though, of course, you may be acquainted with the work of this insect.—H. J. Quayle.

Killing Eucalyptus

As to killing eucalyptus, the method suggested in the Cultivator of February 26 is effectual, but it is much more expensive than is necessary. I believe that the method given below will save a large part of the cost of killing eucatyptus roots. After the tree is cut down the stump will start perhaps a hundred sprouts. When they are a foot long take a sharp hatchet and cut them off; time two minutes. Some weeks later there will be perhaps 50 new sprouts. Cut them off as before; time one minute. Some weeks later there may be 25 new sprouts. Destroy them; time one-half minute. Some weeks later the most vigorous stumps may have a dozen sprouts. Cut them; time one-fourth minute. Most of the trees are dead now. If ahy are living give each one-eighth minute. Probably they are all dead, now. If not, another treatment gets the last one. Time in all, five minutes per tree. If the trees are watered they are harder to kill. It takes a little longer, that is all. It is surprising how soon blue gum stumps will rot in the ground. Some other species may take longer.—A. C. Pickett, Riverside.

Meat of Boar

I have five months old boar pig which I wish to butcher. Will the flesh of such animal be "strong" in flavor or unfit for food?—Subscriber, Alhambra.

Possibly the meat may be sweet and all right, but there is possible danger of poor flavor. The question was referred to Mr. Gordon and he writes: "It is undesirable to use the meat from a boar for pork. It would be more desirable to alter the boar and feed him for a month or six weeks, at which time he would put on some fat and the meat would be much more desirable. However, the meat from a boar only five months old would not be found very objectionable and if it is necessary to butcher him immediately, the meat can well be utilized."

Computing Horsepower

How is the S. A. E. rating of the horsepower of engines computed?—Subscriber, Hemet.

Answer by Prof. L. J. Fletcher, U. C.: Horsepower is the product of a force moving a certain distance in a certain time. In a gas engine this force is the pressure on top of the piston head. The distance is the length of the stroke, and the time is the number of strokes the piston makes per minute, which is reduced for convenience to the total number of feet traveled per minute. The unit of force is the pound, and the unit of power is the horsepower. If a force, such as a pull of 1,000 pounds, is exerted by a tractor which moves at the rate of two and one-half miles an hour, the distance this force will move in a minute times the 1,000 pounds will give a product in "foot-pounds" which, in this case, is equal to 220,000. 33,000 of these foot-pounds per minute is the equivalent of one horsepower, so the above tractor is exerting 220,000 divided by 33,000, or 6 2/3 horsepower.

In figuring the horsepower developed by a gas engine a certain per cent of the pressure of the expanding gas on the piston head is delivered in a turning effort or torque to the crank shaft or pulley. This power is frequently spoken of as the brake horsepower. The S. A. E. (Society of Automotive Engineers) formula for obtaining this brake horsepower is D squared. multiplied by N, divided by 2.5. (D is the diameter of the cylinder in inches and N the number of cylinders.) In deriving this formula two things are taken for granted in the operating of the motor: one is that the piston speed is equal to 1,000 feet per minute, and the second that the average pressure on the piston during the working stroke is 90 pounds per square inch. Because of the fact that in the modern engines piston speeds

often run up over 2,000 feet per minute and mean effective pressure over 120 pounds per square inch, it is evident that the formula often gives a result much below the horsepower which the motor can actually develop.

WHAT WILL THE HARVEST BE?

(Continued from Page 551.)

We have considerable damage in some of the vineyards from frost, causing a good deal of set back, but at present I would think there would be anyway 75 per cent of a crop.

The temperature dropped below 30 degrees since the foliage started on two occasions in this immediate vicinity, and a report reached us yesterday that it had gone as low as 22 per cent in the Clement district, about 12 miles northwest of Lodi.

FRUIT IN GENERAL

From notes for week ending April 9, received from the bureau of agricultural statistics at Washington, we give the following summary:

Kansas—A few peaches and cherries have escaped the Easter freeze. Early apples, Jonathan and Stayman Winesap, seriously injured. Ben Davis, Gano, Winesap, York Imperial and Grimes quite generally escaped injury. Berries apear uninjured.

Louisiana—Strawberry crop is still moving in large quantities from the Tangipahoa strawberry section. Good prices for strawberries are being received.

Maryland—Serious damage reported by the freeze of March 27 and 28 to peaches, pears, early apples, plums, cherries and early strawberries.

Michigan—Fruit beginning to bloom in southwestern counties.

Nebraska—Some further damage expected to tree fruits from the low temperatures of the last two days of the week. Very little damage reported to small fruit as yet.

New England States—Apples were not far enough advanced to be hurt much by recent cold snap but peaches may later show the effects by a light set of fruit.

New Mexico—Indications are that practically all the fruit of all kinds has been killed, including apples and pears, as the nights of both April 6 and 7 were very cold.

North Carolina — Fruits have not been damaged as much as first thought and especially so in the Piedmont territory. Mountain counties suffered most.

Oklahoma—Some peaches and cherries survived the recent freeze. Apples, pears and berries were severely injured but promise one-fourth to one-half crop.

South Carolina—Condition of strawberries excellent.

Tennessee—Peaches, pears, cherries and plums were seriously damaged by frost in the central and western sections. Apples not so badly damaged. Strawberries checked in growth and many killed.

Utah—Apricots practically all killed and peaches and cherries considerably damaged. Apples and pears believed unhurt so far.

Virginia—Stone fruits practically a failure except in extreme southern section. Estimates of apple prospects vary from total failure in some sections to 50 per cent of a full crop in others. At present hardly more than 15 per cent of a full crop for the state is indicated.

Arkansas—Frost damage to apple crop as yet indefinite but probably about 10 to 20 per cent of a crop left. Peach crop fairly favorable in the northeastern section along the foothills and as far north as Lawrence County. Strawberry acreage shows increase. First express shipments from White County made on April 4.

California—Grapes in San Joaquin valley show greatest injury. Apricots affected with brown rot.

Colorado—Reports show considerable damage to cherries and apricots and possibly slight damage to peaches and pears in Mesa, Delta, Montrose and Fremont Counties. Apples apparently uninjured.

Delaware — Damage to peaches, pears, plums, cherries and apples seems to have practically ruined the prospects of many growers. Late varieties of apples believed uninjured. Early strawberries suffered severely.

Florida—Early citrus prospects continue excellent. Crop moving as fast as conditions will permit. Condition of pineapples on the East Coast improving. Peach prospects good; pears showing blight.

Georgia—Fruit practically uninjured by cold weather. Peach prospect good. Adult curculios are reported as appearing in the peach district in Fort Valley.

Idaho—Early cherries, apricots and peaches in bloom when cold weather came. Apples, prunes and pears not far enough advanced to be injured.

Illinois—Recent frost caused much damage. Reports indicate that apricots have been generally killed; peaches, pears and plums badly injured in central areas and killed in the south; apples, badly damaged in the south with the exception of a few late apples; strawberries generally killed in southern third of state.

Indiana—Damage to fruit by the freeze March 29 is now thought not to be as great as at first reportsd.

Iowa—Plums and pears probably injured; winter apples believed to have escaped. Considerable apprehension felt as to safety of fruit buds, especially peaches.

SCHOOL AGRICULTURAL FAIR

It would have been an education to many farmers and ranchers to have attended the agricultural fair held by the Pasadena high school students, Friday and Saturday of last week. The club students had completed their contest and were ready for the awards. Vegetables and other agricultural products, domestic products, poultry and livestock grown and developed by the boys and girls were on exhibition, and in most cases showed no indication of amateur effort. In the pig club feeding contest Herbert McDade won first prize with his Berkshire gilt, making a 50 per cent profit. Warren Olson won second on a Poland China with a 49 per cent profit; William Schilling, third on a Duroc-Jersey with 45 per cent.

In the best hog contest Herbert McDade's Berkshire won over all breeds, with Warren Olson's Poland China running second.

In the free for all schools contest the Inglewood Union high school took first on Berkshires and Jerseys, Herbert McDade taking first with his Jersey heifer in the Pasadena entries.

G. E. Gordon, assistant farm adviser of Los Angeles County, did the judging and complimented the boys highly on their results. He said most of the entries were so good he regretted to be obliged to place some of the animals second and third.

THE TWO GARDENERS

By T. Dabney Marshall in The Flower Grower

I should be glad,
But do get mad,
When people speak of my "good luck.'
"We don't know why,
But ours all die.—
How do you get such splendid truck?

I fume and snort
And straight retort:—
It is no such a thing.
It's dig and toil,
Perspire and broil,
If things to bloom you'd bring.

Your seed you sow,
And think they'll grow,
While you attend the picture show;
You moan and sigh
And almost cry,
When they refuse to blow.

You say you can't
Dig round this plant,
It is so cold and damp;
Then open eyes
In hurt surprise,
Should it from life decamp.

When it gets hot,
You straight absquat—
Ulate for shady bank.
With such neglect,
You can't expect
Your blooms with mine to rank.

I scratch and scratch
My garden patch,
Nor fear the dirt and mud;
I stoop and bend,
Each plant attend,
Though it should rain a flood.

I kill each weed,
Whose hungry greed
Would make my plantlets lean.
I cannot rest,
Nor life have zest,
Until my garden's clean.

With "curkle" burrs
And prickly furze,
I wage eternal feud;
But Oh! Alas!
The Coco grass,
I have not quite subdued.

On chewing gum
And things as bum,
You make your money fly;
Insecticide
You won't provide,
And pass bug poisons by:

While of vermine
And strong aphine,
I buy a good relay;
With Paris Green
And nicoteen.
I daily dust and spray.

In magazines
You read of queens
By husky heroes wed;
You still pursue
The villians, too,
Till they are copped or dead.

A garden guide,
It is my pride;
I study catalogues;
Each blossom's name
I can proclaim,
Tho' oft my tongue it clogs.

And tho' success
My toil may bless,
For what I've got I paid;
And so 'twill be
I think, with me,
Till in the ground I'm laid

It may be tragic,
But there's no magic,
When pretty pansies perk;
My lazy dear,
Lend me your ear,
The only magic 's WORK.

HALF WAY AROUND THE WORLD

By Rose Wilder Lane in The Red Cross Bulletin

RAGUSA, Dalmatia, March 16. —Human sympathy is wide enough to encircle the earth; the Red Cross that is a symbol of that sympathey is everywhere the sun shines. But our imagination is not yet as great as the need for it. There is no doorstep in America on which a naked new born baby could lie wailing and disregarded; not a woman in America who could not find somewhere in her house something to wrap around the baby to cover him and keep him warm. But Ragusa is not on the doorstep of America; it is half around the world.

The sun is just beginning a new day in Ragusa. (The theaters are lighting Broadway with their electric signs; the children of the Middle West are getting their lessons after supper; the headlights of automobiles are flashing along the boulevards of the Pacific Coast.) The sun is rising behind the gaunt gray mountains bare of trees and shining down on the gray walled town that was the proudest city of the Adriatic eight centuries ago.

Ragusa is still the walled city that defied the Venetians when Dalmatian sailing ships ruled the seas of the known world. The road that goes into it is cut 60 feet deep through gray rock and arched overhead with stone bridges and towers. The moat—filled now with growing trees—is wide; the outer wall, guarded by watch towers and battlements, is pierced high overhead with holes, behind which the archers stood—pigeons are nesting in them now. The narrow road goes between the towers, beneath a long arch of crude stones, and winds between the outer and the inner walls to the second guarded gate. Then one is within the old city, gray white and dazzling in the bright sunlight. No carts can go through the narrow streets between the low, square houses of stone; these were built only for the passage of donkeys, and men on foot; they go up and down stone steps, and over them are arches that are bridges from second floor to second floor. The only open space is the square, the public meeting place, paved with heavy cubes of the gray rock, wide as an American village street, and crowded with men and women—Albanians, Turks, Herzegovinians, Serbs, Croats. At one end of it, above their heads, our American flag is a bugle note of color against the rough stone wall, and beside it is the Red Cross on the white banner.

Prince and Princess

You go up a narrow, winding stairway of stone to the offices. A heavy wooden door opens into the bare room; there is a crude wooden table—wood is rare and hard to get in Dalmatia—and a packing box. Captain Spratt of Jacksonville, Florida, is talking in French to a ragged, unshaven man:

"I am sorry—the only thing I can give you is a hospital suit—convalescent garments. It will be clean and whole, but it is hardly the thing you would want to wear outdoors."

"I shall be glad to get it, thank you," the man replies. He looks like a man you would pass as a tramp on an American road, but his French and his manner are perfect. Who is he? He is Prince Chakhevski, one of the Russian refugees. And he is quite happy. He has found a job; next week he will be earning ten dinars a day, or almost 20 cents. With that and another suit, so that he can change and wash and mend his old one, he will be entirely content.

Captain Spratt is pleased and interested; he asks questions. The job, the Prince says, is that of beekeeper. Does he know anything about bees? Not a thing. Isn't he afraid the little honeymakers will sting? "Ah, yes, monsieur! But what would you? One must live as best one can, and it is a job. I have looked for one so long, I am pleased to have this; and no doubt, with the use of my utmost intelligence, I shall become a good beekeeper. The Princess," he adds, warmed by sympathy, "also has a job."

"Yes, I know; isn't it fine!" says Captain Spratt.

The Princess is earning 15 dinars a day sewing in the Red Cross workrooms. Mrs. Spratt, the Captain's wife, is not one of the Red Cross personnel; but she is in Ragusa, and that makes all the difference in the world. She was unable to be in Ragusa without doing something and so she organized the sewing rooms. Cloth was sent from the army stores in Paris, six sewing machines were brought from America, and the Russian refugees began to clothe themselves in whole new garments.

Workrooms and Workers

Up on the hill above the walled city is the great Hotel Imperial, the hotel that was crowded with glitter and luxury in the days before the war, when Ragusa was the Riviera of the Adriatic, and during the season yachts from all the world lay at anchor in the harbor. The sewing rooms are on the first floor and they are like ten thousand Red Cross workroms at home. No, not like the Red Cross workrooms at home now, but like the places that were in every small American town during the war, when, after dinner, we all went down to the vacant store on Main Street and spent the afternoon sewing piles of little cut-out garments.

The Red Cross workroom in Ragusa looks like that. But only at first

The Cultivator Patterns

BE SURE TO SEND SIZE

3587. Child's Romper. Cut in four sizes, 2, 3, 4 and 5 years. A four year size will require 2¾ yards of 36 inch material. Price 10 cents.

3579-3570. Ladies' Costume. Waist 3579 cut in seven sizes, 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3570 cut in six sizes, 24, 26, 28, 30, 32 and 34 inches waist measure, and requires three yards of 54 inch material for a 28 inch size for the skirt, and three yards of 36 inch material for the waist for a medium size. The width of skirt at the foot is 3½ yards. Two separate patterns, 10c for each pattern.

3390. Girl's Dress. Cut in four sizes, 6, 8, 10 and 12 years. A 10 year size will require 4⅜ yards of 36 inch material. Price 10c.

3400. An "Easy to Make" Apron. Cut in four sizes, small, medium, large and extra large. A medium size will require 2¾ yards of 27 inch material. Price, 10 cents.

3566. Child's Dress. Cut in four sizes, 1, 2, 4 and 5 years. A 2 year size will require 2¼ yards of 36 inch material. Price 10 cents.

3558. Ladies' Dress. Cut in seven sizes, 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 4⅞ yards of 40 inch material. The width of the skirt at the foot is two yards. Price 10 cents.

3564. Girl's Dress. Cut in four sizes, 6, 8, 10 and 12 years. A 10 year size will require 4¼ yards of 27 inch material. Price 10 cents.

3573. Ladies' House Dress. Cut in seven sizes, 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5⅞ yards of 36 inch material. The width of skirt at the foot is about 2¼ yards. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK**. Therefore, we promise to deliver all patterns ordered within **TWO WEEKS**; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

glance. There are the six sewing machines, the tables, the piles of cloth. But there are no scraps lying on the floor, and no wads of basting thread or snowfall of clipped thread ends to be swept up and thrown away when the work is finished. And the women are not well dressed and plump and talkative; they wear makeshift garments—blue cotton blouses and heavy shirts and worn shoes; their hair has been combed by hands that have long ceased to trouble with the useless detail of personal appearance and they do not look up from their work. They sew, steadily and desperately, hurriedly, but with the utmost care not to waste even a snip of thread. Their very fingers know how precious a garment is.

The workrooms have been running for two months. In that time they have turned out 30,000 garments—coarse underwear for women and men, cotton blouses, overalls. The material was brought from America; the thread was brought from America; the needles, the sewing machines, the sewing machine oil, were brought from America, across the Atlantic, up the Mediterranean, half the length of the Adriatic. There is no cloth in the Balkans.

It is hard to realize just what that means. Cloth is so much a part of our lives that we take it for granted. We complain, with our closets full of old clothes, with towels in our bathroom, dust cloths on their nails, neat rolls of bandages in the medicine cabinet, handkerchiefs in our purses because we want new summer dresses and the price of organdie is simply frightful. One must imagine all these things gone and nothing to take their places, in order to know the value of cloth.

No Such Word as "Waste"

With the scraps left when overalls were cut out, blouses were made; with the scraps left, baby dresses are being pieced together. For the babies of Jugo-Slavia are being born in stone huts among the mountains, with nothing to clothe them in.

"The average mother in Montenegro," says Miss Elsie Benedict, director of the Junior Red Cross there, "would commit murder to get a piece of soft cloth. I mean that, literally. She would kill for it. They have absolutely nothing to wrap around their new born babies but the coarse, hard woolen that they spin and weave from the wool of their own sheep. It is like knives to a baby's skin. We find them raw and bleeding, crying—but what can their mothers do? The baby will freeze if it is left naked and the coarse blanket is the only thing with which to cover it. They are lucky to have even that."

From Ragusa Mrs. Spratt and the other Red Cross workers remember longingly the riches of America—the yard of fine, soft cloth that costs only 25 cents, the half used spools of thread in sewing machine drawers, the sewing machines themselves, standing idle through whole days, and the idle hours of the women who were doing so much with one afternoon a week three years ago.

The Red Cross workers in Europe have estimated carefully that one million babies will be born on this side of the earth this summer to mothers who will have nothing with which to clothe them, and it is a long and costly affair to bring a sewing machine from New York Harbor to the coast of Dalmatia. There are a million women in American who could make a complete layette in four rather happy afternoons if our chapter rooms were open and busy again. They would use the idle time, the idle machines, the cheap cloth and thread, and the babies of Europe would be clothed quickly and simply.

It seems, from here, such a simple thing to do—as simple as it would seem to the woman at home to find something soft and comfortable for the naked baby if it were on her doorstep. But perhaps it seems so because, to us here in Ragusa, the baby is on our doorstep; and there is no soft cloth in Jugo-Slavia, no thread, and only a few sewing machines.

MICKIE SAYS:

"Th' man who has a thing t' sell
Who goes 'n whispers down a well,
Ain't near so apt to collar th' dollars
As him what climbs a tree 'n hollers.
—Shakespeare."

ANSWERS TO HOUSEHOLD QUERIES

By Mrs. A. Stainton, San Francisco

For Mrs. L., Winters—Sugar Pie

One cup each of granulated sugar and syrup, two well beaten eggs, a small piece of butter (about a tablespoon), pinch of salt, vanilla to taste, tablespoon lemon juice. This mixture should be beaten up well, then poured into a good crust; bake until it is of the consistency of custard.

For A. B., Orange—Jelly Crystallizing

If the sugar does not all dissolve and mix thoroughly with the fruit juices some of the sugar used is likely to crystallize out after the jelly stands for a while. These crystals may be seen throughout the jelly.

A storage place that is too warm will cause the sugar in preserves to undergo its crystalline change and then the preserves will be full of hard candied sugar. The perfect storing place for jellies and preserves requires coolness, dryness and plenty of air circulation. On the floor under the shelves is a good place. The cool, equable temperature seems to be just about right. In front of them hang a thick curtain.

The addition of one-half teaspoon of glycerine to a pint of jelly or preserves just before pouring into the jar will prevent formation of crystals.

For St. Helena Subscriber—India Pickle

To each gallon of vinegar allow 6 cloves of garlic, 12 shalots, 2 sticks of sliced horseradish, ¼ pound bruised ginger, 2 ounces whole black pepper, 1 ounce long pepper, 1 ounce allspice, 12 cloves, ¼ ounce cayenne, 2 ounces mustard seed, ¼ pound mustard, 1 ounce turmeric, a white cabbage, cauliflowers, small round pickling onions, etc., etc. Cut the cabbage into slices and the cauliflowers into small pieces; sprinkle salt over them in a large dish and let remain two days. Then dry and put into a very large jar with garlic, shalots, horseradish, ginger, pepper, allspice and cloves in above proportions. Boil sufficient vinegar to cover them, which pour over and when cold cover to keep free from dust. As the other things for the pickle ripen at different times, they may be added as they are ready. These will be radish pods, French beans, gherkins, small onions, nasturtiums, capsicums, chillies, green tomatoes, plums, peaches, lemons and anything else you wish. As they are gathered they are washed in a little cold vinegar, wiped, and simply added to the other ingredients in the large jar, only being careful to have them covered by the vinegar. If more vinegar should be needed, be sure to boil it before adding to the rest. When you have collected all the things you want, turn all out into a large pan and thoroughly mix them. Put the mixed vegetables into smaller jars, without any vinegar, then boil the vinegar again, adding more with spices in proportion, if necessary, to fill the jars. Pour the vinegar boiling hot over the pickle, and when cold, seal. If the pickle is wanted for immediate use, the vinegar should be boiled twice more, but the better way is to make it during one season for use during the next. It will keep for years if care is taken that the vegetables are quite covered by the vinegar.

HOUSEHOLD NOTES

There are few homes but harbor one or more good umbrella frames with wornout covers. Nice new covers can easily be made for these frames from black sateen or any preferred material. Rip out one section of the old cover and use for a pattern. Use the selvage for the bottom of the new piece each time, reversing the pattern so as to do this. To mend an umbrella, take a small piece of sticking plaster of the same color as the cover and soak it in water until soft, then place this smoothly under the hole and let dry.

Before tacking down oilcloth or linoleum, if you would have it smooth, let it lie in place and be walked on for several days. You will have no trouble in keeping it bright if equal parts of milk and water are used for cleaning.

Sew strips of buckram along the edges of rugs which have a tendency to curl up.

Essentials of Animal Breeding

By George M. Rommel, Chief, Animal Husbandry Division

(No branch of agriculture has been surrounded with more "hookum" than has been the breeding of farm animals. This "hookum" has extended all the way from "pre-natal influence" to the control of sex and color. In the hope of correcting many of the unfounded beliefs we take pleasure in publishing the following liberal extracts from Farmers' Bulletin 1167.—Editor.)

IN dealing with the subject of heredity we must recognize clearly the following facts: First, animal and plant forms, as a rule, have developed gradually and very slowly, by very small changes; in short, by the process known as evolution. Second, whatever an animal has, so far as its inheritance is concerned, it gets from its parents—they get theirs from their parents, and so on clear back to the beginning; nothing was imposed from the outside. For the present, accept this fact without question. We shall try to make it clear later. Third, a very clear distinction should be drawn between the effects of inheritance and the effects of food and environment.

Everyone who is at all familiar with domestic animals knows what a wonderful effect the food an animal eats has on its development, especially when it is young. It is also known that the younger an animal is the more readily it is influenced by its food. Now, from the very first moment that a young animal begins to develop, from the very instant that growth begins with the fertilization of the egg cell, it receives food from some source or it dies. When it is only a single cell it is being fed. If a young animal after birth is easily influenced by its food, how much more will the delicate little creature, known as the fetus or embryo, be influenced by the character of its food supply. A clear recognition of this fact will explain many occurrences which are often attributed to supernatural influences, and, at the same time, the breeder who recognizes this fact will not neglect proper attention to the nourishment and care of the pregnant mother as well as the nursing animal.

Accidents and disease also are important in their effects on the growing embryo. If an incubator is neglected on a cold night and the eggs become chilled, the hatch is seriously impaired and a large number of chicks are killed in the shell. If an in-foal mare is subjected to very heavy strains or forced to pull extremely heavy loads, the foal may be born too soon or even killed in the womb. Contagious abortion may get into the herd without the owner's knowing it and cause the loss of a large proportion of calves. Heredity, however, has nothing whatever to do with any of these things.

The Unit of Life

The smallest unit of life is the cell. A single cell is very small, usually of microscopic size. It is surrounded by a membrane, and each cell usually contains a nucleus—a sort of center of things that go on in the cell. The animal body contains millions of cells, but those in which we are most interested at this moment are the cells from the union of which a new animal life begins. They are the germ cells. They contain the hereditary material which determines the identity of each individual and which is known as the germ plasm. This is the bit of life which passes down the line of descent with each succeeding generation. It appears in the mother in the egg cell, and in the father in the sperm cells. This material is composed of elements which seem to be handed on unchanged from generation to generation. Only a portion of the elements in the germ plasm of the parent goes into each egg or sperm, however, as is explained in more detail later. The element of chance enters to such an extent in determining which elements shall go into a particular germ cell that there may be a marked dissimilarity among individuals which are members of the same family. Even more important than the influence of food on the developing embryo and the young, growing animal is the operation of chance in determining the identity of the new life.

The cells from which all life starts are developed in the generative organs. The egg (the female cell) is dveloped in the ovary of the female; the sperm (the male cell) is developed in the testicle of the male. In mammals each female has two ovaries, one on each side, situated in the abdominal cavity. Connecting the ovaries with the uterus are the Fallopian tubes. The uterus is the womb, the chamber in which the young fetus develops until it is ready for birth. The uterus connects with the vagina, through which the sperm is introduced into the uterus and down which the young animal passes at birth. The genital organs and the urinary organs have the same outlets from the body.

When the egg matures in the ovary it passes down the Fallopian tubes into the uterus. If no sperm is introduced, the egg is thrown off infertile. In female animals an egg matures at fairly regular intervals, and this corresponds with some exactness to what is known as the period of heat or oestrum.

The period of heat varies considerably in different species and in different breeds and individuals of the same species. It usually occurs at intervals of about three weeks. In mares it appears on the ninth day after foaling, lasting two or three days. In cows it appears in from three to four weeks after calving when the cow is not suckling a calf, and in from six to eight weeks if she is. The heat period lasts only about one day in cows. Sows come in heat three days after farrowing, and not again until a week after the pigs are weaned. In sheep, except for a few breeds, such as the Dorset, ewes in North America ordinarily come in heat only in the fall for a number of periods of two or three days each at intervals of from two to three weeks.

Females usually accept service only during the period of heat. It seems to make little difference when service is made, whether early or late in heat. As a rule, not more than one service is necessary during one period of heat to insure conception. After conception takes place the female does not generally come in heat again during pregnancy.

Male cells, or spermatozoa, are carried in the seminal fluid. There is only one egg, as a rule, except in such animals as hogs, rats and others, which usually have several young at a birth. There are, however, millions of sperm cells, but only one of them is needed or used to fertilize one egg. Let us now proceed to a consideration of the first step in the formation of the new life.

The Beginnings of Life

The life which results when two animals are mated has its controlling elements in the nuclei of the germ cells. The nuclei contain a substance called chromatin, represented by very minute bodies called chromosomes Chromatin and chromosomes are found in all cells all over the body, and the number of chromosomes in each cell is the same for each species of animal. Except for the accessory chromosome (which determines sex), they are always in pairs. In many of the domestic animals and in man the number of chromosomes is between 40 and 48, depending on the species. Just why this number should be limit-

What Counts in a Car?

A CAR ought to be a good investment, and to be a good investment means that you must get more out of it than you put into it.

The Overland is that kind of a car, for the service and satisfaction that it gives is out of all proportion to the little that it costs.

To the economy of light weight it adds a riding comfort hitherto found only in expensive cars.

Overland Prices Have Been Reduced
The Time Payment Plan Is Very Easy

ed and invariable we do not know. It is no more remarkable, however, that each cell in the hog's body, for example, should have 40 chromosomes (which is the case) than that each normal hog should have four legs.

This is easily understood until we come to explain what happens when the egg cell is fertilized at conception. Obviously an egg with 40 chromosomes and a sperm cell with 40 chromosomes could not unite, because that would result in a cell with 80 chromosomes and only 40 is the rule. It just wouldn't work, any more than a pig with eight legs would work. Therefore, to prevent the doubling of the number of chromosomes at conception, nature puts the germ cells, both male and female, through a maturing process known as maturation, so that, just before the two unite, each has only half the normal number of chromosomes for the species, one from each of the pairs present before maturation. When the two cells unite, therefore, the fertilized egg has the usual number of chromosomes carried by the cells of the species. This process occurs only in the case of reproductive cells.

When two animals are mated, what happens? The reproductive cells have gone through the maturing process and are now ready for union. The sperm cells are active and move around until they come into contact with the egg. Several may surround the egg, but only one unites with it. The membrane surrounding the egg cell is pierced by the head of a sperm cell. The two become one and the egg is now fertile. It needs only nourishment to become in time a full fledged baby member of its race.

Food, of course, will have a profound influence on this little mite of life, but, so far as we know, the character of the resulting animal, its sex, its identity and its individuality, whether it is to be white or black, long-haired or short-haired, ring-streaked or spotted, are now settled by the laws of life. This minute cell now carries in itself all the force of inheritance from all the ancestors behind it to the beginning of life on earth. Every champion you or I have known began his career in just this way. Many, many influences stepped in and had an effect on his subsequent development. Some of these are easy to determine, but others are so obscure that theories and fancies have grown up to explain them.

What value has this information for the practical breeder? Can he use it in making his methods more efficient? He cannot use it directly, but indirectly it can be most valuable to him, becase it explains many things that otherwise are difficult to understand.

Suppose we are breeding animals in which the number of chromosomes is only four (two pairs). By the time both egg and sperm cells had gone through the maturing process and the egg had been fertilized, 16 different combinations would be possible, some of them no doubt differing very little from each other, but others having little mutual resemblance. In animals such as hogs, however, with 20 pairs of chromosomes in each cell, the possible combinations are almost infinite in number. (The number of possible combinations in this particular case is 1,099,511,627,776.)

These combinations are the results of chance. Here we have an egg with 20 pairs of chromosomes, about to mature. Twenty of these chromosomes only will be left when the egg is ready to unite with the sperm cell. What 20 will it be? Chance alone can tell, except that there will be one from each pair. Here comes the sperm cell, to mature which a similar process was gone through. Chance again determined that 20 out of the original 40 chromosomes should disappear and no determination can be made to show which 20 would prevail. But this is not all. The sperm cell does not come alone. It comes in swarms, but only one sperm cell penetrates the cell membrane and fertilizes the egg. What determines which of the thousands of sperm cells will be the one? Chance again.

The chromatin is the chief, if not the sole, determining factor in the development of the identity of the new individual, and the chromosomes are the agents by which this identifying process is carried out. When we think of the great number of combinations of chromosomes possible before fertilization is actually effected, we begin to understand why it is that members of the same family often do not look alike and why we have so many disappointments in breeding animals.

If chance is the sole factor in determining what chromosomes shall persist, where does intelligent breeding come in? Of what advantage is it to exercise care in mating? Why not leave it all to chance?

The simple answer to these questions is that we can lessen the probability of undesirable working of the laws of chance by increasing the uniformity of the chromosomes. That is done by careful selection to a certain type and by working with a group of animals whose ancestry is known. The highest examples of such methods are found in the work of breeders of pure bred livestock where unbroken and known lines of descent run back for a great many generations, sometimes for 50 years or more on a single farm under the ownership of a single human family. The discussion of the subject of selection will be found under that heading later.

(To be continued.)

KELLY HOLSTEIN SALE

The John J. Kelley Holstein sale on April 27 will offer to Holstein buyers opportunity to secure well bred Holsteins of quality. Included in the sale will be found a number of descendants of the wonderful dam, Mutual Ormsby De Kol 75458. This cow was born February 7, 1905, and at 24 months of age made an ARO record of 15.41 pounds butter in seven days. Fourteen years ago a 15 pound two year old was considered something out of the ordinary ,and if she had been handled as test cows are today she would undoubtedly have made 30 pounds or better. Mutual Ormsby De Kol was shipped to California with a number of other Holsteins to make the foundation of the Whittier state school herd. It was at Whittier she gave birth to the bull, De Kol Hartog Pontiac 123450, sired by a son of the King of the Pontiacs. This bull was placed at the head of the Rio Vista Holstein herd owned by Col. Ben A. Rhoades, where he sired a number of very choice individuals, some of which are included in this sale. De Kol Hartog Pontiac is also the sire of De Kol Hartog Pontiac 2d, who was out of the former state record two year old, Eva Riverside of Tuolumne, 25.11. This young bull was designed to be the junior herd sire of the Rio Vista herd on account of the wonderful producing ability of the dam whose record was made there. The daughters of these two sires are now widely scattered among the good herds of California and wherever given an opportunity have always made good.

Dispersal of Choice Holsteins

Norma Korndyke Cornucopia 38.41 lbs. butter from 673.1 lbs. milk in 7 days. She is a granddaughter of Pontiac Korndyke, and is the highest 7 days record cow ever sold at public sale in California.

Carruthers, Cal.

Wednesday, May 11, 1921

This dispersal is necessary in order to dissolve the partnership existing between H. E. Spires and J. M. Crawford, as the only means by which they can arrive at the actual value of the herd.

Neither partner will retire from the breeding of registered Holsteins, but they have made a positive agreement that neither one will bid on or buy a single animal in this sale, in order that there may be absolutely no question in the minds of other buyers as to the position of the owners.

THE VICTORY HERD is a choice collection of young cattle, including several really outstanding animals. The herd has been handled under average dairy conditions and in official test work has developed some splendid producers.

The sale contains the highest 7 day record cow ever sold at public auction in California, and a group of twenty-four granddaughters of the famous Hackney bull King Segis Pontiac Count, affording California buyers their first opportunity to buy so many females of this breeding at home. The list of females includes

NORMA KORNDYKE CORNUCOPIA, 38.41 lbs. butter from 673.1 lbs. milk in 7 days. She promises to make about 150 lbs. butter from 3000 lbs. milk in 30 days, milking as high as 114 lbs. in one day, and will be carried on test right up to sale day and sold open. She is a most attractive individual, with plenty of size, and is sired by a son of Pontiac Korndyke and out of a daughter of King Korndyke Cornucopia, whose 26 lb. dam made 722.07 lbs. butter from 17,245.4 lbs. milk in 278 days, and she is a daughter of the century sire Aaggie Cornucopia Johanna Lad. Last year, as a junior 4 year old, Norma Korndyke Cornucopia made 28.72 lbs. butter from 665.1 lbs. milk in 7 days.

A YEARLING DAUGHTER of Norma Korndyke Cornucopia, sired by Sir Piebe De Kol Segis Pontiac, son of King Segis Pontiac Count and a 717.46 lb. yearly record cow.

A HALF SISTER TO NORMA KORNDYKE CORNUCOPIA, by the same sire, out of a granddaughter of the century sire Changeling Butter Boy.

A HALF SISTER TO NORMA KORNDYKE CORNUCOPIA, by the same sire, out of a granddaughter of the century sire Sir Pietertje Hengerveld Segis.

TWO DAUGHTERS of the above cow, full sisters, sired by Sir Piebe De Kol Segis Pontiac, both with over 15 lbs. butter in 7 days as 2 year olds.

A DAUGHTER OF A 27 POUND COW that milked 637.1 lbs. in 7 days, heavy with calf to Sir Piebe De Kol Segis Pontiac.

A 27 POUND 3 YEAR OLD granddaughter of King Hengerveld 6th out of a granddaughter of Pontiac Korndyke, bred to Sir Piebe De Kol Segis Pontiac.

A DAUGHTER of the above 27 lb. 3 year old, by Sir Piebe De Kol Segis Pontiac, bred to King Pontiac Alcartra Prilly, 36 lb. son of the three times grand champion King Segis Alcartra Prilly.

A 26 POUND JUNIOR 4 YEAR OLD that milked 561 lbs. in 7 days. She is by a grandson of King of the Pontiac, out of a dam sired by a grandson of King Segis.

A 22 POUND 4 YEAR OLD, bred to Sir Piebe De Kol Segis Pontiac.

TWO DAUGHTERS of the above 22 lb. 4 year old, full sisters, sired by Sir Piebe De Kol Segis Pontiac.

A 19 POUND JUNIOR 3 YEAR OLD sired by a 31 lb. son of Segis Pontiac De Kol Burke.

A DAUGHTER OF MERCI LAD KORNDYKE BURKE, grand champion at 1920 California State Fair, out of an 18 lb. 3 year old daughter of Prince Gelsche Walker. Heavy with calf to Sir Piebe De Kol Segis Pontiac.

24 DAUGHTERS OF SIR PIEBE DE KOL SEGIS PONTIAC, therefore granddaughters of King Segis Pontiac Count, many of them bred to King Pontiac Alcartra Prilly.

BULLS IN THE SALE

SIR PIEBE DE KOL SEGIS PONTIAC, born Feb. 16, 1914. He is by King Segis Pontiac Count, the famous bull owned by Senator Hackney in Minnesota, and is out of a dam that made 717.46 lbs. butter from 17,635.2 lbs. milk in one year. He already has 10 A. R. O. daughters, splendid producers, and he is only a young bull yet.

KING PONTIAC ALCARTRA PRILLY, the junior herd sire, is by King Segis Alcartra Prilly, the Bridgford three times grand champion whose daughters are starting off with extraordinary production at first calving. His dam is Spring Farm Pauline Pontiac 2nd, 36.63 lbs. butter from 816.1 lbs. milk in 7 days, 982.32 lbs. butter from 26,262.2 lbs. milk in one year. She has three 7 day records averaging 31.49 lbs. butter and 703.3 lbs. milk. His seven nearest dams average 31.02 lbs. butter in 7 days, and five of them have yearly records up to 1127.35 lbs. butter.

A NUMBER OF YOUNG BULLS, some good enough to head breeding herds, others that will no doubt go at dairymen's prices.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

NOTE: This herd has been tuberculin tested regularly since its establishment five years ago. Only two animals have ever responded to the test, and one of these was an animal brought in by purchase subject to 60 day retest. Every female in the herd, of milking age, has dropped a normal living calf within the last year, and there has never been a case of abortion in the herd.

Catalog of sale free on request.

DISPERSAL SALE

55 High Class Registered Guernseys **55**

HOLLOW HILL FARM

Owned by G. W. Wilder

Colton, Cal., Thursday, April 28, 1921

A splendidly balanced offering, offering wide and choice selections of cows, bred and open heifers, and a remarkably strong list of bulls.

PRODUCTION

When we consider that under the adverse conditions for test cows necessary under the requirements of a certified dairy, females in this offering including junior 2 year olds, have made over 700, 600, 500, and 400 pounds butterfat it is at once apparent that large dairy production is present.

PEDIGREE

The female offering includes a number of fashionably bred imported cows, and their daughters by sires of equally rich and popular breeding. The pedigrees present a wealth of May Rose and Masher breeding, than which there is no blood in greater demand.

INDIVIDUALITY

Before you actually see these great animals in the sale ring, no further comment than a summary of the 1920 show ring winnings of the herd is necessary, including 40 firsts, 36 seconds, a number of lesser prizes, and several championships at the California State Fair, Los Angeles Live Stock Show, Riverside Fair, and Arizona State Fair.

GOOD HEALTH

In five years of regular tuberculin testing by a Deputy State Veterinarian to meet the requirements of a certified dairy, only one animal in this herd has responded to the test.

Only this remains to be said — IF YOU WANT TO SEE GREATEST PUBLIC SALE OFFERING OF THE GUERNSEY BREED YET MADE ON THE PACIFIC COAST, BE AT THIS SALE.

Every animal over six months old tuberculin tested and sold subject to retest by the buyer; every animal guaranteed to be a breeder according to terms in catalog.

Necessity of Raising Good Heifers

By C. V. Castle, Western Office Dairy Division

THERE are probably 25,000 cows on test in the western cow testing associations and probably 10,000 heifer calves dropped from these cows every year. To keep up this number of cows in milk probably 4,000 new cows must be added to the herds each year. This must be done either by purchasing cows or by raising some of these 10,000 heifer calves.

The average cow in the western associations produces more than 250 pounds of fat a year, while probably more than 10,000 cows average better than 300 pounds of fat a year. At the same time the average cow not in the testing associations averages considerably under 200 pounds of fat. Almost every man in an association has a goal of at least 300 pounds of fat set as an average for his herd, and there are a large number of herds that average better than 400 pounds and a few that will average close to 500 pounds of fat a year. Manifestly, then, no one should hope to keep up such an average and depend upon the market to replenish his herd, when it can be done by raising heifers from good cows and sired by the right kind of a bull. This is the only economical way to do it, yet there are a number of dairymen who are trying the other method. The wise dairymen, however, are raising their heifers, and in one grade herd in a western cow testing association 20 heifers which freshened in four years time had an average of 316.8 pounds of butterfat with first calf, one making 616.77 pounds and another 482.3 pounds. To have gone out on the market and bought cows that would average 316 pounds of fat with their first calf would have cost the dairyman from $75 to $100 a head more than it cost him to raise them.

It has been my observation from visiting many such herds and from studying their records that these heifers quite commonly equal the production of their dams with first calf and exceed them thereafter. It has also been my observation that heifers from similar cows, and in some cases from the same bull differ greatly in production when raised by different men and under different methods of feeding. It is because of this great difference in production, due to feed and care, especially with heifers with first calves, that I wish to state a few things that I think may help the ordinary dairyman to raise calves that will be better than their dams.

In the first place, because of the prevalence and wide spread of contagious abortion, and because of the effect of the abortion disease on the vitality of the calf and its resistance to diseases, such as scours and pneumonia, no man, no matter how healthy his herd may be at the present time, can afford to use slipshod methods in feeding and caring for his calves. Sooner or later this scourge may hit his herd and before he realizes it he may find that he has lost some valuable calves and that others are hopelessly stunted. That careful methods of feeding reduce the loss from this source has been proven again and again, and no dairyman can afford to take a chance and feed by guess, use dirty pails, and the many other bad practices that are commonly employed.

Another mistake that many dairymen make is to try to save a little money by putting the calf on skim milk when too young, and without supplementing it with grain; or to try and use so-called milk substitutes entirely when the calf is too young. Skillful feeders have been able to successfully put calves on skim milk at an early age, but from what I have seen of the practice, and from personal experience, I would say that it is an expensive method for most dairymen to follow. There is no satisfactory substitute for butterfat in the ration of the very young animal, and this applies to calves as well as to rats. Ordinarily a calf can be safely put on skim milk at a month to six weeks of age, six weeks to two months being better still, taking at least ten days to make the change. After the calf is three weeks of age it should be taught to eat grain so that the grain will at least partly take the place of the butterfat when it is removed from the ration. Skim milk feeding should be continued until the calf is from six to eight months of age, and a small amount of grain should be fed until the calf is ready to freshen unless the roughage or pasture is of the best. It is always well to feed a little grain until the calf is a year old.

For the man who has no skim milk I believe it is economical to feed fewer heifers but to continue some whole milk feeding until the calf is from three to four months of age, giving eight to ten pounds a day for the first two months and smaller amounts thereafter. The calf should be taught to eat grain when a few weeks old, and as the whole milk is gradually reduced, a calf meal, either home made or purchased, may be used to supplement it until the calf is six months of age, when grain may replace the calf meal.

A mistake that is commonly made is to let the calf eat hay when too young. The average calf is better off without any hay whatever until past three weeks of age. Alfalfa hay is more liable to cause indigestion in young calves than either grain or milk and should be the first thing to be removed from the ration if the calf shows signs of indigestion.

Another mistake that is commonly made is to put new born calves in a pen with older calves, thereby exposing them to scours and allowing them to eat hay before their stomachs are ready for it. Small calves are best cared for when shut up in individual pens or else tied so as not to be able to reach other calves until a month old.

One reason why young hand fed calves look unthrifty is that they are taken from the cow too soon and then fed milk from the herd which is unsuited to them. The calf does best when it is left with its mother for a few days and then fed on its mother's milk or on the milk of some other fresh cow for several weeks.

Another common mistake is to try and cure scours, especially the contagious kind, abruptly. This often results in chronic indigestion and a stunted calf. Contagious scours runs a course of several days and no strong medicine should be given to check it sooner than this. The best way to cure the calf is to remove all hay and grain and reduce the amount of milk. A tablespoon of blood meal or rennet placed in the calf's mouth several times a day is quite effective. A teaspoon of a solution of one part formalin in 30 parts of water, put in the milk at the rate of one teaspoon per pound of milk, can go along with the other treatment. In bad cases some of this formalin solution with a teaspoon of baking soda can be given in some warm water. Hot enemas, not above 110 degrees Fahrenheit, are also useful in case the calf gets weak and cold. Care must be used in getting the calf back on feed. There is no need of having a stunted calf, but at the same time there are hundreds of them in the country today and many calves die from the effect of scours.

Heifers properly fed and handled when young, either grade or pure bred, will make enough more butterfat with the first calf to more than pay for the cost of raising them compared with the cost the other way, and will be better cows ever after. Herds in cow testing associations have proved this and it is not uncommon to see two year old heifers as large as the average mature cows, and giving as much butterfat. On the other hand, a large majority of the heifers are undersized and unprofitable from a production standpoint with their first calf, and often always unprofitable. The loss on one or two unprofitable heifers will more than offset any saving that might have been effected by trying to feed the young calf cheaply.

The great need of the dairy industry is better bulls, but they cannot accomplish much without the proper feeding of the calves.

COW TESTING ASSOCIATION NEWS

According to E. H. Bahler of the Riverside association, they have some fine heifers: Carrie De Kol, Jr., two years old, made 70 pounds of fat in her second month. Segis De Kol Bess, Jr., three years old; makes 477 pounds of fat in a year. Bess Hartog Pietertje De Kol, as senior two year old, has given 430 pounds of fat in eight months.

L. H. Meads of Point Reyes Association, Marin County, who is already testing over 1,200 cows a month, says that interest in testing is picking up and that it will be necessary to start another unit in the association.

W. G. Maxfield of Kings association says that their year ends in March and it will be celebrated by a dairymen's banquet and awarding of prizes to the winners in the association. We hope that the association will reorganize for another year and keep Mr. Maxfield on the job.

D. W. Adams of the Imperial County association states that he is getting several dairymen to feeding balanced rations. Imperial Valley has such a fine climate that few dairymen have barns and but few have stanchions out in the open, but the latter is necessary if cows are to be fed properly and economically. Mr. Adams says that four out of five high cows this month could have been purchased six months ago for $160 each, but now twice that amount would not touch them.

C. B. Wiborg of the Petaluma association reports that 23 members are using milking machines. The machine has solved the labor trouble in the large herds and has not decreased production.

Henry Everett, assistant county agent of Sonoma County, states that six dairymen are intending to build silos. A few years ago the dairymen of this region did not believe the silo suitable for their conditions, but a few tried it and their success has convinced the doubters.

BETTER COWS—BIGGER PROFITS

In the reconstruction period through which we are now passing, the dairy cow is the best market for grains and roughage. And the better the cow the wider grows the margin of profit on the coarse feeds consumed. The safest and surest way to get better cows is to use pure bred sires of high productive pedigree. Proof of this is found in the degree to which Sultana's Virginia Lad has improved the production averages of the Jersey herd of the Missouri college of agriculture. When the college bought Sultana's Virginia Lad to head the Jersey herd this herd was somewhat run down due to the previous use of an inferior sire, says E. M. Harmon, extension assistant professor of dairy husbandry. Sultana's Virginia Lad was selected solely because he had sired high producing daughters in other herds. The wisdom of this selection is shown by the records the daughters of old Virginia Lad are now making.

The daughters of Virginia Lad in the college herd have an average milk production as two year olds 44 per cent greater than their dams at the same age, and their average production of butter fat is 60 per cent greater. The detailed figures show that these heifers averaged 7,722 pounds of milk and 445 pounds of butter fat a year, while their dams averaged 5,346 pounds of milk and 277 pounds of butter fat for the same duration of time at the same age.

In face of these facts how can a man who is milking cows afford to do without a high class bull to head his herd? It is evident that the 42 farm bureaus in Missouri now competing for the $2,000 prizes in the Missouri Better Bulls contest are going to gain many advantages in addition to the possibility of winning a prize. They are going to improve the best market now offered for their grain and roughage crops by improving the class of dairy cows to which these crops are fed.

Every man takes care that his neighbor shall not cheat him. But a day comes when he begins to take care that he does not cheat his neighbor.—Emerson.

B. H. RAWL RESIGNS

B. H. Rawl, assistant chief of the bureau of animal industry, United States department of agriculture, has resigned, effective April 30, to take charge of the educational work of the California Central Creameries. He will have headquarters in San Francisco.

Mr. Rawl is one of the most widely known dairy specialists in the world. A native of South Carolina, he is a graduate of Clemson College. He took special work in dairying at Pennsylvania state college and the University of Wisconsin. He has been with the department of agriculture for 16 years. He inaugurated educational work of the dairy division in the Southern states and later was placed in charge of all production work of the division. He was appointed chief of the dairy division in 1909 and assistant chief of the bureau of animal industry in 1918. He has been largely instrumental in bringing about the great advance of the past decade or so in scientific dairying.

BETTER THE CREAM BETTER THE BUTTER

The difference in price between high and low butter makes it imperative for cooperative creameries to produce a high scoring butter in order to make a success of their enterprise.

Good butter can never be made from poor cream. No matter how skillful the buttermaker may be, he can never expect to place high scoring butter on the market if he must churn cream which has been practically spoiled through careless handling.

It is not a difficult problem to keep cream clean and sweet. Cows should be clean and healthy and stabled in a well ventilated, well cared for barn. The milk should be drawn into clean, scalded, dry pails. The small top pails are the best. The strainer cloths should be thoroughly boiled and dried. Then it is important that the separator parts be clean, scalded and dried each day.

When cream handled with these precautions is placed in a clean, scalded, dry can and immediately cooled to 50 degrees Fahrenheit or lower and kept that cold until delivered to the creamery, it will give the buttermaker a raw material from which he can easily make the grade of butter that has brought Minnesota its enviable reputation.—Harold Macy, dairy division, University of Minnesota.

COMPARE PRICES FOR LIVE STEERS AND DRESSED BEEF

Despite the fact that the average price paid for good beef steers on the Chicago market from March 5 to March 19 declined from $9.95 to $9.70 per hundred pounds, figures compiled by the U. S. bureau of markets show that during the same period the average price of good steer beef at three large Eastern markets advanced from $16.47 to $17.63. Similar compilations show that from March 5 to March 19 the average price paid for medium beef steers dropped from $9.20 to $8.93, whereas during the same period the average wholesale price of medium steer beef increased from $15.43 to $16.65.

During the period covered the price of heavy steer hides declined about two cents per pound, which would justify either a decline of 13 cents per hundred pounds on live steers or an advance of approximately 25½ cents per hundred pounds on the dressed meat.

Even a schoolboy with a very short pencil can figure why one pure bred bull is cheaper than three scrubs. This has been shown in actual practice in one county where the dairy associations have found that the pure bred bull can be maintained at a cost of $5.34 a year to each member, while scrubs owned individually in the same county cost their owners $29 a year. In Pennsylvania, where bull associations have been longest established, 93 pure bred bulls are found sufficient for 5,604 cows, one bull for 60 cows. The total number of bulls in the entire country, including a vast number of scrubs, is so great that the ratio is one bull to every 19 cows. Just now when the farmer is obliged to accept every opportunity to economize, the foregoing figures suggest that this is a splendid time to replace three scrub bulls with one pure bred.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

April 26, Santa Anita Rancho, Santa Anita.
May 11, Victory Herd, Carruthers.
May 18-19, James McGillivray, Sacramento.

Shorthorns

May 26, Caledonia Farms, West Sacramento.

Announcement is made this week of the complete dispersal of the Finnell Stock Farm's herd of Herefords. This herd was established over a year ago at the time the owners purchased the Henderson Ranch near Galt, the original intention being to develop a high class herd. However, the owners have concluded to develop their ranch into an orchard and vineyard proposition and find that they will not have room to carry on their herd. The sale will be held at the ranch on May 26 and will consist of around 100 lots.

Taglio Brothers of Gustine have purchased from the Carnation Stock Farms, Seattle, Washington, the young Holstein bull, Carnation King Tillie. This bull is declared to be a splendid son of Carnation King Sylvia and a very fine daughter of Matador Segis Walker.

The Bridgford Holstein Company of Patterson, who consigned the heifer, Prilly Adirondac Dairy Maid, that sold for $4,500 in the Brentwood sale at Philadelphia last month, purchased in the same sale the two year old heifer, Fairmont Colantha Prilly. It is of interest to note that this heifer was sired by King Segis Pontiac Alcartra, sire of King Segis Alcartra Prilly, the Bridgford herd bull, and her dam is the highest record daughter of Prilly Princess Julia De Kol, dam of King Segis Alcartra Prilly. She was purchased carrying the service of Sir Aaggie Mead De Kol.

The Thos. Dibblee Estate of Santa Barbara has purchased from M. L. Andrews of Iowa the Shorthorn bull, Imp. Cluny Royal Windsor. This bull was bred by Lady Cathcart and is a son of President of the Mint and out of a dam by Edgar of Cluny 2d. Imp. Cluny Royal Windsor is a rich red six year old bull and comes to this state with a splendid reputation established as a sire.

R. M. Dunlap of Sacramento, one of the best known cattlemen of this state, is now in charge of the Bar N herd of Herefords owned by E. N. Noyes & Son of Sutter. This herd has been materially strengthened the last few months and under the experienced management of Mr. Dunlap it is expected that the Bar N Herefords will prove influential factors in Hereford affairs in the West.

Andy Simpson, who is in charge of the Caledonia herd of Shorthorns, reports sale of a yearling son of Gainford Matchless, grand champion at the 1919 San Francisco show, to F. S. Trossi of Reno, Nevada. Mr. Trossi expects to place his new purchase at the head of his herd.

W. J. Higdon of Tulare has purchased from Alex. Whaley of Tulare the Holstein bull, Sir Aaggie De Kol Acme 2d, and it is his intention to use this bull on the daughters of King Korndyke Pontiac 20th. Ever since the Higdon sale of last year, at which he disposed of the older members of his herd, together with King Korndyke Pontiac 20th, that was sold to the Burr Farm of Los Angeles for $12,000, Holstein breeders have been anxiously watching to see what bull Mr. Higdon would secure to carry forward his well defined plans, and it is generally agreed that he has made a ten-strike by buying the Whaley bull. Sir Aaggie De Kol Acme 2d was sired by Sir Aaggie De Kol Acme and his dam is Aralia De Kol 3d, the 1,100 daughter of Aralia De Kol, whose record of 1,142.32 pounds butter in a year as an 11 year old cow was a world's record when made. Five of the seven nearest dams of Sir Aaggie De Kol Acme 2d have an average yearly butter production of 1,154 pounds and an average production for two years of 2,089.65 pounds butter. The career of this bull in the Higdon herd will be watched with great interest.

Homer L. Graham, manager of the Eastman Poland China Ranch, San Fernando, has purchased the boar, Sky Pilot, from the Harriman herd of Missouri. Sky Pilot is declared to be one of the best sons of the noted Liberator.

Geo. V. Beckman & Sons, Lodi, have a Poland China boar bearing the name, "The Cultivator." The Cultivator is a son of Liberty Bond.

Primrose of Courtil Du Ray has established a new record of butterfat production for cows on the Island of Guernsey, by producing in one year, at six years of age 14,420.5 pounds of milk and 899.48 pounds of butterfat. This production exceeds the record of the previous champion by more than 116 pounds.

J. W. Snodgrass, manager of the Berlywood Stock Farm, Hueneme, reports the following records recently completed in their Holstein herd: Sadie Vale Veeman Karlray, a junior three year old, 30.16 pounds of butter from 539.2 pounds of milk; Miss Bracelet Fobes Korndyke, 25.24 pounds of butter from 726.2 pounds of milk in seven days and 104.21 pounds of butter from 3,042.2 pounds of milk in 30 days as a junior three year old; Romeanna Douwe, 27.05 pounds of butter from 637 pounds of milk in seven days as an eight year old; Douwe Pontiac, 27.12 pounds of butter from 522.1 pounds of milk as a senior three year old. Fay Tritomia Hengerveld Walker, 27.12 pounds in seven days and 109.25 pounds in 30 days. Mr. Snodgrass is just out from the hospital and his many friends will be glad to know that he will soon be "hitting on all six."

Bassett Bros., Hanford, recently received a September boar pig from W. J. Graham, Howard Lake, Wisconsin. This young boar is sired by Buster's Liberator, one of the best known Poland China boars in the Cornbelt. He is unusually large for his age and has class and quality enough to make a very strong show in the senior boar class at the state fair next fall.

A. Buckland & Son, Fresno, have a fine litter of pigs sired by the famous boar, King Kole, owned by Ed Petty, Versailles, Missouri, that will look good in the Poland China futurity next fall if they continue to grow as they are doing at present. Buckland & Son expect to make their usual good showing at the fairs this year.

E. J. Wilson of Ripon has a junior two year old grade Jersey heifer that has just finished her year's test with 9,163.9 pounds of milk to her credit and 527.59 pounds of butterfat. The heifer's ration consisted of alfalfa hay together with four pounds of concentrates per day which was made up of three parts barley and one part coconut meal. She also carried a calf 207 days during the test. In commenting on the heifer Mr. Wilson says: "This heifer was so small at birth that I didn't think it best to try to raise her, but my wife insisted upon it, so she took charge and named her Teeny. The heifer did so well that at the time of calving she weighed about 900 pounds. Her dam was just a fairly good cow with 420 pounds of fat to her credit with the third calf. Her sire was a registered bull whose granddam was a sister to Viola La France, world's champion four year record cow of all breeds."

Rubber Boots
For Ranchers Irrigation and Work

$3.98

A wonderful value in Hip or Knee Length Rubber Boots made of REAL gum Rubber with heavily reinforced seams. Made to order of the English Government for the British Army at actual COST OF MORE THAN WE ARE SELLING THEM FOR. Will stand all extremes of heat and cold and made to give extra long wear. Finest quality pure gum rubber with extra heavy soles. This is one of the very finest BARGAINS we have ever been able to offer our customers and the stock is limited so get your order in very early. Nothing better can be worn by ranchers or men who work in irrigated districts, rice fields, etc. This quality of Hip rubber boot would usually cost you $7.50 to $8.00. Remember you can get the full HIP boots for $3.98 or the shorter knee length boots for $3.29. Be sure to mark which kind you want on the coupon below. WE DO NOT WANT YOUR MONEY IN ADVANCE. We take all risk because these boots are such wonderful values. Fill out coupon NOW and mail at once if you want some of these boots before they are sold out.

EMIL OLCOVICH SHOE CO., DEPT. 43

Guerin Holsteins Average $387

The R. F. Guerin dispersal sale of Holsteins drew a representative crowd of breeders to Visalia, April 14, and 52 head of cataloged animals, excluding a few females that were sold as reactors, were appraised at the satisfactory average of $387. The feature of the sale was the yearling son of King Korndyke Pontiac 20th and K. P. Tola. This youngster, boasting a very strong and in every way attractive pedigree, made many friends because of his splendid individuality. He was purchased by Alex. Whaley of Tulare for $3,000. Frank Helm of Fresno was the runner-up. The top female, Visalia Canary Pet, a 23.72 pound daughter of Homestead Canary Pride and Black Patti, went to Walter Mitchell of Visalia for $850.

Burr Farm of Los Angeles took ten head of cows and heifers for their herd and E. Burr added seven head of young things to the shipment he is making to his Canadian ranch. T. H. Brice of Los Angeles took in six head.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento, and Col. Ben A. Rhoades of Los Angeles was on the block. Col. Bell of Tulare assisted in the ring.

A list of representative sales follow:

BULLS

1, King Sadie Vale Idyl Segis, July, 1917; Mrs. C. H. Sears, Bakersefild, $400.
2, King Tola Korndyke Pontiac, April, 1920; Alex. Whaley, Tulare, $3,000.

FEMALES

3, S. V. K. P. Fidessa of Sunnyside, 21.85 lbs., Sept., 1917; T. H. Brice, Los Angeles, $575.
4, Queen Fidessa of Sunnyside, March, 1920; A. B. Spooner, Jr., San Luis Obispo, $300.
5, S. V. K. P. Aaggie of Sunnyside, 21.92 lbs., Sept., 1917; T. H. Brice, $775.
6, Sunnyside K. S. V. Aaggie, March, 1920; Burr Farm, Los Angeles, $300.
7, S. V. K. P. Japonette of Sunnyside, 16.92 lbs., Sept., 1917; Mrs. C. H. Sears, $700.
8, K. S. V. Japonette of Sunnyside, October, 1920; E. Burr, Los Angeles, $190.
9, Empress Alcartra Karlray, July, 1917; T. H. Brice, $300.
10, K. S. V. Empress of Sunnyside, July, 1920; W. F. Mitchell, Visalia, $245.
12, Queen Abbekerk of Sunnyside, April, 1920; Burr Farm, $200.
13, Allenvail Segis of Sunnyside, May, 1920; Burr Farm, $375.
15, Grace Segis Jannek, March, 1920; Frank Helm, Fresno, $250.
16, Sunnyside K. S. V. Grace Segis, Sept., 1917; W. F. Mitchell, $260.

57, S. V. K. P. Volta of Sunnyside, 13.25 lbs., March, 1917; Los Angeles County Farm, $410.
61, K. S. V. Calvia of Sunnyside, October, 1920; A. B. Spooner, Jr., $190.

HARTSOOK AND MORRIS CLOSE ANOTHER SENSATIONAL BULL DEAL

Another sensational Holstein transaction was recently completed when Fred Hartsook of Lankershim purchased from A. W. Morris & Sons, Inc., Woodland, a half interest in the well known bull, Sir Aaggie De Kol Mead, at a price that sets a new record for a half interest in any bull on the Pacific Coast. Sir Aaggie De Kol Mead is a three year old son of Sir Aaggie De Kol Acme and out of the great dam, Miss Valley Mead De Kol Walker, who broke three world records as a heifer, won the California dairy cow competition over all ages and breeds, and made 36.81 pounds butter in seven days and 1,113.58 pounds in 342 days as a junior three year old. She is by Prince Gelsche Walker and out of De Kol of Valley Mead 2d.

It will be recalled that several months ago Mr. Hartsook purchased from the Morris firm a half interest in the young bull, Prince Aaggie Mead, a son of King Aaggie Mead and Miss Valley Mead De Kol Walker. Under the terms of that sale the bull was to spend half of each season with Mr. Hartsook's herd. Similar terms govern the latest transaction, and it will therefore be possible for Mr. Hartsook to maintain a son of Miss Valley Mead De Kol Walker in his herd at all times.

Few men who have entered the Holstein business in this state have displayed greater foresight in their operations than Mr. Hartsook, and by this recent sensational deal he has placed himself in a very strong and strategic position.

In addition to the above facts it is of interest to know that Sir Aaggie De Kol Mead is the sire of the two heifers Mr. Hartsook secured from W. J. Higdon of Tulare and Brentwood Farms of Pennsylvania.

ESCALON PRINCESS

California has a new champion in class CC of the Guernsey Advanced Register. The new State Class Leader is Escalon Princess, owned and bred by A. B. Humphrey, Escalon. The cow also ranks ninth among all class CC Guernsey cows. Escalon Princess 62332 is a daughter of Don Adonis of Linda Vista, Mr. Humphrey's herd sire, and she is the second of his daughters to qualify for the Advanced Register. Don Adonis of Linda Vista 20616 is a son of Jethro's May King of Linda Vista. The dam of the new California class leader is Linda's Princess of Maple Lane, also owned by Mr. Humphrey. She has an Advanced Register record of 439.27 pounds of butter fat in class A.

Escalon Princess dropped a bull calf on November 8, 1919, sired by Bullion of Edgemoor, a son of Imp. Itchen May King. She was bred again on February 15, 1920, to Nobleman of Maple Hill 54086, and carried a calf 270 days of her testing period. She was milked with the main herd until April 1, 1920. Her milkers were changed about once every month. On April 1 she and the other test cows were moved to a new test barn, and were milked by W. T. Brooks. The cows were never in the barn over night and were in pasture every day except during the months when there was nothing growing.

COOPERATE IN GOPHER CONTROL

We cooperate in production, in marketing, in religious, social and educational affairs, and sometimes in control of the pests which make life a burden, but in one particular, seldom, and that is gopher control, though there have been occasional "drives" directed by horticultural commissioners, and these have doubtless resulted in saving tens of thousands.

One trouble with the gopher is that his subterranean work isn't constantly before us, and until we see a valuable tree, the product of years of care, totally destroyed we are too much inclined to ignore the work of this tiny underground pest. With some orchardists it is easy to excuse neglect in this matter because "Our neighbors supply will come over and stock our land again even if we do trap." Therein we should have closer cooperation. But, admitting that the neighbor will not look after his own interests to the extent of ridding his land at his own expense, the rest of us should not suffer the loss consequent.

A string of good traps is a most satisfactory method of control. Trapping has the advantage of certainty. If we fail to make a catch we are certain the gopher is still on the job, hence, we renew the fight and soon have him. If the grower is unable to give personal attention to it we have known of perfectly satisfactory agreements made with neighbors' boys by which a 10, 25 or even 50 cent bounty for each scalp secured has been paid. Fifty cents is doubtless too high but a satisfactory basis of work may often be arranged which gives the boy good wages, gives the alfalfa grower release from the everlasting toll levied by the gophers, and gives the orchardist relief besides.

Trap the pests.

40---Head of Pure Bred Holsteins---40
30--Head of Highclass Grade Holsteins--30

Buyers of well bred Holsteins will find in this herd of well bred cattle that not only are fashionably bred but combine a world of type, conformation and persistent producing ability. Among the offerings will be found a 22.99 lb. daughter of ARCADY PONTIAC WAYNE HENGERVELD; a 19.95 lb. daughter of PRINCE ARALIA WALKER whose dam produced 1,100.48 lbs. of butter in 365 days. she being out of the former World's Champion Aralia De Kol. A 16.83 lb. daughter of FOBES TRITOMIA MUTUAL DE KOL who was the sire of Lady Oak Fobes De Kol. 36.44; a 16.68 lb. double granddaughter of LAD LEGENT OF KAKENSTEIN; a 2 year old daughter of IT. a 37 lb. sire and out of a 27.24 lb. 3 year old daughter of the Century sire CHANGELING BUTTER BOY; a daughter of a 27.07 lb. cow; a daughter of KING PONTIAC NETHERLAND SEGIS out of a 23.73 lb. 3 year old; 3 daughters of King Korndyke Sadie Vale 27th; 2 daughters of DE KOL HARTOG PONTIAC, a grandson of the King of the Pontiacs and 4 daughters of DE KOL HARTOG PONTIAC 2d whose dam, Eva Riverside of Tuolumne, produced 25.11 lbs. of butter from 454 lbs. of milk as a 2 year old. Also a number of young heifers from the above cows sired by the herd sire (to be sold) ANSELMO CRANE IT, a son of the good sire IT and out of a 19.98 lb. daughter of ANSELMO.

The grade Holsteins are considered one of the best producing herds in Southern California. Buyers looking for tops will not be disappointed in them.

Prospective buyers are cordially invited to drive out to the farm and inspect this splendid offering.

Dodder is Serious Pest

IF REMEDIES to exterminate dodder, the parasitic plant infesting clover, alfalfa and some other plants, are applied before it gets a foothold, the pest does not cause serious damage. If, however, dodder is permitted to develop unmolested, radical measures will be necessary in order to control it.

Starts in Small Patches

During the first season of infestation in alfalfa, dodder usually occurs in small scattered areas. As is the case in combating all weeds, it is essential that dodder should not be permitted to mature seed, and such small infested areas should be mowed and the dodder removed or burned in the field to prevent the development of seed. If seed has formed, burning the patches of dodder is the only remedy, since it kills not only the plants but also any seeds which may be lying on the surface of the soil.

Easier to Prevent than Eradicate

If infestation is so great that patch treatment cannot be depended upon it will be necessary in order to free the farm of the pest either to plow the crop under or utilize it for hay before seed has formed. In the latter case the aftermath left on the field should be closely grazed, for which purpose sheep are especially useful. If the infestation is general and threatens seriously to damage succeeding crops, it may be necessary, according to the bulletin, to cut the crop, to allow it to dry, and burn it in the field in order that all dodder seed may be destroyed.

Inferior Seed Blamed

As with all weeds preventing introduction on the farm is far easier than eradication after it has once gained a foothold. It is usually introduced by the use of impure seed, and farmers should learn to distinguish dodder seed so that they can recognize it when they are purchasing clover and alfalfa seed. For adequate examination a magnifying glass is necessary. There is a wide range in size of dodder seed, but in general they are usually dull coated with roughened or minutely pitted surfaces, and usually have two or three flat surfaces, while the seeds of clover are usually smooth, rounded, and possess a certain luster. Furthermore, the scar on dodder seed usually is very inconspicuous, whereas the scar on leguminous seeds is clearly evident. Their color ranges from dark brown to green or yellow. While it is possible to remove a large percentage of dodder by carefully cleaning impure clover and alfalfa by screening, it is practically impossible to remove large-seeded dodder by this process.

When animals are allowed to graze where dodder grows, they should not have access to fields not infested, since they are likely to spread the weed by means of pieces of stems adhering to their coats and hoofs. On land which contains the seeds of dodder the bulletin suggests the use of a five-year cropping system consisting of plants which are not damaged by the pest, and recommends the following plants: Corn, soy beans, velvet beans, cow peas, and small grains such as oats, wheat and rye. Sugar beets, onions, flax and a few other cultivated plants are subject to dodder infestation, but clover and alfalfa are its important hosts.

The Orchard and the Small Dairy

By E. L. Koethen

YEARS ago when Dr. A. J. Cook was conducting institutes he advocated the maintenance of small dairies in connection with the citrus orchard—that it would be a good thing if each orchardist should have a tract of land in connection with his citrus property that should yield enough feed to maintain a small dairy, the manure byproduct to feed the orchard. Since that time all kinds of fertilizing materials have doubled, and more than doubled. Stable manure that at that time sold for $3.50 per hundred feet, delivered on the ranch, now costs $8 to $10 per hundred, and so with other materials. In addition to this, the supply has at times been so short that it has been inadequate to meet the demand. Doubtless this has led the editor of the Cultivator to feature this problem in his paper.

Dr. Cook was right; the observation of the writer has proven it to his own satisfaction. We have in mind a family which began with a cheap young heifer, half starved, and not a big investment. It was just to try how it would be to have "your own supply of Jersey cream," enough for two to revel in. It was just for the fun of it, though the wife had often said she would never be burdened with the care of the milk of even one cow and be tied down to be the servant of a cow. By the time the cow had a second calf the little heifer had grown to be a first class grade Jersey cow. She was giving enough milk to supply several families, and they were swamped with milk. They had their own butter made in an ice cream freezer, and it was the best they had ever had; they had whipped cream, real cream whenever they wanted it, ice cream all through the summer as much as they could eat. For the first time in their married life, the wife succeeded in attaining her highest ambition, the husband added flesh to his lean frame and looked wholesome. The health of both was improved and the cow was declared a success; but the question was what to do with the surplus as they did not wish to make butter to sell.

At last they hit upon a plan that worked out finely. They had a neighbor boy who was willing to make a little pocket money. They engaged him for a compensation of so much per quart to carry the milk to neighbors who were anxious to get such good milk. It was sold whole. No separator was used to extract a portion of the cream before delivery. The boy returned the bottles and collected the bills at the end of the month. In this way the cow was made to pay for her feed, supply the family with a staple article of food in unheard of quantities, and the manure was feeding the orange orchard, leaving a profit besides. They remembered that Dr. Cook had said the cow was a delicate machine, even more sensitive than a mere machine, because she resented it if the keeper was cross to her, but like a machine in that the more gas she could consume, the greater the speed. So they coaxed her to eat all the good feed she could hold, giving it at short intervals, and petting her frequently. The result was more milk.

When a heifer calf arrived she was reared with the greatest care and common sense. So after about two years another cow had been added, and the family estimated that the additional manure had about paid for a valuable cow. Well, to make the long story short, they now have three cows that are fed chiefly from products raised on a portion of the ranch not planted to oranges. There are about four acres of alfalfa and several acres devoted to corn and garden products. No trash of any kind that could rot is burned. It is all used first as bedding and then buried in the orchard as manure. Some straw is also purchased to increase the bulk of organic matter. This is used freely as bedding, and no chance to increase the amount of organic matter is neglected. They sell enough alfalfa hay to pay for all other supplies bought, so that the only cost of maintenance that can be charged to the cow's account is the labor bill. They collect over $100 per month from the sale of the milk, besides what the family uses. This is profit to the family, as the labor is furnished by them, and done chiefly on what would otherwise be spare time. With three cows, a heifer and one horse, they cover the orange

orchard of five acres each year with a good coat of manure. This is showing results in increased crops, as it is of better quality than the ordinary manure found on the market. It goes under ground almost as fast as it is made, and thus very little of the volatile part is lost. In addition to this the orchard is given a good dressing of tankage each season. Two cover crops a year are grown so that the humus content of the orchard is being built up with gratifying results.

To sum up the results of this practical experiment, it may be said that there is profit in keeping cows in connection with orange culture.

The cows can be managed so as to produce a profit to the owner.

In order to do this, additional land is needed to produce the necessary feed.

It is a practical source of best quality manure.

It is some trouble to the grower, and requires some work, and ties the grower down to steady work. The cows must be tended to regularly and with system.

More oranges and better oranges can be produced in this way, at reduced cost.

The young animals seem to grow up at so small a cost that it is not felt. They eat less of the more valuable feed, as they can be pastured along the edges. This is a source of profit to one who does not have to pay for the labor or care of the animals.

The family is supplied with better milk than that usually found on the market.

Alfalfa hay is worth about as much after it is converted into manure as it was originally. There is little loss in feeding it.

A large grower at Riverside has purchased hundreds of tons of alfalfa this season at a cost of over $25 per ton to spread on the orchard for fertilizing purposes. If this can be profitable, the small grower can certainly make it profitable to feed it to cows before using it as fertilizer.

If the small grower is fond of animals and can learn to love and pet them and is willing to be tied down to chores, it will be profitable for him to keep one or more cows.

MACHINE VS. HAND MILKING

Milking is one of the largest items of labor in connection with milk production, and a study of the two methods of milking is of interest as well as practical significance. Since considerable extra time and labor is involved where milking machines are used, in washing and caring for the machines themselves, it is obvious that these items should be included in order that a fair comparison might be made.

The dairy husbandry section of the Michigan experiment station, in the course of extensive studies in the cost of milk production, has secured some interesting data along this line. Accurate figures were kept throughout the entire year with 93 herds in condensery districts within the state, 42 of these herds being hand milked and 51 machine milked.

Comparisons of Machine and Hand Milking

The tests show that the average time spent in milking and caring for the milk and utensils in the 42 herds milked by hand was 100.44 hours per cow per year, as compared to 71.28 hours, the average time in 51 machine milked herds. The figures show that the extra time required to wash and care for the machines is made up many times in the greater speed of milking with machines. A saving of 29.16 hours per cow per year is shown in favor of the machine method of milking, which would amount to 525 hours labor per year with a herd of 18 cows, the average size of the 51 machine milked herds in which these investigations were carried on.

Compared on the basis of 100 pounds of milk, the tests show that 1.42 hours labor were required on the average in milking and caring for 100 pounds milk and washing the utensils in the 42 herds where hand milking was practiced, while 1.12 hours labor were required in the 51 herds where the machine method was employed. This shows a difference of three-tenths of an hour, or 18 minutes, in favor of the machine for each 100 pounds of milk. Less difference would probably be found where market milk was being produced, as the higher requirements specified for milk used for such purposes would necessitate greater attention to the care and cleaning of the milling machines.

MORE HOGS

Increase of 27 per cent in the number of hogs in California during the last decade is noted in a recent report from the college of agriculture. In 1910 there were 767,000 head of hogs while in 1920 the number was 973,000. Relative rank of the swine breeds in the country as a whole is given as follows:

Duroc-Jersey, 34.2 per cent; Poland China, 27.9; Chester White, 10.7; Berkshire, 9.2; Razorback, 4.2; Hampshire, 3.9; Tamworth, 0.7; Yorkshire, 0.6; Cheshire, 0.3; others, 2.7; nondescript, 5.6.

"Since pork constitutes more than one-half of all the meat produced in the United States and is the mainstay of the ration of most laboring men and soldiers, the importance of pork production becomes evident," the report declares.

Ten years ago the price of hogs was a little over $9 a hundred. In 1919 it was $22 a hundred, in 1920 it had fallen to $19 a hundred. The cost of corn and barley, however, have similarly fallen since 1919.

"In this state the work of the farm bureaus and of the University of California has had much to do with stimulating swine production by means of pig clubs and community auction markets," the report says. "These agencies have brought about considerable improvement in quality and prices, and doubtless have been one of the main factors in the great increase in the number of hogs."

Through the division of agricultural education the university is now offering a corresponding course on swine husbandry.

California Cultivator,
Los Angeles, Cal.

Gentlemen:

I wish to call your attention to the fact that the farm paper published by Mr. Scott of San Francisco and entitled The Farm Bureau Bulletin of the Sacramento Valley, has no connection with the Farm Bureau Federation, nor is it the official publicatiion.

We have no fight with Mr. Scott or his paper and send out this letter only because he is using the name Farm Bureau Bulletin, which had led many to believe that it is the official paper of the Farm Bureaus.

Yours truly,
FRED J. HART,
Chairman of Publicity Department, California Farm Bureau Federation.

TO KEEP BUTTER AND MILK COLD

Pack a large stone jar of three, four or five gallon capacity in a box of wet sand, having the sand five or six inches thick under and around the sides of the jar. Place a tight cover over the jar and box and set in the shade. Milk and butter that is placed in this jar will keep in excellent shape for some time. Keep the sand thoroughly wet, as this is the important factor.

A new test barn of the most approved type, capable of accommodating 24 cows, has just been finished on the Hartsook Ranch at Lankershim. In celebration of this event Manager Earl J. Sturgis has just broken the state record for senior yearlings with Rosamaines Dora Jeeke, who made 23.11 pounds of butter from 376.1 pounds of milk in seven days. This heifer is by King Segis Pontiac Netherland 3rd and is out of the 29 pound cow Dora Netherland Segis. She is a full sister to Dora Pontiac Segis, who made 37.04 as a senior four year old but died from the effects of a wire in her stomach shortly afterward. Mr. Sturgis has also recently finished Colantha Pauline Korndyke with 28.88 pounds of butter in seven days as a junior three year old, and Athenia Roderick Lencke, who made 36.61 pounds from 604.2 pounds milk as a junior four.

A Big Opportunity

to buy registered Holsteins that are bred in the lines of the breed's greatest milk production: young cows bred to bulls with tremendous milk and butter production back of them; the largest number of fresh cows and heavy springers that have ever appeared in a western Holstein sale; just the sort of females that are ready to make profit for the buyer the minute he gets them home.

Willowmead Herd, Sacramento, Cal.

Owned by James McGillivray

177 REGISTERED HOLSTEINS 177

167 Females—10 Bulls

Wednesday and Thursday May 18-19, 1921

28 DAUGHTERS OF DUTCHLAND SIR KORNDYKE COLANTHA
who is by a full brother to the great foundation cow Pontiac Clothilde De Kol 2nd, the first cow to make over 37 lbs. butter in 7 days and over 1260 lbs. in one year. His dam is a 24 lb. daughter of Colantha Johanna Lad that milked 657.2 lbs. in 7 days and made 750.48 lbs. butter from 22,645.6 lbs. milk in one year.

18 DAUGHTERS OF KING PONTIAC RUBY BURKE
who is by King of the Pontiacs, the only double century sire, and out of a 25 lb. half sister to the former world's record milk cow Riverside Sadie De Kol Burke. He already has seven yearly record daughters with records up to over 850 lbs. butter for a 3 year old.

17 DAUGHTERS OF PRINCE BUTTER BOY WALKER
who is by Prince Gelsche Walker out of a dam that made 828.62 lbs. butter from 19,543.2 lbs. milk in one year, she by the same sire as the 1008 lb. yearly record cow Miss Blaney.

14 DAUGHTERS OF KORNDYKE COLANTHA PARTHENEA
who is by Dutchland Sir Korndyke Colantha (see above) and out of the great breeding and producing cow Minnewawa Louise, who has seven A. R. O. daughters with records up to over 32 lbs. butter in 7 days.

10 DAUGHTERS OF KING MEAD OF RIVERSIDE
the famous sire of yearly record producers, including the world's strictly official yearly record cow Aaggie Acme of Riverside 2nd. A number of these have large yearly records as well as 7 day records.

8 DAUGHTERS OF YOLO VALDESSA HENGERVELD
Who is by the 41 lb. bull King Valdessa and out of a 30 lb. dam.

The sale also includes daughters of such sires as King Korndyke Pontiac, King Pontiac Topsy, Colantha Sir Pontiac Aaggie, and King Segis De Kol Mead.

COWS AND HEIFERS WITH RECORDS UP TO OVER 32 POUNDS BUTTER IN 7 DAYS.

A CONSIDERABLE NUMBER OF COWS AND HEIFERS WITH YEARLY RECORDS.

DAUGHTERS OF COWS WITH RECORDS UP TO OVER 32 POUNDS BUTTER IN 7 DAYS AND UP TO OVER 1000 POUNDS BUTTER IN ONE YEAR.

WILLOWMEAD HERD contains over 500 head of registered Holsteins at the present time. This sale includes every cow in the herd that is in salable condition. The oldest cows and some with defective udders are kept to furnish milk for the large number of young calves in the herd.

OF THE 167 FEMALES in the sale 93 are 2, 3 and 4 year old heifers; 49 more are 5 and 6 year old cows. There are 85 fresh cows in the sale, many others milking heavy right now, also a large number of heavy springers.

MORE THAN HALF OF THE FEMALES are bred either to COLONY ZARILDA NEWMAN, son of the great 33,000 lb. Canadian cow Zarilda Clothilde 3d De Kol, or to PRINCE ECHO SYLVIA SEGIS, who is sired by a son of the great producer May Echo Sylvia.

Every animal positively guaranteed to be a breeder; no tuberculin test certificates.

An abundance of flowers will transrm any old house into an admirable l home.

Spray machinery should be in workg order and spray material on hand.

IDLE LANDS INCREASE

TIMBER depletion has now reached a point in this country where three-fifths of the primeval forests are gone and 61 per cent of the timber left is west of the Great Plains, Col. W. B. Greeley, chief forester of the United States forest service, recently told the members of the Chicago Association of Commerce.

Liberal use of American forests was a necessary part of the commercial growth of this nation, but reforestation should have been practiced, if not from the start, at least in late years. There is an abundant area of forest land in this country to support all industries, and a liberal supply of wood is most necessary to the people of this country. It is thought that, like the European countries, we would use, when our civilization was older, but one-third or one-half as much wood per capita as we did in the early days. But this rule does not affect the American people. The older the states and communities in this country grow the more timber they seem to require in one form or another.

Many substitutes have been devised for wood and yet the great demand of the country for timber continues to grow. More wood is used in construction today than before the discovery of concrete, and more wood is used in building railway cars than before the steel or part steel car was developed. This is apparently true in nearly every industry.

Abundant and widely distributed forests have meant to the United States homes for the masses of the people beyond the standards of any other nation. They have placed newspapers and magazines on the average family table. They have contributed largely to social and industrial conditions which promote democracy and constructive energy rather than discontent and destructive social forces bred by hard and comfortless conditions of life.

The idleness of 81,000,000 acres of forest land, an area increased by 8,000,000 to 10,000,000 acres annually, destructive logging and still more destructive forest fires, are the factors at work to increase the timber shortage.

The exhaustion of American timber has not come about because the forests have been used so freely, but because of the failure to use forest growing land. The United States is cutting wood out of its forests three or four times as fast as it is being grown. Much of the land on which timber stands or has been cut off will always be forest land. It is ample to grow all the wood needed for the use of the people of this country and for export trade in lumber and products manufactured from lumber, if the land can be kept at work growing trees. Timber for the future is simply a matter of putting idle land to work.

CHEMISTRY NUMBER

The monthly bulletin of the department of agriculture of California for January is pretty nearly chemically pure. It has a foreword by Director Hecke in which he refers to former methods of chemical analyses and various tesets in which three separate laboratories were maintained in California. Now they are all together under one division of the department of agriculture known as the division of chemistry. This division is only about one year old but under the direction of Prof. George P. Gray is becoming a most efficient and valuable department of state work. Prof. Gray gives an introductory chapter describing the work of the division, refers to its having made analyses for consumers of fertilizers, dairy products, insecticides and fungicides, and also to its activity in making investigations. Several illustrations give an idea of the laboratories. One chapter has to do with "Reduced Acidity in Oranges Caused by Certain' Sprays." It is written by Geo. P. Gray and H. J. Ryan, the latter horticultural commissioner of Los Angeles County. The principal feature of this chapter is the large number of tables showing acid content of oranges both sprayed and unsprayed. Other topics touched upon in this bulletin are: "Soil Ingredients Withdrawn by Fruit," by George E. Colby; "Value of Gas Tight Covers in Fumigation," by R. S. Woglum; "Dry-Bog Soils," Gordon Surr and Roland Vaile; "The Composition of Sheep Manures," George E. Colby.

VOLUNTEER COTTON

By M. E. Bemis

Growing cotton from the stumps of last year's stalks looks interesting to the grower who has most of his ready cash tied up in the cotton which is being held for better prices.

This is not a new game, as cotton farmers have tried it ever since the second season of cotton growing. As a general practice that can be followed year in and year out, like growing sugar cane, there is nothing much to be said.

Like growing millet, or riding a mule, it is more or less of a makeshift, something like the substitute that the grocer hands out when your special brand of tea or chewing tobacco hasn't come in yet.

This season the determining factor is the cost of planting a crop, and the poorer quality of lint and less quantity is a matter than is not so vital as it was when cotton looked like a dollar a pound.

Dr. O. F. Cook, the noted Long Staple cotton expert, commenting on this matter, says:

"One precaution may be noted for the early spring, to avoid watering the fields before the shoots have started. The indication of past experience is that more plants survive and send up shoots in dry, open soil than on heavy or wet land. Even the cutting of the stalks too soon in the fall or winter seems to reduce the chance of survival, perhaps through increased exposure of the wood to infestation by fungi while the tissues are dormant and less able to resist. More roots survive when the stalks are cut with sharp hoes or with mowing machines than when stalk cutters are used, which breaks or bruises the bark at the surface of the ground.

"No special methods are known to have been developed for cultivating or irrigating second year cotton, except that more water is required to support more rapid growth of the plants in June and July, when the days are long and periods of very high temperatures are encountered. The need of water has to be determined by observing the behavior of the plants to avoid forcing or checking their growth. In the early stages before the sprouts start or while they are still small very little water is needed, and the ground is warmer if not irrigated. As with first year cotton better results are obtained if the plants do not become too rank, but during the fruiting season an adequate and regular supply of water must be maintained to secure a full crop and avoid injury to the fiber."

GROWING ANNUALS

It may be that more annual flowers would be grown if their needs were better understood. Soil for perennial crops, trees and shrubs is built on a permanent base and the food therein may be available over all the year, or for years, and so constituted may be considered good.

Not so with the annual crop, however. This class of plants makes its full growth in a few months and completes its life cycle in less than a year. For this reason soil conditions should be ideal for a short time, but highly ideal. Soil must be rich with immediately available foods, for the growth is rapid and sustained, even though the period be short. Drainage should be good, yet soil moisture must be sufficient and equably maintained. Competing weeds must be suppressed or exterminated. It must be evident, then, that soil for annuals needs more careful preparation for the top few inches than for more permanent crops. If this be understood and carried out the growth of annuals will become more popular, because successful.—E. B.

CAROBS VARIABLE

R. S. Woglum, while in Europe a number of years ago, noted that carobs grown at Malaga were monoecious (flowers of both sexes on one tree), while at Valencia the varieties were dioecious (sexes on separate trees). The trees were grown in the same field with olives and seemed to be more drouth resistant. Some of the trees are said to live 200 years.

A pure bred sire is an asset of any community. A scrub sire is always a liability.

Quick Gopher Eradication

On April 2, 1921, our illustrated "Successful Gopher Trapping" article appeared in the Pacific Rural Press. April 3, Mr. J. Aschwanden of Santa Cruz, Calif., who read the article, sent us 75c for one of the **Chubbuck Double Catch Gopher Traps,** which trap went forward April 5, the day we received the order. Below is one of the four illustrations used in the Press article:

Catches Gopher Any Size or Age

Today, April 12, we are in receipt of the following letter from Mr. Aschwanden:

Santa Cruz, 4-9-21.

E. J. Chubbuck Co.,
San Francisco, Calif.

Dear Sirs: Received trap and your letter on the 7th, and on the 8th I set the trap seven times and caught seven gophers all in one day, and some of those I could never get before with several different kinds of traps, nor with gas. I assure you that I am highly pleased with your trap, and you can look for more business in the near future from my neighbors as I am telling every one of them about it, and show them the good results. Thanking you very much, I remain, J. ASCHWANDEN.

Reports like the one made by the Santa Cruz customer have been coming in from all sections. Four days ago we shipped a full gross **Double Catch Traps** to one California Ranch. The attention of the Superintendent of the ranch had been called to our trap by an advertisement in the California Cultivator.

If you cannot secure these traps from your local Seed stores or Hardware dealers, send direct to us. **Price, postpaid, 75c.**

Annual White Sweet Clover

Guaranteed Seed of the Hubam or Hughes Variety

Makes growth in one season that ordinarily clovers do in two. Yields under cultivation two tons hay or 300 to 800 pounds of seed. Price $1 for trial package or $10.00 per pound. A pound will seed an acre. Make a big profit growing seed for yourself and neighbors. Order before small supply is exhausted from The Henry Field Seed Company, Shenandoah, Iowa, or direct from **The Grower Who Guarantees.** The DeGraff Food Company, Degraff, Ohio.

LET your chick babies be buttermilk babies this year and watch 'em thrive and grow. Start them right, start them on Globe "A-1" Baby Chick Mash, **the buttermilk baby chick mash.**

There is practical and scientific knowledge put into Globe "A-1" Baby Chick Mash. It isn't just a feed. It's that and more—a health protector. The generous quantity of pure dry buttermilk which it contains gives it this invaluable property. The lactic acid content cleanses the baby chick's system, and protects it from the ravages of disease. **(It has proved a preventative of white diarrhoea and coccidiosis.)**

AFTER THE CHICKS ARE OLDER

After your chicks are about 6 weeks old change the ration to Globe "A-1" Growing Chick Mash (containing dry buttermilk) and when the pullets are 5 months old begin to feed Globe "A-1" Laying Mash (containing dry buttermilk) and get ready for the full egg basket.

Nutritious hearts of grain, meatine, selected ground grains and plenty of pure dry buttermilk—that's Globe "A-1" Baby Chick Mash—why shouldn't the chicks grow well on it?

GLOBE A-1 GUARANTY

"Money's Worth or Money Back"—a guarantee as sound and as liberally made as are Globe A-1 Feeds.

If you are not pleased to have our Product, we are not pleased to have your money.

Your Dealer cheerfully backs this guarantee.

Prevent Blackhead in Turkeys

By R. R. McLean

John S. Buckley, chief of the pathological division of the bureau of animal industry, U. S. D. A., has stated that in some districts it is practically impossible to raise turkeys because of the presence of the causative agent of the disease of blackhead. Not only is there great financial loss to the poultryman, but many persons are deterred altogether from entering the business and the consuming public pays higher prices because of the fewer numbers and increased cost of raising turkeys.

A preventive treatment for this destructive disease has just been announced by Drs. H. M. and Paul Wegeforth of San Diego, in the Journal of Pharmacology and Experimental Therapeutics, published at Baltimore. R. R. McLean who writes the account of the discovery of the Drs. Wegeforth is connected with the farm service department of the First National Bank of San Diego. It appeals to us that this discovery may lead to greater extension of this branch of the poultry industry.

BLACKHEAD was first brought to public notice about the year 1892 when it became extremely serious in Rhode Island and Maryland. Many investigators have worked on the problem since then, Dr. Theobald Smith, at one time chief of the United States Bureau of Animal Industry, finally discovering the causal organism, named by him as "amoeba meleagridis," and classified the disease as an entero-hepatitis, or inflammation of the liver and intestines. This organism is one of the lowest of the animal kingdom and is closely related to that producing a form of dysentery in human beings. During thirty years practically no headway whatever has been made in combating it although several investigators have had slight success with rather complicated courses of treatment. All of them have finally turned their attention to the possibility of the prevention of infection rather than cure.

The Wegeforths did not become actively interested in blackhead until Dr. H. M. Wegeforth established a poultry ranch in Paradise Valley, San Diego, where climatic conditions are ideal for this industry. On absolutely new ground where so far as known no turkeys had ever been raised before, 40 birds were raised the first year from stock brought from Ohio, no disease appearing. The next year, 1915, without any new birds or eggs being brought to the ranch, blackhead suddenly appeared and more than half of the young stock and one of the old birds died. During the next year, 1916, only one bird out of 80 hatched survived, although 60 reached the age when they were able to roost in the trees. The entire stock was then disposed of and the ranch moved a quarter of a mile to new ground on which turkeys certainly had not been for 20 years and probably not before then. The first year no blackhead appeared, but the second, 1918, out of a hatch of 210 all but 72 died, most of them from this disease. Conditions were repeated in 1919, as out of 209 young turkeys all but 52 died, the disease attacking them at six weeks of age, and undoubtedly most of the few left would have died also but for the institution at that time of the new treatment.

The Paradise Valley Poultry Ranch is used exclusively for the breeding of fine stock, some of the finest bronze turkeys in the United States being produced here. The pens are headed by the famous Copper King V, twice a national first prize winner, and the financial loss sustained at this ranch because of blackhead was accordingly much greater than the number of deaths would ordinarily indicate.

The malady known as blackhead has been by some partly attributed to a predisposition on the part of the young turkeys to catch cold and die if they got their feet or feathers wet in the grass or if caught in a rainstorm, and by others to over or improper feeding. Many experiments were tried by the Wegeforths with various kinds of food, laxatives, tonics, etc., without any noticeable results except in some instances to apparently increase the mortality. When it seemed as if the entire flock would be exterminated their attention was drawn to Dr. Smith's conclusions of the amoebic origin of the disease, and this suggested to them the use of the same remedy that has proved so valuable in cases of human enteritis of amoebic origin, namely ipecac.

In September, 1919, experiments were begun with the use of this drug, there being, as stated, 52 of the young birds still living out of 209 hatched that year. Blackhead was raging in the flock, some of the older birds also being attacked. The first treatment consisted in separating the sick birds from the flock and giving them 10 drops of fluid extract of ipecac three times a day, continuing this dosage for three days and then decreasing to 10 drops twice a day for three days, and then finally once a day for the same period. After treating six or eight turkeys they found the sick birds were recovering and could be put back with the rest of the flock. Out of the 52 young birds 32 were attacked by the disease and under the ipecac treatment 29 completely recovered. Five old birds contracted the disease at this period and were given treatment, resulting in the recovery of three, the other two being rather far gone when treatment was resorted to.

For the purpose of determining if the disease could be prevented from developing, 18 nearly full grown healthy birds were obtained from a distance and fed with a quantity of ground intestines and liver of a turkey that had just died of blackhead. It had been previously proven (Moore 1896) that the disease could be transmitted from turkey to turkey in this manner. These birds were then separated into three pens, the six in the first being given the fluid extract of ipecac treatment, those in the second being fed with a mash containing three teaspoonsful of powdered ipecac to the quart for three successive days and those in the third pen being used as a control and given ordinary food with no ipecac. No birds from either of the first two pens contracted the disease but in the third pen four died of blackhead within 60 days, two remaining healthy.

Experiments were resumed in the spring of 1920, powdered ipecac being given in the food. The dosage used was a teaspoonful twice a week for each unit of 20 turkeys, no difference being made for age or size. One hundred and six birds were hatched this season and allowed to run with the older turkeys over ground that was thoroughly infected with the disease but no blackhead appeared in the flock. Up to the time this report was made no blackhead had appeared among either old or young turkeys in the Wegeforth flock since the institution of this prophylactic method of treatment, although the disease has been and is still the source of heavy losses among other poultrymen. One turkey raiser in a nearby locality is reported to have lost 320 poults from this disease last year out of 400 hatched.

The following history is given of the symptoms of blackhead by the authors of the treatment which will be of value to those who are familiar with only the later stages:

"For the early diagnosis of the disease it was found that careful inspection of the droppings each day was of great assistance. The first symptom that a bird coming down with blackhead usually shows is a slight lameness of the leg, usually the left. Just about this time the droppings become liquid, frothy and frequent so that it has frequently happened in our experience that detection of such droppings in an enclosure has led to the successful search for a sick turkey. The number of times that this early diagnosis has been confirmed by death and subsequent autopsy has not been without benefit for by its use a great many birds subsequently were subjected to treatment at a time when the best results could be expected. The characteristic droppings were the first symptom in about half the cases observed and have been typical of the disease in about 75 per cent of the turkeys infected. Following the lameness the turkey becomes sluggish and the head frequently, but not always becomes discolored, the fleshy parts taking on a bluish green cast. During

the course of the next day or two the feathers on the rump begin to rise and later the wings and tail droop; the head is carried less erect and the eyes remain closed most of the time, opening, when they do, slowly and languidly. Death sometimes occurs within 24 hours after the onset, but most commonly the turkey succumbs on the second or third day. Turkeys sacrificed at the different clincal stages outlined above have shown a characteristic progression of the infection. If sacrificed early when the bird begins to limp, the caeca alone were noted to be inflamed. Later when the feathers begin to rise over the rumps, involvement of the liver can be found and by the time the wings and tail droop the liver is usually filled with necrotic areas."

The experiments are summed up as follows:

"It has been demonstrated that infectious entero-hepatitis of turkeys can be cured by the administration of suitable doses of ipecac. It has also been shown that turkeys experimentally infected by the feeding of viscera taken from a turkey succumbing from the disease can be prevented from contracting the disease by either the oral administration of the fluid extract of ipecac or by the ingestion of the powdered drug with the food. Further it can be said that the disease failed to make its appearance among the turkeys on a ranch which for several years previous had been visited by epidemics of the disease in a virulent form, the prevention being attributed to the prophylactic administration of ipecac with the food."

As has been the case with nearly every important medical discovery of a remedial nature, this one is also freely given to the world at large by the originators. Without some successful treatment for the prevention of blackhead at least 50 per cent of the young birds hatched every season will probably succumb to the disease, so that the potential economic benefit that may be expected to be derived from the proper use of ipecac can readily be imagined. The simplicity of the Wegeforth treatment and ease of administration, as well as the results obtained, will comend it to every poultryman.

Poultry Queries

Conducted by Jean A. Koethen

White Holland Turkeys

Is there any advantage in raising White Holland turkeys rather than Mammoth Bronze for market purposes?—Subscriber, Blythe.

Some admirers of the White Holland claim that it is a better market bird because it is not quite so large as the bronze, but I have never heard that Bronze breeders had any trouble in disposing of their stock. Birds over 20 pounds in weight do not find quite so ready a market, but not many turkeys of any variety will reach this weight in the six or seven months usually allowed Thanksgiving turkeys.

Chicken Pox

My turkeys have yellow sores on their heads, the heads swell and they go blind. Can you give me a cure?—Subscriber, Winters.

Your turkeys have chicken pox. This treatment was recommended to me recently by a turkey breeder who said she had never known it to fail: Rub carbolated vaseline on the sores, and for purifying the blood use the following mixture: 2½ pounds each of nitrate of soda; copperas, Epsom salts and powdered sulphur; 3¾ pounds dairy salt; 2 pounds carbonate of soda, ½ pound ginger and ½ pound carbonate of magnesia. Add 12½ pounds dry bone meal and 12½ pounds charcoal to the mixture. Mix about 5 pounds of this with 50 pounds of mash for 100 turkeys. When it is gone mix 15 pounds of the mixture with the same quantity of mash, and then a third time use 6 to 10 pounds of the tonic to 50 pounds of mash.

Economical Feeding

At present we are using the following mash with whole barley at night: 50 pounds each of bran, ground sorghum and ground whole wheat; 20 pounds cottonseed meal, 30 pounds beef scrap; 5 pounds charcoal; 1 pound salt. It gives good results but is rather expensive for the present price of eggs. Can you suggest a more economical ration?—Subscriber, Fallbrook.

Your ration is very rich in protein for hens that are on free range. The beef scrap alone is 20 per cent of the ground grain content with the cottonseed in addition, and the ground wheat, another expensive feed, is not necessary when you have a fair quality of bran. I think you could reduce expense materially by making your mash formula 100 pounds bran, 25 pounds ground barley, 25 pounds corn meal, 15 pounds beef scrap and 5 pounds cottonseed or soy bean meal. Soy bean is better than cottonseed because it is less fattening. Then feed as much wheat as you can afford in the scratch feed. A half and half mixture of wheat and milo would be good in cool weather. In summer use wheat and barley.

Rheumatism

Two of our roosters recently began to limp and grew rapidly worse till they lost the use of their legs. Their combs are red and they eat fairly well. The trouble seems to be in the first joint.—Mrs. W., Azusa.

This seems a plain case of rheumatism, probably due to dampness in houses or yards or to exposure to wind. Paint the lame joints very lightly twice a day with a feather dipped in tincture of iodine and keep the birds in a sunny, dry place, where they are protected from wind but still in fresh air. Feed all the green they will eat.

Fertility After Mating

How soon after placing the male with a pen of 12 hens will the eggs be fertile?—Subscriber, Arroyo Grande.

Eggs have been found fertile as early as four days after the male was placed in the pen, but general practice is to wait two weeks before beginning to save up for hatching. Hens are sometimes unwilling to mate with a strange cock and some time must be allowed them for getting acquainted.

LAYING HENS NEED EXERCISE

The necessary close confinement of fowls during cold weather prevents in a measure their obtaining sufficient exercise which is conducive to maximum egg production. The state department of agriculture advises that this requisite may be induced by placing the feed where it will require some exertion on the part of the hens to procure it.

Exercise may be encouraged by depositing grain in litter such as hay, straw, leaves, shredded fodder, etc. This litter should be no less than four inches deep and should not be allowed to become filthy before renewed. Cabbage heads, beets, or mangels, should be suspended or nailed to the wall at a distance above the floor that will require the fowls to jump in order to eat them. Laying hens require considerable exercise and for this reason they should be kept hungry enough to induce some exertion in getting a considerable portion of their feed.

We get Big Egg Production from PCA Dry Mash.

Do you recognize these signatures? They represent some of California's leading poultrymen, prominent and successful in their line.

On their ranches are 67,000 hens fed daily with **PCA** Dry Mash and other **PCA** Products. These owners base their use of **PCA** feeds on practical experience---it has meant more profit for them.

Increase your success in the poultry business by taking advantage of the experience of others.

Use PCA Dry Mash—the economical, perfectly balanced ration for poultry. It increases egg production; assures uniform hatches; conditions stock; gives lasting benefits, and is acknowledged by poultrymen who feed over 622,000 hens as the most profitable mash obtainable. You can safely follow in the footsteps of these poultrymen who have had years of experience.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock April 12, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies liberal, market firm. Stocktons: Burbanks, quality poor, 1.75@2.00; few best 2.25@2.40. Idaho: Russets mostly 2.35@2.50. New potatoes: Best 2.10@2.35 lug. Sweet potatoes: Supplies liberal, market steady. Best mostly 2.25@2.50 lug. Arkansas and Texas, 7@8 lb.; jobbing sales, mostly 6½@7 lb.

Onions: Supplies heavy, market dull. Stocktons: White Globes, cold storage stock, 75@1.00; Browns, mostly 35@65 per cwt., sacked.

Garlic: Local best mostly 10@12 lb.; poorer 7@9.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock April 19, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Best doz., 1.00@1.25; poorer wide range.

Asparagus: Market strong, supplies liberal. Local: Mostly 13@18 per lb. Northern, 11@14 per lb.; jobbing sales 10@12 per lb.

Beets: Doz., 30@35; sk., 1.75@2.00.

Cabbage: Field crate best mostly 90@1.10; poorer, 60.

Carrots: Doz., 35@40; sk., 1.00@1.25.

Cauliflower: Supply moderate, field cr., best, 2.25@2.50; poorer low as 1.25; few best high as 2.75.

Cucumbers: Hothouse, best, 3.00@3.25 doz.; poorer 2.75.

Lettuce: Local field crate quality poor, 1.00@1.25; best mostly 1.50; few high as 1.75.

Peas: Local: Best 7@9 per lb.; jobbing sales 6@8 per lb.

Radishes: 20@28 doz.

75@90; Strawberry bx., 1.20@1.35.

Spinach: Mostly 20; few best, 25 doz.

Squash: Summer, mostly 1.10@1.20; jobbing sales mostly 1.00.

Tomatoes: Mexican, per lug, best 4.00; repacked lug, 4.25; few crates Imp. Valley 3.50.

Turnips: Doz., 35@40.

FRESH FRUITS

Strawberries: Supplies increasing, market steady but lower. No. 2 mostly 4.00@4.50; No. 1 mostly 5.00@6.00.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.25, special packed brands 2.75@3.25.

Lemons: Supplies heavy, market dull, wide range in prices. Local: packed box 1.50@2.25, few high as 2.75, loose 75@1.00 per box, per lug mostly 40@50.

Oranges: Supplies heavy, market firm. Navels, market pack, large sizes 3.00@3.50 small low as 1.75, special brands, small sizes 2.75@3.25, large sizes 4.00@4.50. Packing house culls 25@50 per box, few best 75. Tangerines: Supplies liberal, market steady, lb., 4@6.

HONEY

Supplies of honey are still generally heavy, but old crop is cleaning up in some sections. Poor wire inquiry. Movement slow, market weak. Carloads f. o. b. usual terms: Per pound, few sales of White Orange Blossom 12½@13; White Sage 12@12½; light Amber Alfalfa 6@6½; Light Amber Sage 7½@8½; White Alfalfa 7½@8; Hawaiian White 7; Light Amber 6; Honey Dew 4½. Producers are reported as offering contracts for new crop. White Orange Blossom 10 per lb., but buyers are holding off. Prospects for the honey crop are generally favorable throughout the state, except in the San Diego district and Salinas Valley, where rainfall has been very light. Darker grades of honey are now on cheap price basis and competing with sugar for commercial use. The outlook is for a continued downward trend in prices for the darker colored stock.

GRAIN AND FEEDS

Grain Exch. price bid April 19:
Barley: Carlots, 1.18¾.
Corn: Bulk, No. 3, Yellow, 1.45.
Milo: Eastern No. 2, bulk, 1.45.
Bran: Kansas, 28.00.

HAY

Alfalfa Growers of California report under date of April 18:

The markets for grain and feeding stuffs reached new low levels during the week under the influence of which the market for alfalfa continued dragging and inactive. It would seem as if in consequence of the apparently endless decline in the prices of all farm products prices had ceased to be a factor in the demand; in fact, the lower prices go the more buyers become frightened and timid, and the less they are inclined to buy beyond their most immediate needs.

There were 600 tons received on the Los Angeles tracks the week ending April 16, with 60 tons held over as against 380 tons the week before.

Rabbit Alfalfa	25.00
No. 1 Dairy	21.00
Standard	18.00
Stock	15.00

Kafir: Eastern, 1.45@1.55.

HAY AND FEED

Alfalfa Growers of California report under date of April 18:

No. 1 Dairy	18.00
Standard Dairy	16.00

Under date of April 16, A. W. Scott Co. says:

Receipts past week 700 tons. Light arrivals are undoubtedly the result of oversupply during the preceding two weeks and the difficulty of marketing receipts. Shippers in all directions have been holding up until our local market could digest what has already been received. Under these conditions, although quotations are unchanged, there is no firmness to any prices and the trend of the market this week closes strongly in buyer's favor. Better grades are somewhat scarce and more easily handled, but lower grades of oat, barley or stock hay drag and are especially hard to move. The dull condition of the market has been impartially manifest in local trading, in export and shipping and also throughout the interior of the state. Alfalfa continues dull and demand extremely light by reason of the pasture conditions.

Mill and dairy feeds continue in deplorable condition. The daily dropping of grain markets to a new "low level" each day has a depressing effect and prevents any trading except in the most insignificant quantities and for immediate consumption. Prices on mill products have declined in proportion to the reductions of whole grains and close at figures we quote below.

Coconut meal and alfalfa meal are moving slowly but steadily in small day by day sales. Beet pulp, molasses and the various nut meals are very slow to move and practically are only marking time.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Tame Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00
Straw	10.00@15.00
Barley, ground	31.00@35.00
Barley, rolled	27.00@30.00
Oats, Rolled Feed	34.00@36.00
Bran, Red	34.00@35.00
Bran, White	36.00@38.00
Millrun	35.00@40.00
Middlings	47.00@50.00
Linseed Meal	60.00@65.00
Cocoanut Meal	26.00@27.00
Alfalfa Meal	28.00@29.00
Cottonseed Meal	35.00@40.00
Sugar Beet Pulp	30.00
Molasses, Tanks	23.00
Molasses, Barrels	26.50
Milo	35.00@40.00
Corn Meal	35.00@40.00

Citrus Markets

Los Angeles, April 20, 1921.

Navels are bringing better prices, especially on medium sizes. Practically all Navels are now in hands of shippers. The regular movement of Valencias is now on, a fair supply going forward from Central and Southern districts, though shippers of Sweets and Seedlings are still holding back owing to the heavy supply of small size Navels, still in the market.

Lemons show no improvement over last week's conditions. There are 20,000 boxes of foreigns in sight for the next 30 days sales.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 17,342 cars; lemons, 3,537; total, 20,879. To same date last season: Oranges, 14,399; lemons, 2,783; total, 17,182. From Central California to date, this season: Oranges, 4,523; lemons, 129; total, 4,652. To same date last season: Oranges, 4,052; lemons, 281; total, 4,333. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261, lemons, 22; total, 283.

THE QUEEN BEE

By Henry Perkins

THE queen is the only reproducing female in the colony; she is the sole egg producer; therefore upon the character and prolificacy of its queen depends the strength and vigor of the colony.

The queen normally lives two or three years during which time she produces upwards of a half million eggs. She lays both male and female eggs, apparently laying each gender at will. The bee passes through three stages during incubation, the egg, the larva, and the pupa. The male egg produces the drone. From the female eggs come the queen and the worker bees. Thus from two kinds of eggs we have three distinct types of bees. Let us see how nature accomplishes this marvel. First it must be understood that the workers are non-reproducing females. Their reproductive organs are negative, occurring only in microscopic outline, and are without function, while their honey gathering and secreting organs and defensive instinct are fully developed. In the queen the very opposite is true.

This difference in development takes place during the incubation period and is due to the difference in shape, size and position of the respective cells in which the eggs are laid, also to quantity of food supplied by the nurse bees. The eggs intended to produce worker bees are laid in worker cells which are the ordinary cells of the honey comb; the queen cell is much larger, being about the size of an acorn, and has a downward falling position.

The queen larva is fed much more lavishly than the worker larva. The result is that the larva incubated in a queen cell will emerge a fully developed virgin queen in 14 days time as against 21 days required to produce a worker bee from a worker cell. Both are from the same kind or gender of egg.

On this point there is not the slightest doubt. The proof is found in the case of a colony that suddenly loses its queen. The workers select a number of worker larvae, a half dozen or more, around which they build queen cells, cutting away the adjoining comb to provide room. The result is that the larvae which ordinarily would have become workers now are transformed into queen bees. The first queen to emerge immediately goes about destroying all the remaining queen cells in the hive. If two or more emerge about the same time a battle royal follows. The strongest survives and she will tolerate no rival in the hive. The young queen mates when she is about seven days old. The mating takes places on the wing, never in confinement. The queen mates but once. There is no doubt on this point. A purely mated Italian queen will produce pure Italian bees year after year even though she is removed and kept in a country where no bees of her race are to be found.

The male or drone egg is laid in drone cells which are somewhat larger than worker cells. Drones are only raised during the active season and disappear with the approach of winter. The drone has no means of gathering nectar and would starve to death were it not for the stores brought in by the workers. From the foregoing it will be seen that the beehive is a female suffrage layout from start to finish. It works surprisingly well.

BEE NOTES

By G. W. Bercaw

Possibilities in beekeeping for the beginner are measured by the limitations of his zeal and applied energy.

There are but few people who make beekeeping a special business. A man or woman with ordinary intelligence and physical ability may handle bees and make a success of it. As a rule the investment is small. It should, however, be regarded as a business, and it must have due care and attention at the proper time.

Bees are subject to the ravages of disease and have natural enemies similar to those found in other insect life. Their diseases are easily detected and readily controlled. Of course bees will sting; it is their natural weapon of defense. Study their habits and ways and this fear of stings will gradually pass away and handling them will become fascinating.

A complete knowledge of beekeeping is not necessary for the successful handling of bees, but it is advisable, if one can, to work with some practical up-to-date beekeeper for a season.

California is the largest honey producing state and ships annually several hundred cars of honey to other markets. It would seem that the possibilities at the present time are fully as good as they have been in past years. In many localities where a few years ago large bee yards were prospering, now there are communities and cities, which naturally compels the beekeeper to seek other pastures. As in all lines of industry we find new, improved equipment and labor saving devices, so are the auto truck, the gasoline engine and other modern appliances aiding the bee industry. Honey and bees are rapidly transported from place to place and gasoline engines run the power extractors, etc.

COMING EVENTS

Farm Bureau Picnic, Davis, April 23.
Sierra Madre Flower Festival, April 28-30.
Raisin Festival, Fresno, April 29-30.
California Valencia Orange Show, Anaheim, May 17-22.
Rose Carnival, Portland, Oregon, June 8-10.
Citrus Institute, Whittier, between June 20 and 30.
California State Fair, Sacramento, Sept. 3-11.
Southern California Fair, Riverside, Oct. 11-16.
Los Angeles Livestock Show, Los Angeles, Oct. 16-25.
California Association of Nurserymen Annual Convention, Exposition Park, Los Angeles, Oct. 20-22.
California Horse Breeders Association, Los Angeles, Oct. 30-Nov. 5.
Stanislaus County Poultrymen's Association Show, Winter Garden, Dec. 4-7.

NEVADA BEEKEEPERS

The Washoe County Beekeepers Association has been organized in Reno, Nevada, to meet the third Thursday of each month in the rooms of the Reno chamber of commerce and the officers elected for the ensuing year are: George G. Schweis, president; O. D. Downing, vice-president; L. D'A. Prince, secretary-treasurer. Executive committee, C. L. Cox, Ralph M. Guthrie and F. M. Kleppe.

THE WHITTIER INSECTARY

The state department of agriculture is now prepared, through its branch insectary at Whittier, Los Angeles County, to furnish the whole state with parasites of the black scale and citrus mealy bug. In the basement of the main building there are racks containing 1,500 trays or boxes 14½ by 16½ inches, each filled with potatoes in the sprouting stage. Upstairs is a glass house with a capacity of 1,000 trays, where the boxes are taken for infestation by scales and parasites. In addition to this there is a breeding house, recently moved from the Leffingwell ranch, where the parasites will be bred and collected for shipment. After June 1 it is expected to turn out 10,000 Cryptolaemus Montrouzieri daily, enough to supply the entire state. A few boxes are covered with stout wire netting of about one-fourth inch mesh, to restrain the potatoes in transit to South Africa, and as soon as these boxes are properly infested they will be shipped to Cape Town. This insectary is in charge of H. M. Armitage, assisted by Harold Compere and a staff of workmen.

BEAN WEEVIL

California bean growers have suffered great losses because of weevils. Roy E. Campbell, scientific assistant of the bureau of entomology, U. S. department of agriculture, has been in California several years investigating bean weevil and making other truck crop investigations. He is the author of Bulletin No. 807, which reports very particularly as to the investigation of the one pest of the broad bean—the weevil. In the introduction he says:

The growing of broad or horse beans in California during the last few years has been seriously handicapped everywhere by the presence of the broad bean weevil (Bruchus rufimanus Boh.). The practical impossibility of growing uninfested beans caused the early abandonment of a considerable acreage. The greatest abandonment, however, followed the ruling, according to the federal food and drugs act, that weevil infested broad beans are adulterated food and that their shipment was prohibited in interstate commerce.

The bureau of chemistry first ruled that beans infested "to any material extent" could not be shipped, but later changed the ruling to allow shipment to any lot which contained "not more than 15 per cent of wormy or weevil infested beans." The 15 per cent limit is tentative only. Acting under this ruling a shipment of broad beans from a San Francisco broker was seized in New York, after having been found to be over 25 per cent infested. The broker was tried for violating the food and drugs act, convicted by a jury and fined $150. Since then many dealers have refused to handle horse beans, while those who continued to deal in them have had to exercise caution that no shipment contained more than 15 per cent infested beans, or else run the risk of confiscation. The numerous confiscations during the past few years of shipments in transit by food inspectors, and the cost of hand picking to keep the infestation within the 15 per cent permitted, has resulted in keeping the price of beans low and reducing the acreage.

Although the bean is commonly called the horse bean, the name is somewhat a misnomer, as only about 30 or 40 per cent of the crop is used as stock feed. The larger portion is shipped to New York and other Eastern cities where it is used for food by Italians and Portuguese, and is known as fava. Other names are English bean, Windsor bean, and tick bean.

The horse bean is used also as a green vegetable and of late years has been planted to a considerable extent as a winter cover crop, especially in fruit orchards. A recent farmers bulletin recommends further plantings along the Pacific Coast, the Gulf of Mexico and the South Atlantic states, not only for the dry beans for human consumption, but also for the green vegetable, stock feed and green manuring.

Tne recommendations as to controlling this pest are given in the following short sentences:

Only uninfested or treated horse beans should be used for seed. All horse beans used for seed which are infested with the broad bean weevil either should be treated with carbon disulphide or held over in tight receptacles until the second year, when the weevils will all be dead.

Carbon disulphide should be used at from 7 to 10 pounds per 1,000 cubic feet, for at least 24 hours, in a box, barrel, or room as air tight as it is possible to get. The smaller amount is effective in perfectly tight receptacles, but the larger amount should be used if the fumigating box or room is not tight. The liquid should be placed in a shallow pan at the top of the box or poured over the seed.

Infested seed which has not been treated and is held in warehouses or barns near broad bean fields, except that held over for seed until the second year in tight receptacles, should be disposed of or fed before the planting season.

Badly infested seed should be ground up in feed mills immediately after harvesting.

Planting should be delayed until as late as possible, preferably after March 1. In the dryer and hotter localities where this is not possible it is especially important to plant only seed which is uninfested or has been treated to kill the weevil.

All growers of horse beans should cooperate in carrying out these measures.

ANNUAL FLOWERING PLANTS

For natural beauty and pleasing color effects it is hard to beat some of the old fashioned flower gardens of annual plants. Nowadays temporary plantings are not relied upon when conditions will warrant the use of more permanent material, such as shrubs and perennials. Annual flowering plants, however, should certainly be encouraged where planting for winter as well as summer effect is not possible, says Farmers Bulletin 1171, "Growing Annual Flowering Plants," recently published by the United States department of agriculture. The bulletin outlines different ways of utilizing annuals, tells how they should be started and grown, and describes many of the common varieties. It is a practical guide for the cultivation of such plants and will be found useful by all flower lovers. It may be secured free on application to Department of Agriculture, Washington, D. C.

WEATHER REPORT

San Francisco, Cal., April 16, 1921

CALCO Bins *are designed on Scientific Principles*

Every year that you have handled your grain in sacks, many dollars worth has been wasted in the fields. Such waste has been one of the main reasons for the change from sacks to bulk handling. The savings so effected will amount to thousands of dollars more than the cost of all the necessary bins.

Calco Grain Bins are manufactured by a company that specializes in the manufacture of metal products for the farm. You can not over-estimate the importance of this fact—that **these bins are constructed by a company that knows** WHAT IS NEEDED **and knows** HOW TO MAKE IT.

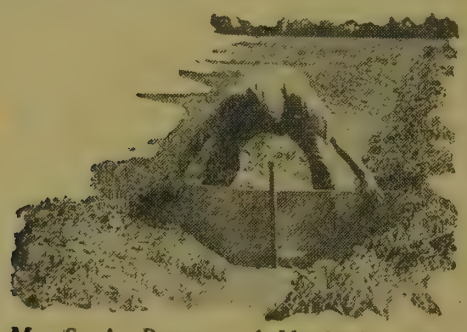
Calco Grain Bins are lasting installations —made of heavily galvanized "Armco" Ingot Iron.

Send the coupon at once for a list of the many sizes and the prices.

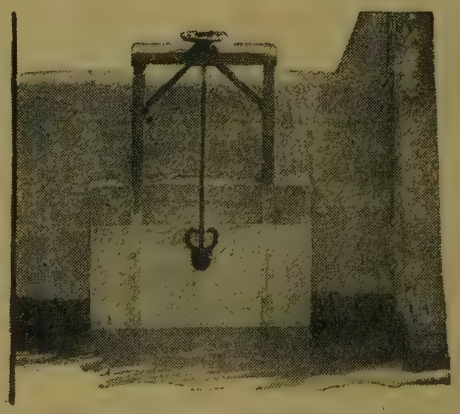
Calco Irrigation Specialties

Calco Adjustable Irrigation Dam
Model No. 254

For checking the flow of water in ditches at any point and backing it up. Light and simple to use. Much less work than shoveling dirt and lugging planks.



Mr. S. A. Brewer, of Hanford, writes: "The Calco Adjustable Dam is a great saver of labor and time, and is all right."



"Armco" Lateral Headgate
Model No. 153
(N. B.—Wooden frame built by user)

A very strong, sheet metal gate for varying heads of water up to 6 feet from center of pipe. Slide operates easily and rapidly. This gate will not warp, crack or rot.

Calco Irrigation Tappoon
Model No. 270

A simple, low-priced and effective tappoon for small ditches. Made of a single plate of galvanized "Armco" Ingot Iron with a roll at the top which forms a handle.

"Armco" Irrigation Gate
Models No. 160 and 161

The hinged slide is operated through a slot in top of pipe. Corrugations grip the ground and hold gate in place. Made with or without bulkheads. The use of these gates in place of the old-time wooden checks will save time, labor and water.

Calco Automatic Drainage Gate
Model No. 100

Designed to drain tidal and other low-lying lands and irrigated areas without power or supervision, and to protect them against **back-flow.** This gate is simple, durable and very effective. It often replaces far more expensive structures.

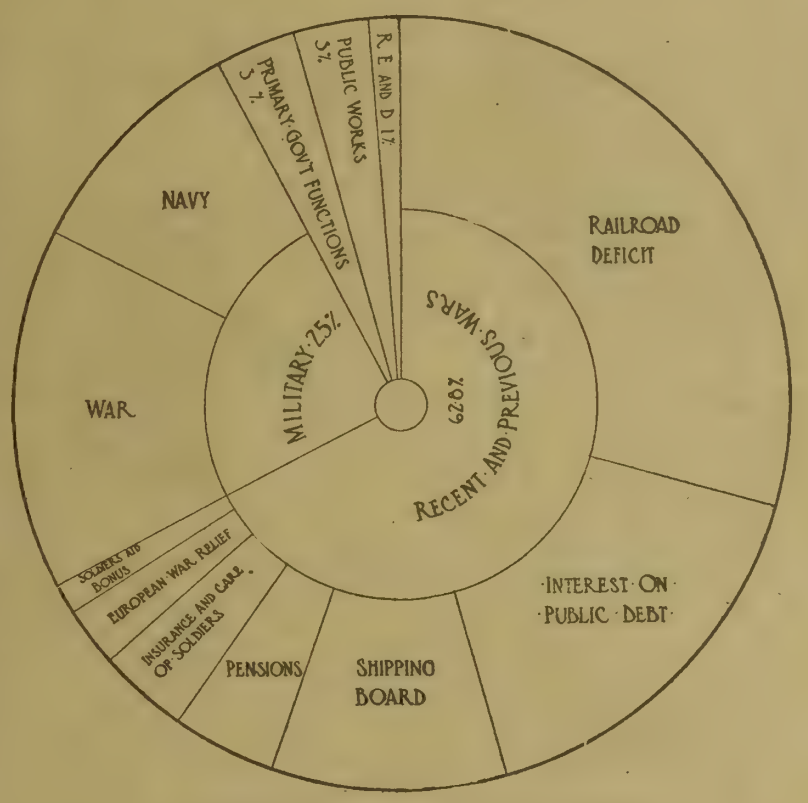
A Mighty Thin Slice for Agriculture

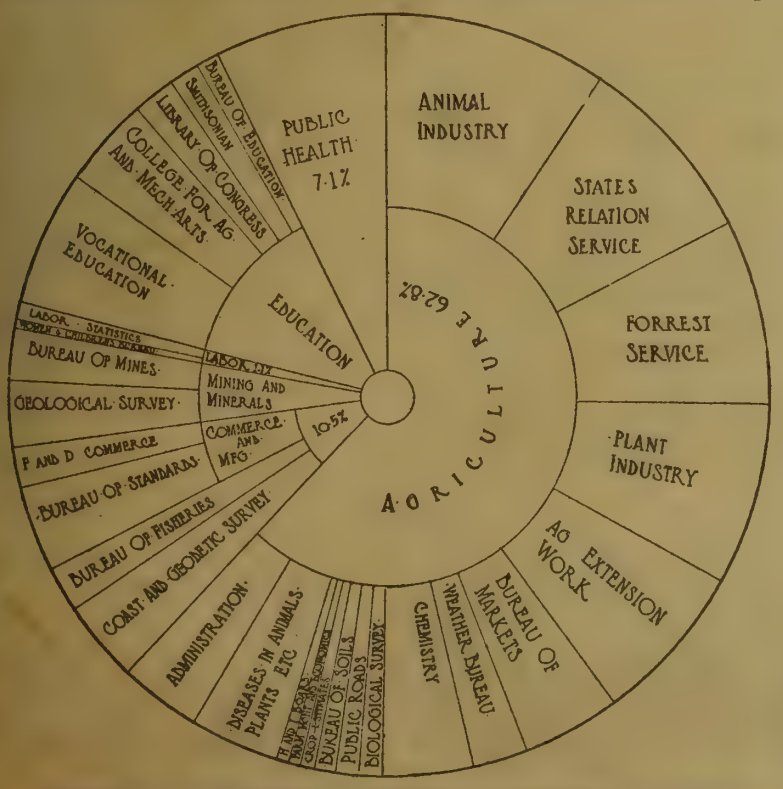
DURING the campaign of the mortgage concerns against the federal farm loan movement the charge was often made by those opposed to it that the farm loan was nothing more nor less than favoritism to one class. The supreme court decided otherwise. This attitude against justice for the farmer is the result partly of prejudice, more of years of legislation which has favored other interests. These interests look askance at any effort toward justice in marketing or in financial dealings with the producing class.

On this page appears a chart showing distribution of government expeditures. The government may be favoring the farmer—for much has been made of the 13 or 14 or even 20 millions of dollars appropriated annually for the department of agriculture—, but how does it compare with other expenditures of the government?

Note the upper of these charts. As a result of the war and legislation in providing for the railroad deficit the railroads get more than one-fourth of all government funds. Interest on public debt is quite a respectable little segment in the circle; war comes next; then the navy; shipping board, pensions, war relief, soldiers' bonus and a few other items are almost negligible in



Distribution of Government Expenditures 1920



Distribution of Expenditures for Research, Education and Development

comparison. That little thin piece of cheese, the smallest in the entire circle, "R. E. and D. 1%," means the amount of money which the government appropriates for research, education and development. The vast number of interests covered by this thin slice in the appropriations is shown by the chart at the lower portion of the page. It will be seen that but little more than half of this, or a little more than two-thirds of one per cent of total government expenditures, goes to aid agriculture in any way.

We are indebted to the agricultural legislative committee of this state for the original of the charts used on this page. The committee writes that these charts were originally published by "The Scientific Monthly." Speaking of the lessons of the chart Secretary Wilson of the committee writes:

"As against this two-thirds of one per cent for agriculture we note that 87.8 per cent was allotted for future wars or to pay for recent and previous wars. Of the amount expended for agriculture a considerable portion is devoted to regulatory work such as meat inspection and similar functions which have no relation to research or education.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The colossal blunder in railroading, beginning early in the war and not yet ended, is made most plain, even to the wayfaring man who will take the trouble to look at the chart on the cover. The greatest of all the appropriations made by our government is required to cover the railroad deficit. Still more, the railroads have been granted the right of raising rates until many farm products are forced out of the market because of inability to command sufficient price to pay the railroad charges. Many fruits are shipping by water in order to get into the Eastern seaboard markets with sufficient to cover picking, packing and box expense and still leave a trifle for the producer.

* * *

The first, and probably the greatest, error was the granting to labor a return which, even under war conditions, was unfair both to producers and consumers of the land. The award to labor was not simply that of increase in wages but often shortening hours and tolerating practices which called for a duplication of men for the accomplishment of simplest pieces of work. Naturally, to meet these exactions increase in rates was demanded and this has been granted once, twice, even three times. And, as shown by the first chart on page 1, the prohibitive rates have not been sufficient and the segment containing "Railroad Deficit" indicates the hundreds of millions which the tax gatherer is taking from us and turning over to the railroads.

* * *

The supposition is that the railroads are the necessary link between producer and consumer. Hence, "We must encourage the railways." The time may come when, like the celebrated apple core, there won't be no producers. There can't be if farmers are compelled to lose money on every crop they raise. Their surplus will soon be exhausted and safely lodged in the coffers of the transportation companies which are also feeding on our railroad deficit fund. We believe there was never greater injustice shown than that toward the producing interests of the United States during the past four or five years.

* * *

To meet the lack of the federal government in this matter of educational and research work our state college of agriculture is appealing for sufficient funds to equip and operate for greater efficiency among California farmers. Or, as stated by Secretary Wilson of our agricultural legislative committee: "It is for exactly this reason that we need assistance from our college of agriculture and experiment station in reducing the costs of production. At no time during the past ten years has the spread between the prices of farm crops and livestock and the prices of articles which farmers buy been more than one-third as great as at the present time."

* * *

Imperial Valley forsook everything and followed cotton, at least, cotton became the principal crop of the valley. Our guess is that the same condition will never obtain again. Dairying and the culture of alfalfa, sorghum grains and other staples are coming back; especially is this true as to dairying. At this moment, however, the alfalfa is coming even more swiftly, and it is barely possible the coming summer may show a great surplus, but ultimately the dairy cow will be there to consume it at home. The output of cotton may possibly not be more than 40 per cent that of last year in that portion of the Imperial Valley north of the boundary line; south of the line the production will be 50 per cent of last year's crop. The percentage at Imperial is equalled in the Yuma Valley, or perhaps the acreage may be still more greatly reduced in that section. The planting of the Pima or long staple varieties will be but little encouraged by the lack of success of long staples in the Imperial. Arizona sections will probably continue to plant the Pima variety. But the principal Pima producing section of California now appears to be Kern County, where it has given exceptionally fine results. Farther north in the San Joaquin it has not been so highly favored.

* * *

Those who contributed to the fund raised to feed the starving kiddies of Europe will be gratified to know that the program which called for the feeding and the medical care of three and a half million children has been continued and is approaching its end with the entire feeding campaign carried out at a less expense than was originally estimated. It was estimated that $33,000,000 would be required. $29,000,000 was raised and has been largely expended. $10,000,00 of this was expended under the general direction of the Red Cross for medical supplies and services. $19,00,000 went for food. It is said that the $29,000,000 went entire to the hungry children; not a cent going to overheard, that being carried by Red Cross and other organizations. It has been estimated that $1,000,000 of these children are alive today because of America's big-heartedness.

* * *

The blessings of the Panama Canal are just beginning to be realized. We believe the most striking proof of this is in the shipment of perishable fruits from California by the way of the canal to various Eastern ports. Government officials who have been making investigations of the advisability of these shipments report: "The government is satisfied with the tests, and it is merely a matter of working out devices and refrigeration systems for the boats which will measure up to the standards of the railroads. The perishable fruit shipments by water have been successful but there is still work to be done in order to minimize the loss in transit."

* * *

In addition to this direct success there is benefit in the fact that attention of other large shippers is called to the advantages of water shipment. Vessels leaving every few days and carrying as high as 50 cars each of perishable fruit is most significant. Quoting from shipping announcements: "Carrying 21 carloads of oranges and lemons, the Isthmian Line steamer Steel Ranger will sail tomorrow to Boston. The steamer Yalza of the North Atlantic and Western Line clears port at Los Angeles Harbor for New York on Thursday loaded with 30 cars of lemons and 20 cars of oranges."

WANTED—A JOB

Edwin C. Voorhies, secretary of the college of agriculture, is looking for a job for a few score of men and women from that institution, the job to last through the summer's vacation. Farmers, as a rule, have not taken kindly to student help. Recognizing this fact and wishing to give correct idea as to the abilities of these college folks, Mr. Voorhies writes:

"The work which these men have done during the past has been most satisfactory to practically all of the farmers who have engaged their services. We are particularly anxious to continue this cooperation with the farmers of the state. We would call their attention to the fact that these students are men capable of doing a day's work. Unfortunately, in the past they have been confused with boys going out for a lark and youngsters of immature years. In addition to these men there are 30 or 40 young women in the college of agriculture who are also desirous of getting out to do real work."

CHEAPER LARD

Now comes appeal from one of Chicago's largest packers for relief from the inroads on lard because of "unduly increased sales of vegetable oil shortening put up as substitutes for lard." It is rather startling to have this appeal come from this source, for the large packing concerns have usually been considered responsible for much of these sophisticated butters, lards or shortening supplies. But of course it is important that these "inroads on lard" be told to the hog producers of the land, for it makes a remarkably fine reason for lowering prices to the lard producer. "Heretofore the packers have been able to give a liberal credit to the live cost of hogs through their returns from the sale of lard as an edible by-product."

So far as we have heard, no promise is made as to the future, but it is to be hoped that swine raisers will be considerate in the matter of prices.

EAT MORE FRUIT

We recently mentioned the campaign for a fruit day or a fruit week, or at least an agitation of the question of a market overstocked with last year's fruit with, as we thought then, a big crop coming. The effort was to induce housewives to purchase one or many cans of last season's stored up fruits. Other plans along advertising lines have been followed and are being suggested. Now comes a newer and more ambitious plan, known as the Bergtholdt plan. Mr. Bergtholdt is a large grower of fruits in Placer County, is vitally interested personally and is more interested as a public spirited Californian. He insists that there is no overproduction and that of the higher grade, staple fruits there can be no overproduction if we but stand together and pull together for a campaign of education as to the healthfulness and economy of making California fruits a greater factor in our diet.

A part of the scheme is the publication of the "Story of California Fruit Foods," a book which shall be made an "indispensable necessity" to every housewife. The production of this book and securing entrance for it into the homes of 15,000,000 housewives is the ambition of Mr. Bergtholdt and those who are joining in this campaign.

It is a big idea and cannot help but increase consumption of California fruit throughout the United States.

PREDATORY EUCALYPTUS

There seems to be no more prolific cause of strained neighborhood relations than the trespassing eucalyptus tree. This particular tree is, however, one of the greatest blessings California has received from the Island Continent. It makes wonderful growth yet has remarkable qualities and, like other quick growers it is naturally a gross feeder, and, again, like other quick growers it soon casts a shade and under certain conditions dams back cold streams of air and causes great frost injury. This injury is usually on the land of the man who does not possess the trees, hence the scrap.

In one case this scrap became so husky that the Merced County superior court was asked to grant an injunction against one for "maintaining a row of eucalyptus trees on his land eight feet from the land of the plaintiff. The trees are intended as a windbreak." The plaintiff claimed these trees were a nuisance and presented his case so skillfily that the judge agreed with him and "the defendant was ordered to remove the trees or to keep them from sending roots over the property line."

Regardless of legal right, moral right and the right of common neighborliness should impel all of us tree planters to confine our planting to the roadside or else far enough from our line that our trees will not forcibly destroy our neighbor's property.

We have known of cases where large subsoiling plows behind a big 75 tractor have been used to lessen the loss. But we fear even that will not be sufficient in most cases.

Vol. LVI, No. 18 | Los Angeles, April 30, 1921 | One Dollar Yearly

Building Up a High Producing Dairy Herd

IT requires a lot of money to enter the dairy business. Especially does it require money if modern equipment and pure bred animals are used at the beginning. But there is a great deal of dairying that is not started that way. In fact, if America depended upon the gilt edged dairy for its milk, butter and cheese supply, America's children would be hungrier than they are now.

This is not intended as in any way a criticism of modern equipment for the dairy. Modern requirements are ever improving in this particular, and it is to be regretted that many of our dairies are not far better equipped than they are. But we need more and more of dairy supplies and where the dairyman is unable to equip and stock as he would like, he still may make a living for himself and family and add to the world's supply of food through installation of stock and equipment such as that of Earl Graham of Compton.

Mr. Graham is not a breeder; he is strictly a dairyman. His capital was limited; he started with "just cows." He had a high fat production, and it was not long until he determined tnat some of his old cows were living at his expense. These were soon disposed of and his knowledge of the lines of the true producers was used in checking up other cows which consumed a vast amount of feed and delivered its equivalent in a marketable product. At the same time he also realized the truth of the slogan, "The sire if half of the herd." The true producers soon supplied other and better producers, and readers of the California Cultivator have seen within the past six months announcement three different times of Mr. Graham's winning of the California Cultivator monthly prize for the highest production by five grade cows (the same cow not being eligible to compete a second time). The highest cow in his latest winning group produced a total of 79.95 pounds of fat and the lowest, 55.70, average production for the five of 62 pounds. Note this is fat production—the butter production exceeded 80 pounds for each cow.

The Cultivator camera was brought into action at Mr. Graham's place and

On the Graham Ranch at Compton

The upper is a picture of Princess Maida Veeman, the pride of the Graham ranch, who has a record of 33.06 pounds butter in seven days as junior three year old. She is a daughter of Sir Veeman Korndyke Pontiac, owned by Burr Farm.

The lower shows Mr. and Mrs. Graham and the youngest member of the family. His older brother was scouring the fields in search of mushrooms at the time the photograph was taken.

the upper of the pictures on this page gives an idea of the type of cow Mr. Graham has been choosing. This one happens to be a pure bred and was not allowed in the competition for the Cultivator prize. The lower picture gives an idea of the sturdy type of workers on the litle farm—and it is little, for there are only five acres. We regret that one member of the family, a boy slightly older than the little fellow by the wagon, is not shown in the picture. He was far away gathering mushrooms, proving himself to be a typical coming farmer.

We asked Mr. Graham how he did it, and he has jotted down a few of the points he considers essentials in the dairy:

By Earl Graham

When dairymen realize the need for greater interest in and care of the dairy cow the average production for all the cows in the country will be greatly increased.

Ever since I began dairying it has been my policy to keep my cows filled up at all times and to try to balance the ration in such a way as to keep them in good condition and still milking well. For the last six months I have been feeding the following ration: 100 pounds ground barley; 100 pounds ground oats; 100 pounds beet pulp; 75 pounds coconut meal and 100 pounds ground corn, mixed well in a big bin and fed one pound grain to four pounds milk in most cases. There are a few cows that will eat and need more grain and I always feed them a little more. I have had better results from that mixture than any feed I ever used. I corral feed my cows all the time with green alfalfa and ensilage. Sometimes I give them dry hay for a change. I always watch and see that they have good appetites. If they don't eat their grain very well I

(Continued on Page 599.)

A Thousand Feet of Onions

Down at Thermal, Riverside County, Geo. M. Beach is considered the premier onion grower. Others may have a larger acreage but none get heavier yields. When roaming over the fields with a neighbor, during Mr. Beach's absence, said neighbor stated that 900 crates of 52 pounds each had been secured from an acre and that the entire Beach crop (of onions) averaged 500 crates per acre.

The rows in the largest field are 1,000 feet long and are irrigated with a single flow of water, the longest run yet attempted in the valley. In spite of a very sandy soil the furrows are well filled with water at the farther end and the time consumed for water to reach this distance is not unreasonably long. The explanation lies in the fineness of the sandy silt soil, for the land is nearly level, an old ocean floor. Because of this soil texture, weeds, except Bermuda grass, are not a serious pest. But in the Coachella Valley Bermuda is indeed a pest and more of a menace to agriculture than all other plant life combined.

Though always successful with onions, Mr. Beach has this year tried

Beach Method of Planting

This three row system puts 80,000 more plants on an acre than the two row system formerly used.

a new method of planting. Heretofore fields have been planted with double rows, alternating with the irrigating furrows. This year he has planted three rows, five inches apart, plants about four inches apart in the rows. The distance between the nearest rows across the irrigating furrows is 20 inches, but as the planting plan is based on "centers" we will say it is 30 inches from middle row to middle row. Mr. Beach said: "I have about 210,000 onion plants to the acre with this method, in comparison with about 130,000 under the old method. I do not expect to get much more yield but will get more uniform size. I also am able to drive through the rows with a team and wagon or truck, which enables me to spray or dust for thrips. I plant my seed about September 5 to 15 and transplant in field during November and into December. It is only an experiment with me and I will be able to tell more about it after the end of the harvest season." But other growers in the valley say: "George knows, and if he has planted that way it will prove a success."

Agricultural News Notes of the Pacific Coast

Northern California

A Holstein-Friesian Association is being organized in Glenn County.

The Placerville farm loan association has resumed business and is considering numerous applications for loans.

The annual traveling conference of the state farm bureau will be held May 23 to 28, touring the San Joaquin Valley.

Farm bureau local meetings in Alameda County: East Avenue, May 3; Independent, 6; Livermore, 9; Castro Valley, 13.

The annual picnic of the Napa County farm bureau will be held at the state farm near Yountville, date to be announced.

The Arcata farm center of Humboldt County is planning to conduct both Jersey and Guernsey calf clubs the coming year.

The seventh annual wild flower show was held at the St. Francis, San Francisco, Thursday, Friday and Saturday of this week.

The potato growers department of the Sonoma County farm bureau has distributed 7,366 pounds of certified potatoes to other counties of the state for seed purposes.

Farm home department meetings in Alameda County: Livermore, May 13; Irvington, 4; Hayward Heath, 5; Castro Valley Girls Club, 6; Orchard Avenue, 11; Newark, 13.

Sheep men of the north gathered at Chico last Saturday, heard report of committee investigating as to freight rates on lambs and made efforts to secure justice to sheep owners.

Alameda County reports serious injury to young fruit by combination of dry rot and frost. The winds have seriously dried out Sacramento Valley fields but favorable weather now prevails.

Chambers of commerce generally in prune growing districts have put themselves on record in favor of encouraging all growers joining the California Prune and Apricot Growers, Inc.

A Guernsey breeders association has been formed in Humboldt County with the purpose of introducing pure bred sires, encouraging organization of calf clubs and to promote the extension of the breed in the county.

The senate committee has unanimously approved the bill appropriating $100,000 a year for two years, to be equally divided between the first and sixth agricultural districts for premiums at livestock shows.

The Southern Pacific railroad police have had a difficult problem during the past winter in the handling of the hobo situation. The number of persons caught trying to beat their way is still astonishingly large.

The poultry committee of the Alameda County farm bureau, the Haywards chamber of commerce and other workers for better poultry conditions are giving housing demonstrations in various sections of the county.

California produces over 98 per cent of the entire American crop of almonds and has done so for many years, according to a recent publication by R. H. Taylor of the division of pomology of the state university, entitled "The Almond in California."

Central California

Modesto is planning to hold a poultry show, December 4-6.

Terra Bella, Tulare County, reports no frost damage to vineyards.

About 2,100 acres are being planted to vineyards in Tulare County this season.

The Kings County farm bureau has located seven cover crop demonstrations in the county.

A bunch of laborers is now constructing railroad from Roscoe to Don Pedro reservoir site.

Stanislaus County orchardists are finding frost damage to fruit not so serious as first reported.

The land settlement board has approved applications for several more allotments at Delhi, Merced County.

Agricultural clubs have been organized in the Arvin, Weedpatch, Rosedale, Shafter and Bardsdale farm centers.

The Modesto chamber of commerce is opposing franchises for truck lines to operate over state and county highways.

A new poultry association has been organized at Porterville, affiliating with the Tulare County Poultry Association.

The California Fruit Growers Exchange has signed up the pack of the Producers Fruit Company. This brings in 700 carloads of citrus.

President Giffen estimates raisin tonnage reduction because of the frost will not exceed 50,000 tons. There will still be left 200,000 tons to market.

It is estimated that the Pine Flat irrigation project will irrigate nearly 1,000,000 acres. The Fresno district is the largest, including 246,000 acres.

The Tulare County Cooperative Poultry Association reports March prices of eggs 30 per cent less than those of the corresponding month in 1920.

Several San Joaquin Valley counties are uniting in fight against Los Angeles applications for power sites on headwaters of the Kings and Kern Rivers.

There has been heavy travel over the Wawona road to Yosemite since its opening, April 2. The season is two or three weeks in advance of the usual year.

Farm home department meetings in the San Joaquin Valley: Farmington, May 3; Bruella, 5; Manteca, 6; French Camp, 10; Douglas, 11; Escalon, 13; Linden, 17; Ripon, 18; Summer Home, 20; Escalon (septic tank), 23; Live Oak, 24; Lafayette, 25.

Consignors to the Tulare auction of the San Joaquin Valley Farm Bureau Marketing Association stopped sale because of cut price offered by bidders. Two carloads were sold at $10 when the consignors decided to haul home the rest of their hogs.

The superior court of Merced County has granted an injunction restraining an owner of land from permitting the roots of his eucalyptus trees to trespass over the line. His trees are planted eight feet from the line and intended as a windbreak. The defendant has been ordered to remove his trees or to prevent the roots from crossing the line. The suit was taken up under the general law of common unisance.

Southern California

Imperial Valley has 750 dairies operating.

Imperial expects to begin shipment of cantaloupes by the middle of May.

Brawley expects to ship out about 500 carloads of tomatoes this season.

Escondido, San Diego County, is making carload shipments of citrus to Eastern points.

Walnut growers along Sespe Avenue in Ventura County report considerable damage from frost.

A new auto freight line is to be established between San Diego and El Central by way of Jacumba.

The California Avocado Association will hold its annual meeting at Hotel Maryland, Pasadena, May 6 and 7.

San Bernardino County farm bureau will hold a livestock day at Ontario, May 4, and another at San Bernardino, May 5.

The Simi Valley Walnut Growers Association is building a new walnut house at Santa Susanna, Ventura County.

The state railway commission has granted to Palo Verde Valley, Riverside County, a very material reduction in freight rates.

Imperial Valley Vegetable and Melon Growers Association is being aided in its marketing efforts by State Market Director Daniels.

Scientists from the University of California have been making inspection of kelp beds up the coast from La Jolla to Summerland.

A course of lectures on poultry production has been delivered by Prof. Easson of the U. C. before the Santa Paula union high school.

A few growers of seed beans at Carpinteria, Santa Barbara County, report contracts for 7 cents for some varieties. 6½ cents is the average figure given now.

Grain growers of Orange County will make an all day excursion on May 4, visiting demonstration plots on various grain ranches in the county. The trip will be under the auspices of the farm bureau.

Manager Churchill of the Lima Bean Growers Association states that there are now approximately 1,250,000 bags of beans in Southern California ready for shipment. This represents about half of the 1920 crop.

It is reported that the Lima Bean Growers Association has secured a reduction in freight rates from 70 cents to 55 cents a hundred on steamer shipments from Pacific Coast terminals to Gulf and Atlantic ports.

Ventura County cattlemen recently gathered at Santa Paula and discussed marketing and prices, and the prediction was made that 8½ cents a pound would prevail for May steers. Ventura County fair management was asked to offer series of prizes for the steer feeder who could show greatest gain.

Ventura County mustard growers grew last year about 3,000 acres of mustard, but most of the seed is still in the warehouses. The outlook is very gloomy and some offers of yellow mustard have been made as low as $2.50 per hundred with no takers. The growers are asking for a tariff of three cents.

The Coast and General

A county cow testing association has been organized in Pima County, Arizona, with J. S. Ayers as president; 372 cows have been signed up.

The farm bureau of Chandler, Arizona, has erected a bulletin board in Chandler where announcements and matters of interest to the farmers will be posted.

In spite of the fact that very few farmers in the Salt River Valley have sold their cotton, payments for water assessments due May 1 are being made promptly.

Unlike conditions over the greater part of Arizona ranges north of the Colorado River in what is known as the "Arizona Strip" are in fine shape and stock have wintered well.

The Oregon Growers Coperative Association has been carrying on experiments in canning broccoli and has been so successful that samples have been sent to eastern brokers, where a big market awaits canned broccoli.

The Frontier Days Celebration which has been an annual affair at Prescott, Arizona, for a number of years, has been set for July 2, 3, 4 and 5. The usual cowboy stunts and contests will be conducted very much as in the past.

From the packing plants of the Oregon Growers Cooperative Association more than 1,000,000 pounds of small sized prunes are being shipped to Germany by way of Sweden. Shipments will be from Portland via the Panama Canal to Rotterdam.

Farmers in the vicinity of Salem, Oregon, are in earnest about broccoli growing. Already 110 acres have been pledged and it is thought that the acreage will amount to more than 150. It is figured that 75 cents worth of broccoli seed will pay for planting one acre.

Preliminary work on the Boulder Canyon on the Colorado River project is being done under authority of congress. Engineers have located a site and are making borings for foundation. Bedrock has been located at a number of points and the outlook is favorable, says Arthur P. Davis, director of the reclamation service.

Oregon is credited in government reports with 5500 acres planted to loganberries. C. I. Lewis of the Oregon Growers Cooperative Association estimates that within a few years there will be 10,000 acres of bearing loganberries in Oregon. On an average of 3000 pounds to the acre this would mean a crop of 30,000,000 pounds.

The state of Washington is going after the loganberry industry, of which Oregon now has 85 per cent. From Marion County there have been shipped this past winter 2,000,000 loganberry plants, mostly to northern Washington. On a basis of 660 plants to the acre this means more than 3000 acres, which will be in commercial bearing in two years.

Two schools in Pima County, Arizona, have adopted a supplementary feeding course for the students. The plan is to furnish the pupils with all the milk they will drink at the mid-afternoon lunch. This supplementary feeding demonstration has been conducted for three months and it is found that the average gain has been 2.12 pounds for each pupil.

Water Conservation

By A. L. Dahl

AS a general proposition national forests are created only in timbered regions, yet in California are vast areas embraced within such forests that do not contain a single commercial timber tree. The cost of administering these treeless national forests is as large, at least, as similar areas anywhere, for hundreds of rangers and fire guards are employed during the dry season to protect the brush covered hills. Hundreds of thousands of dollars have been spent to build trails and fire lanes through the chaparral on the mountain sides, and even a corps of flying men is detailed to patrol the air and detect and report fires.

The sole distinction between desert and garden in the West is water, and water, not land, measures the value of property. There are millions of acres of land, now barren and waste, not because the soil is poor, but because water is not available to make things grow. To enable the irrigationists to maintain a steady flow of water throughout the year it is necessary to conserve every drop of the rain waters that fall on the mountain slopes during the wet season. Natural reservoirs are better than man made ones, and a thick mass of vegetation made up of roots and surface brush is one of the most effective checks against rapid run-off and excessive evaporation. For this reason the thick chaparral which covers the sides of the mountains is valued more highly than a heavy stand of timber would be.

A number of years ago, when the question of conserving the irrigation waters was first taken up, a number of interesting experiments were conducted in the San Bernardino mountains by members of the forest service. This study was to determine the effect of the brush cover on the steam flow of nearby streams, and careful measurements and tests were made in a number of places, extending over a considerable period. As a result of these experiments some interesting facts were disclosed. For instance, it was found, from an examination of four catchment areas, three of which were forested or chaparral covered, and the other non-forested, that the effect of vegetation in decreasing surface flow on small catchment basins is enormous. At the beginning of the rainy season the soil on all four of these basins was very dry as a result of the long dry season. The accumulation of litter, duff, humus and soil on the forest covered catchment areas absorbed 95 per cent of the unusually large precipitation that year. On the non-forested area only 60 per cent of the precipitation was absorbed. In the following three months only three-eighths of the rainfall on the forested area appeared in the run-off, while on the non-forested area nineteen-twentieths, or all but five per cent, quickly ran off. After the rainy season closed it was found that the streams flowing through the forested areas had a well sustained flow long after the streams in the non-forested area had dried up.

Now these results were obtained because the brush growth on the sides of the mountain affected the water supply in several different ways. To begin with the thick mat of leaves, stems and humus on the surface of the ground holds the top soil and prevents erosion in times of hard rains. When the raindrops descend they strike this mass of vegetation and slowly trickle down into the soil just as they would through a sponge. In many places it takes a very heavy rain, long continued, to penetrate the thick mat of humus and detritus, and when the soil is reached the water again meets the obstructions of the root systems, making its progress into the deeper ground very slow. Surface run-off is practically shut off except for long, heavy rains, and even these are held from eroding on steep slopes by the vegetable sponge through which the water must pass. Accordingly every drop of water that falls is imprisoned and forced to work its way slowly into the earth where it is made available for the springs that keep the surface brooks and streams flowing.

In irrigated areas a great deal of water used is pumped from subterranean sources along the river washes. These subterranean reservoirs abound everywhere in the valley but the water plane rises or lowers according to the amount of precipitation during the preceding wet season. This has led the water users to plan to conserve as much as possible all rain water falling in the mountains and prevent its run-off as surface flow during the winter.

As a means of water conservation a new plan has been tried with much success by the various water companies in the Santa Ana district. These companies control about 3,300 acres of land at the head of the valley, and during the rainy season they build temporary dams by using iron posts and wire netting which divert the flood waters coming down the mountain canyons, spreading them out over as wide an expanse of gravel wash as possible so that the water will sink through the gravel instead of flowing off to the ocean not far distant. Every additional inch that can be added to the artesian supply is well worth saving. It cost the water companies about $1,375 to put in one of the dams, which would spread over 110,000 inches of water, and that the plan was a success the first season tried is shown by the fact that the water plane in the district below where the experiment was tried remained normal, while in an adjoining district, where no effort had been made to conserve the flood waters, the water level dropped more than eight feet during the same period.

Another plan which has been successfully tried to save the surface run-off is the building of thousands of little dams, or catchment basins, all over the sides of the mountains. A force of men is kept busy during the dry season placing large stones and other obstructions in the gullies and angles formed by previous rains, the idea being that when the rains wash dead leaves, twigs and other material into these small catchments, they will be held in check and in turn will hold back the surface waters, breaking their force and enabling a part, at least, to sink into the soil. The result of the building of these small reservoirs has been most gratifying to the water companies, and the expense incurred is more than repaid by the water saved.

Since fire is the common enemy to be guarded against during the long, dry months, the forest service maintains a large force of rangers and fire guards, who patrol the mountains on the lookout for fires. Within the last year or two airplane patrols have been used successfully in this work as the air observers are able to fly over the highest peaks and quickly discover smoke a long way off. These planes are equipped with wireless telephones with which the observer can keep in constant communication with men on the ground.

To assist the government in this patrol work nearly all of the water companies donate the services of their own men to help in fire patrol and fire fighting. Supplies of fire fighting tools are kept stored at convenient points in the mountains for immediate use, and to enable fighters to reach all parts of the country in the shortest possible time excellent trails are built and kept in repair. Broad firebreaks, or cleared spaces, are likewise maintained along the base of steep slopes or along the ridges of the mountains. These cleared spaces have been found very effective in checking a fire that could not be otherwise controlled. Most of the construction work on trails and firebreaks is done during the winter months when patrol duty is not necessary. The annual appropriations made for this class of work on the part of county supervisors, water associations and irrigation companies runs into the thousands of dollars, as all interests unite in recognizing the importance of fire protection.

Economic Status of California Birds

By J. W. Tyler

THE early Spanish padres and the civilization following them made known much concerning the coastal region of California, but so far as can be learned they avoided the San Joaquin Valley, as did most of the early naturalists who visited this state. The few survivors of the early stockmen have given me glimpses of the bird life of their time but, for the most part, we must consider the years previous to about 1860 as a sealed book so far as bird life is concerned. In those early years of the settlement of the San Joaquin Valley the yellow-billed magpie was present in great numbers and the great California condor was a regular and common visitant to the plains. One early explorer tells us that he counted several nests of bald eagles around the shores of Tulare Lake, while another records the sight of a dozen or more whitetailed kites together as nothing uncommon in the marsh lands about Stockton.

In the fleeting generation or two that has passed since those days what a transformation has taken place and what a charge—alas!—must we place against those who are responsible for this change. The magpie colonies are gone forever and this interesting species, which occurs nowhere else in the world outside of California, is now represented by only a few scattering groups doomed to utter extermination because the birds are large and of showy plumage and make excellent targets for that all too common class whose insatiable lust for blood impels them to shoot and kill and maim as long as a living creature moves within range of their vision.

The great California condor, the largest North American bird, fed almost altogether on carrion and was, therefore, a highly beneficial species in the years when sheep and cattle perished in large numbers and were left lying where they fell on the unfenced range. This bird, however, fell an easy prey to the poison placed in the carcasses by cattlemen for the purpose of destroying coyotes. Never again will this great creature sail in majestic circles over our now fertile valley. Our children and, indeed, we ourselves will look in vain for its great shadow scudding along the base of the lava capped hills.

The kite, because of its habit of tacking back and forth low over the marshes, disappeared rapidly when the automobile made all the duck hunting grounds of the valley easily accessible. It fed on field and meadow mice, but the hunters neither knew this nor did they care. Theirs were not the crops the mice were destroying.

Out of the vast cattle ranges of the past sprang the great grain fields, and these in turn soon gave way to orchards and vineyards until at the present time we can safely challenge the world to equal us in the value of our annual fruit crops. This rapid settlement of our valley has naturally been accompanied by a great increase in population, with many inevitable changes in its bird life. The number of shotguns and automobiles has also increased apace and the slaughter of the wild creatures still continues. Flocks of migrant birds passing through our orchards in search of insects have been condemned and shot without trial because they were thought to have been injuring the fruit buds. Our hawks, owls and eagles have been killed on sight by farmers who accused them all, both large and small, of stealing poultry, and by sportsmen who feared for the game birds which they themselves desired to slaughter.

We are now beginning to reap the just reward of our deeds. The counties of the San Joaquin Valley are just now spending thousands of dollars of the taxpayers' money in an effort to reduce the number of ground squirrels, which have increased to such an extent as to cause alarming destruction to crops. Let not the taxpayer groan or complain, however, for he has no one but himself to blame. With utter disregard for the consequence he has gone about slaughtering the natural enemies of the squirrels, pursuing them relentlessly even to the most remote parts of our valleys and hills. It is little satisfaction to reflect that much of the constantly increasing expense of insect control might have been spared had the native insectivorous birds been protected and encouraged to make their homes in our orchards and vineyards. Only an enlightened public conscience, an awakened interest in the birds of our or-

Prune Diseases

PROF. H. P. BARSS of Oregon agricultural college has made investigations as to many plant diseases, giving particular attention to spots, brown rots, and scabs of prunes, apples and peaches. His conclusions are that many plant and fruit diseases are not the result of bacteria or fungus activities, but may be due to physical condition induced by lack of moisture. We quote from that section of the article touching upon prunes as given in a number of the Oregon Grower, organ of the Oregon Growers Cooperative Association:

By H. P. Barss

Prune Diseases

We are very much concerned about the prune disease situation in some of our orchards. First is the brown rot. We always have that to be afraid of. The brown rot is a persistent disease—it is with us always—and one which is very difficult to combat because through the entire season from bloom period on to harvest, favorable weather conditions may bring about an epidemic of brown rot.

When I first studied the disease I thought it might be possible for us as prune growers to put on a certain definite program of sprays beginning in the spring and continuing on through the season, but I soon found that in a good many of our seasons a large proportion of those spray applications would be wasted, that is, would be practically useless, because weather conditions so often were unfavorable to the development of the brown rot that the disease would not make its appearance to any great extent. There was one application, however, which, applied to the prune trees, always gave benefit. That was an application given about a month before the harvesting of the fruit. It is against this most severe period of brown rot infection that we must protect our orchards if possible. In some years you will find the protection at the same time will do a great deal more good than it would in other years. That will depend on the severity of the epidemic, but in any case our experience is that a spray given in August as a protection for the fruit against picking time infections is well worth while. You may want to know what material would be best to employ. Lime-sulphur is not desirable because it has a tendency to cause burning of foliage and some injury at times to the fruit when applied during the summer season. I am speaking of the prune, but it applies equally well to apples, as you know there is much tendency to burning the fruit after an application of a sulphur spray on apples during the hot summer weather.

Prunes are even more susceptible. All stone fruits are more susceptible to the effects of lime-sulphur than apples, and our experimental tests show that this is true; therefore we advise the use of Bordeaux mixture. I would not use a strong mixture, not more than 3-3-50 or 4-4-50 strength, but I would aim in that application to get as thorough a coating on the surface of the fruit as possible, and in order to do that it is practically necessary to use a spreader, because ordinary Bordeaux won't stick to the waxy surface of the prune fruit very well and you will have simply a few spots of spray and leave spaces between which are favorable for infection of brown rot.

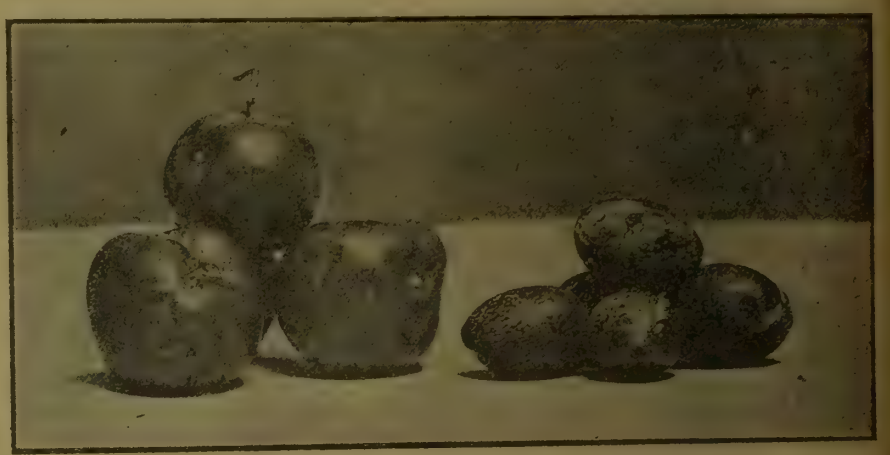
Brown Rot Develops

Now brown rot develops at the time nearly mature fruit is ripening and a good many fruits are dropping to the ground, where they are injured in dropping, and the brown rot gets into the cracks; also, when fruit is cracked by rains in the fall the brown rot may get a start there in the cracks in spite of spray, but even under those conditions this spray will prove of material advantage to the grower. A spreader should be used. I think casein would be the best material to use; soap would be desirable, and I had hoped that we might find an oil that could be used, but we tested an oil in Salem a few years ago. It produced the most beautiful spreading of the spray on the surface of the waxy fruit I have ever known but we found the spreader attacked the waxiness on the surface and caused a checking of the skin of the fruit, and my hopes of finding a good material for the use of prune growers were blasted at that time. But we have been trying out the use of casein and find that is nearly equal to the oil and has no tendency to produce the effect of checking on the skin of the fruit which I have mentioned.

Knock Out Brown Rot Clusters

It should be the effort, if there is help enough, for every prune grower to send somebody through the orchard at this time and later to knock out the clusters of brown rot fruit from the tops of the trees as far as they can be detected. You don't want the brown rot fruit hanging in your trees and producing millions of spores every day just where they can float down onto the other prunes in the tree. The only way to avoid that is

(Continued on Page 582.)



Troubles Which Are Not From Fungus

The apples at the left have drouth spots caused by lack of moisture, causing the leaves to absorb moisture from the fruit. The prunes at the right are attacked by "water-spot" or "gum-spot." These troubles, especially those pertaining to the prunes, are discussed by Prof. Barss in this week's issue. Engraving courtesy Oregon Grower.

They Have Selected Threaded Rubber

THREAD-RUBBER INSULATION

STORAGE BATTERY Willard

Why did the builders of 174 motor cars and trucks select Willard Batteries with Threaded Rubber Insulation as equipment on their product?

First— because many years of actual service on thousands of cars have proved that Threaded Rubber Insulation outlasts the battery plates.

Second—because they know that every piece of Threaded Rubber Insulation is exactly like every other piece.

Third— because they know that rubber is the most satisfactory insulating material, and that Threaded Rubber Insulation is the most practical form of rubber for starting and lighting batteries.

Pick out the dealer nearest you, listed below, and ask him to tell you why a Willard Threaded Rubber Battery on your car will save you money.

This trade-mark tells you that the plates in your battery are *insulated*—not merely *separated*. Willard Threaded Rubber Batteries are selected by the best brains in the automobile business as standard equipment for 174 makes of cars and trucks.

Walnut Association Building

GROUND was broken a few days ago for a $300,000 office building and by-product factory at Seventh and Mill Streets, Los Angeles, which will be occupied by the California Walnut Growers Association not later than September 1. The front of the building will be seven stories high, with basement; the back, three stories. It will be a Class A, reinforced concrete structure, fireproof throughout.

At the present plant in the Los Angeles Union Terminal it is necessary to handle culls from five to eight times before they are finally reduced to their ultimate by-products. In the new plant the nuts will be elevated to the seventh floor when they arrive, and from there they will travel by gravity down to the cracking room and to the sorting room on the third floor. They will then gravitate down to the salvage machines and packers on the second floor and finally go to the basement for storage until shipped. New and improved machinery for swift handling of products and reduction of overhead costs will be installed as soon as the new structure is ready for occupancy.

In commenting upon the necessity for such a building, C. Thorpe, general manager of the association, points out that the business of the associated growers is doubling every four years and that the percentage of the crop handled by the organization is growing steadily, being now beyond 81 per cent of the state's annual production.

He calls attention to the fact that in 1913 the association did a business amounting to $1,500,000 and that now its yearly business amounts approximately to $14,000,000. During the last eight years the organization has outgrown its quarters twice, and it now finds that quarters capable of encompassing its future development are an absolute necessity.

The building proposition was taken up more than a year ago. At that time the site was purchased for $45,000, but construction was postponed pending a drop in building costs. Mr. Thorpe is of the belief that the association saved at least $45,000 by waiting until this year to build and made considerable by purchasing the site before real estate values experienced a substantial appreciation.

It is expected that the new building will be in readiness to handle this year's crop. It is to be erected by the Walnut Growers Company, a subsidiary of the association, from which it will be leased by the association. According to the plan which has been evolved the association will be paying rent for the use of its new quarters but will practically own the establishment at the expiration of ten years. The total investment, which will run in the neighborhood of $300,000, Mr. Thorpe says, will represent only from two to three per cent of a normal year's walnut sales.

According to Secretary W. T. Webber, who is handling the financing of the new building, the Walnut Growers Company already has $50,000 worth of stock subscribed. A Los Angeles bank has agreed to loan it $150,000 on a first mortgage, leaving only $100,000 to be raised among the associated growers.

Grading and Packing Asparagus

By L. J. Weishaar

FRESH asparagus from the delta section is prepared for shipment and loaded at about half a dozen points, but Sacramento, Locke (near Walnut Grove) and Antioch are the most important.

At the beginning of the season and while market conditions continue favorable for the movement of the fresh green product, shipments are made daily, but as soon as prices decline to a point where distant markets assure no substantial profit, fields are quickly prepared so as to yield only the white fully blanched stalks for canning purposes. This is accomplished by hilling up the rows promptly.

When harvesting asparagus for shipment in fresh state the lug is used as field box. The gross weight of lugs evenly filled is 50 pounds and contains 40 pounds net weight of asparagus. Filled lugs are shipped by boat or hauled by truck to the packing house.

Stalks are sorted and graded by hand, no mechanical apparatus being in use in this section. In most packing houses four grades are made; occasionally an "extra fancy" grade is added, consisting of the very largest and most perfect stalks. Grading is done at long tables on which there is an arrangement of open shelf like compartments, stalks corresponding to the different grades being placed in the respective compartments, spear ends of stalks pointing one way. Diameter of stalk and its otherwise perfect appearance determine its grade. Stalks which are too thin, crooked, or otherwise defective to permit packing into regular grades are generally designated "culls" and are shipped loose in lugs to local markets. Only well graded, carefully packed stock is used for long distance shipment.

A patent buncher is used. Into this the stalks are carefully placed until it is filled. A clip at both ends of the buncher hold the bunch securely until it is tied with a ribbon about 1½ inches from each end. Butts are cut off evenly so that total length of bunch is 8½ inches. Bunches are then placed in shallow tray of water in order to freshen before packing. After a few minutes bunches are wrapped in a neatly branded paper and 12 bunches packed to the crate, floor of crate being bedded with a layer of moist moss. Crates are then nailed and ready for loading into cars

Pyramid Asparagus Crate

Parts: 2 heads, 9½ inches top width, 11 inches bottom width, 10⅜ inches high, 11/16 inch thick; 1 center, 9½ inches top width, 11 inches bottom width, 10⅜ inches high, 7/16 in thick; 2 top pieces, 3⅞ inches wide, ¼ inch thick, entire length of crate; 1 piece each side, 3 inches wide, ¼ inch thick, entire length of crate; 1 piece each side, 2 inches wide, ¼ inch thick, entire length of crate; 2 bottom pieces, each 5¾ inches wide, ¼ inch thick, entire length of crate; 4 d. cement coated nail used. Length of crate, 19½ inches.

Grading

Extra Fancy, 9-15 stalks per bunch.

stalks above 6/8 inch diameter; First Grade, 15-22 stalks per bunch, stalks approximately 6/8 inch diameter; Second Grade, 22-28 stalks per bunch, stalks approximately 5/8 inch diameter; Third Grade, 28-36 stalks per bunch, stalks approximately 4/8 inch diameter; Fourth Grade, 36 or more stalks per bunch, stalks approximately 3/8 inch diameter.

Bunches weigh approximately 2¼ pounds each. Crate of 12 bunches weighs net approximately 27-28 pounds. Crate of 12 bunches weighs gross approximately 33-34 pounds. Patent buncher has two clips. Diameter of buncher at butt end of bunch, 4¾ inches. Diameter of buncher at spear end of bunch, 4⅜ inches. PFE cars ordinarily load 608 crates asparagus: 2 layers high, 8 rows wide, 19 stacks, each layer stripped. Express cars ordinarily load 720 crates asparagus: 5 layers high, 8 rows wide, 18 stacks, each layer stripped.

TRAVELING SCHOOL FOR FIG GROWERS

A traveling school for fig growers as a part of the campaign of the California Peach and Fig Growers to produce in California the best fig grown anywhere in the world will be held during the week of May 16 to 21 inclusive, according to an announcement of association officers. The association writes: "This is the first time in the history of the fruit industry that this step has been taken by a cooperative organization and marks a milestone of progress in the growth of the idea that growers must back up their marketing organization with quality at the orchards.

"According to the announcement, the classes will be under the management of Professor Ira J. Condit, chief of the horticultural department. The plan calls for visits by grower classes to the orchards of the state where they will hear talks by practical growers and discussions of methods from planting down to the final operation of packing the fig for the market. The growers will travel about the state in a motor cavalcade and the itinerary of the first class calls for a week in the field.

"The move is in keeping with the campaign of the California Peach and Fig Growers to bring the quality of the California fig to the highest standard obtainable and through this standard establish the American fig as a quality leader in the markets of the world.

"The tentative schedule of the first class is as follows: Monday, May 16, Modesto-Ceres district; Tuesday, May 17, Merced district; Wednesday, May 18, Fresno district; Thursday, May 19, Clovis and Fresno district; Friday, May 20, Reedley and Dinuba district; Saturday, May 21, Sultana-Orosi district.

"All phases of fig culture will be discussed and demonstrated as far as the season permits in the classes. Special subjects such as picking and packing fresh figs, the Kadota fig and its possibilities, pruning, irrigation, caprifigs and caprification, fig diseases, soils and soil moisture, frost and frost injury, varieties, topworking, drying, preserving, canning and packing.

"Growers desiring to participate in the traveling class are requested to communicate with Professor Ira J. Condit, 304 Mattei Building, Fresno. No fees will be charged, the members of the association simply looking after their own expenses."

Yucaipa reports no frost damage to apples.

AVOCADO ANNUAL

The Cultivator recently gave detailed program of the annual of the avocado growers to be held at Pasadena, May 6-7. In outline, the program will begin Friday at 1:30 at the Hotel Maryland with an experience meeting. This will probably be of interest largely to the members of the association. That evening at 6:30 will be held the annual dinner; also at the Hotel Maryland. President Wm. H. Sallmon will be toastmaster. Presumably this dinner, especially the addresses, will be particularly "dry." All of the addresses scheduled in the regular program are by farm paper men. Saturday, beginning at 9:30 in the morning, will be given up to addresses by experts of the state university and the U. S. department of agriculture. Officers of the association are: President, Wm. H. Sallmon; vice-president, W. L. Hardin; treasurer, J. M. Elliott; secretary, R. Agnes McNally.

ECONOMIC STATUS OF CALIFORNIA BIRDS

(Continued from Page 577.)

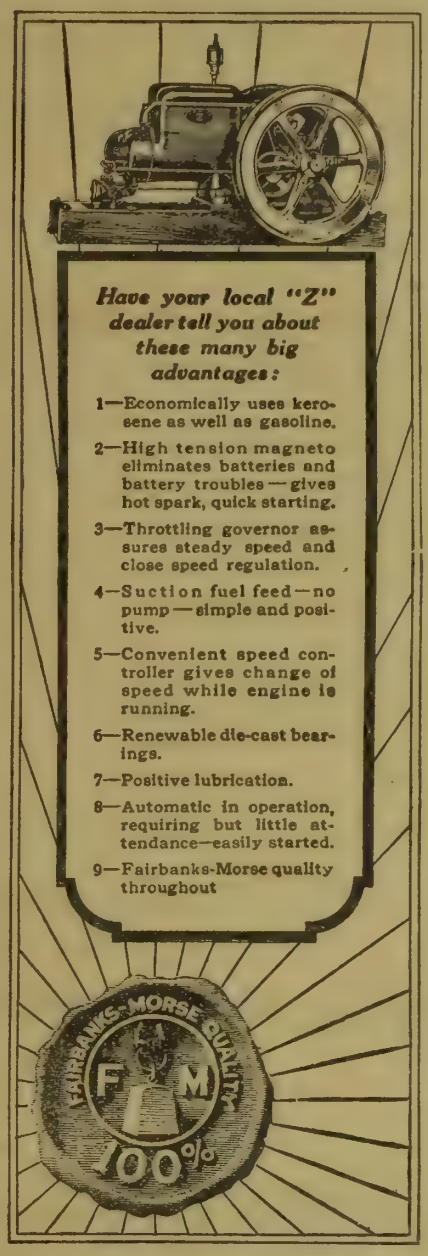
chards and fields, can save the remnant of our birds for the generations to follow.

Boys are presented by their parents with air guns and small rifles and allowed to make Saturday excursions into the country, shooting at will as their fancy dictates. Hundreds of unwanted cats are annually carried away in autos and dumped along our canals and country roads where they must either live on a diet of small birds or starve. Residents of many of the west side towns still take their toll of game birds out of season and of non-game birds at all seasons, while the pleasure bound Sunday auto parties which invade the hills and mountains each summer carry far too many rifles, pistols and shotguns at a season when the birds are nesting and have lost some of their fear of man. Who is going to plead the cause of our birds? Can our farm bureaus be induced to take up this work? It will be no easy task for prejudice is deeply rooted and ignorance and apathy are everywhere apparent.

As a cold dollars and cents proposition our farmers and fruit growers should familiarize themselves with the common birds of their fields and orchards and learn to distinguish between the beneficial and the injurious. Don't shoot the bird in your orchard when you find the center of the fruit bud eaten out. Give him the benefit of the doubt and begin to search for cutworms. All through the valley one may see the bodies of barn owls and red tailed hawks nailed to the ends of barns and garages, despite the fact that for a number of years the University of California annually sent out a train of exhibits through our counties and displayed, among other things, a graphic showing that each barn owl is literally worth its weight in gold on any farm. Thousands must have seen this but, apparently, it made no lasting impression. We cannot expect soon to reform the Sunday hunter who kills for the mere gratification of his lust for blood, but our orchardists, stockmen and farmers generally must put away their shotguns until such a time as they have learned to identify the beneficial birds about them. Nature, unassisted by man, maintains a very good balance in all things. Nature, handicapped by man's ignorant wastefulness, wages a losing battle but, with the cooperation of intelligent, thoughtful, unprejudiced men, can make this valley a garden such as no one has ever pictured.

It cost some of the Eastern states millions of dollars worth of crops annually before they learned to protect the birds. Shall California's present prosperity blind the eyes of our agriculturists until disaster threatens?

What One Gallon of Kerosene in a "Z" Engine Will Do for You



Have your local "Z" dealer tell you about these many big advantages:
1—Economically uses kerosene as well as gasoline.
2—High tension magneto eliminates batteries and battery troubles—gives hot spark, quick starting.
3—Throttling governor assures steady speed and close speed regulation.
4—Suction fuel feed—no pump—simple and positive.
5—Convenient speed controller gives change of speed while engine is running.
6—Renewable die-cast bearings.
7—Positive lubrication.
8—Automatic in operation, requiring but little attendance—easily started.
9—Fairbanks-Morse quality throughout
FAIRBANKS-MORSE QUALITY
F M
100%

Do you realize how much work the "Z" engine will do at the low cost of one gallon of kerosene?

It will pump 10,000 gallons of water for your stock, for your home, for fire protection.

It will light 10 20-watt, 16-candle power lamps for 15 hours from your light plant.

It will grind 40 bushels of feed to fatten your stock.

It will saw over 5 cords of wood for you.

It will run your churn—cream separator—milking machine.

It will operate your family washing machine—your grindstone, corn sheller, clover huller, shredder, hay baler and other machines about the farm.

Over 300,000 "Z" engines have been bought by farmers everywhere. They saved labor—got more work done. Over 6,000 dealers demonstrated the many big advantages of the "Z" to these farmers before they bought.

Note these features at the left and then you, too, go to your nearest "Z" dealer and see the "Z."

PRUNE DISEASES

(Continued from Page 578.)

to carry out similar measures as far as it is practical for you to do so, and the growers who have done this have found to their own satisfaction that it paid them. If possible those prunes should be removed, because if allowed to fall and get buried in the soil they will put up a crop of fruiting spores about 18 months afterwards and start brown rot another season in your orchard.

Destroy the Mummies

Of course it gets started anyway, but to allow a lot of these to get buried in the orchard is very bad policy. A lot of fruit that falls is attacked already, or becomes attacked after it has fallen on the ground. Growers who have a chance to put hogs in sufficient numbers into the orchard will have these brown rot prunes cleaned up and that gets rid of those brown rot mummies that eventually get buried and later on produce a new crop of spores.

Prune Gum Spot

Another kind of trouble is appearing in prune orchards and that is the prune gum spot. I call it "gum spot" because there is a spot there that pops open and from this spot gum exudes onto the surface of the prune. It looks a good deal like the injury that the insect known as curculio produces on prunes in the eastern part of the state, but it is not produced by an insect nor by any fungus and not produced by bacteria. The first thing that the orchardist notices is a rather bluish spot or water soaked spot just under the skin of the fruit. As a matter of fact, we find this water soaked appearance is due to the formation of a watery kind of gum which is produced in considerable quantities at a certain spot in the flesh of the fruit, and then it continues to be produced until the pressure is so great under the skin of the fruit that it bursts and the gum comes out onto the surface in this fashion. We have made careful study of the gum spot in previous years. It almost invariably appears in August or the latter part of July. Generally around the fifth of August we begin to get specimens sent to us for identification at the college. We have made microscopic examinations and have tried to discover by our technical methods whether there is a parasite present, and have never been able to find any parasite in connection with the spots. What we have found is a little tiny dead spot in the flesh of the fruit and it occurs at a time in the season when there is very great heat, usually, and very dry atmosphere. I do not know, and I think no one knows, the exact cause of the trouble, but it is associated with climatic conditions in some way. A certain combination of climatic conditions will probably produce this effect, but just what the combination is I do not know.

That is, I do not think anyone can predict from observing the weather just when an outbreak of this sort might be expected. I think that it is probable that the gum spot comes as a result of excessive evaporation from the leaves of the tree at a time when the soil has about as little moisture in it as it has at any time during the season, a time when the roots have a hard job to get enough water to push up to the tops of the trees to supply the tremendous demand for water which is caused by the high rate of evaporation from every leaf these hot, dry days. We know that each leaf is able to evaporate a certain amount of water from its surface. That goes on all the time. It sort of pulls moisture up from below and the water is carried out into the atmosphere by evaporation just as a damp rag held out in the air will gradually dry off—so a leaf is damp and it gradually dries, but there is a constant supply of water from the root system to make up for the evaporation.

When the day is unusually dry, and when the root system is not able during the heat of the day to give enough water to keep that leaf in perfect shape, it gets its water from the fruit.

California Experiments

In California we know by experiments that every day the oranges give up water to the orange tree foliage and every night there is enough water pumped up by the root system to make up for the loss, but it is differently constructed from a prune or apple, and they are likely to suffer. You will find little brown spots in the apple flesh sometimes and I believe it is a combination similar to this that brings about this gum spot in the prune. Where the apple is injured you don't get gum formation but you always get gum formation wherever a stone fruit is injured, so the gum is not especially indicative of the kind of disease. It isn't a symptom of a certain disease; it indicates some sort of injury in the flesh of that fruit.

The Remedy

The only thing that I can think of as a remedial measure for such things as this is to do what we can to keep as large and abundant supply of moisture in the soil as possible, keeping our root system in just as healthy condition as we can. We find some seasons there is very little and others there is a good deal of it. The fruit affected in this manner very frequently drops, but if it goes through to harvest and sometimes matures you can hardly tell that it has been affected by this condition. There is just a little slit in the skin that seems to have healed up and that is about the only evidence of this gum spot condition.

WHAT WILL THE 1921 HARVEST BE?

E. B. Beeton, Beaumont, Riverside County

I have thought best to give an amended report of the one sent you April 11 on the present condition of fruits at Beaumont. Protracted cold weather since April 3 has had a detrimental effect on some of the fruit setting. Summing up the situation at the present time, we believe the crop look to be as follows:

Apples are a fine prospect; undoubtedly will prove a full crop.

Almonds are unusually large, look good, and will justify a guess of 10 per cent normal.

Cherries have suffered most, especially Royal Ann.

It is hard to determine the loss as the frosted fruit is still on the tree mixed with the good fruit—probably 60 per cent of a normal crop.

Pears, 70 per cent of normal.

Apricots, 80 per cent of normal.

Peaches, 60 per cent of normal.

Prunes, 60 per cent of normal.

Grapes have been frosted but are not grown in commercial quantities here.

N. E. Mathews, Santa Ana, Orange County

Apricots: Growers at this time estimate about 40 per cent of normal crop.

E. W. Curtis, County Agent, Tehama County

With regard to the condition of the fruit crop in Tehama County would state that the frost of April 14 did considerable damage in some localities, though it was not general over Tehama County. The damage done was largely on Muir peaches, prunes and grapes. Muir peaches in the Red Bluff section were damaged perhaps 60 to 75 per cent, while Elberta peaches were damaged much less, perhaps only 30 per cent. Almonds and apricots escaped entirely, the reason for this being that the fruits were getting to be quite large and the trees well protected with heavy foliage. Prunes were damaged in the Bend section perhaps 20 per cent. Grapes all over the county were quite badly frosted and considerable damage was done wherever there were vineyards of any kind.

Prospects are very good for an exceedingly good crop of almonds, apricots, prunes and peaches with the exceptions noted above.

J. C. Metzgar, Secretary Santa Ana Chamber of Commerce, Santa Ana, Orange County

Almonds: Not grown commercially.

Apples: Promising condition.

Apricots: Probably 55 per cent normal. Late rain while in bloom caused damage.

Cherries: Not grown.

Peaches: Very few; no commercial orchards.

Pears: Very few; no commercial orchards.

Prunes: None except scattering trees.

Grapes: Not plentiful; what there is promises well.

No frost damage to any crops here whatever this year.

A MIGHTY THIN SLICE

(Continued from Cover Page.)

"The question which naturally arises is 'Why is such a small sum devoted to the development of our great basic industry?" One answer is that the farmers themselves have been very little interested in what was expended by the federal government for agriculture. Over $1,000,000 is spent in California by the federal department of agriculture each year, and there is scarcely a farmer who knows where as much as $50,000 of this sum is being expended. Some excellent work is being done in California by federal employes, but we know entirely too little about it. The work of some of these men is probably open to criticism that it has not been affiliated closely enough with the agricultural industries which it is supposed to be assisting; but it must also be granted that these industries in many cases have not been interested in the federal specialists who are working on their problems."

BERRY CONTAINERS

An announcement has been issued relative to berry containers, showing standards prescribed by superintendent of weights and measures and tolerances permitted as follows:

Strawberries, 12 ounces minimum contents (pint 33.6 cubic inches). Tolerance ¾ ounce in deficiency; 2 ounces in excess.

Loganberries and blackberries, 12 ounces minimum contents (pint 33.6 cubic inches). Tolerance ¾ ounce in deficiency; 2 ounces excess. Eight ounces minimum contents (½ pint 16.8 cubic inches). Tolerance ½ ounce deficiency, 1 ounce excess.

Raspberries, 8 ounces minimum contents (½ pint 16.8 cubic inches). Tolerance ½ ounce deficiency, 1 ounce excess.

The pint or 12 ounce basket is the standard container for strawberries while both the pint and ½ pint may be used for loganberries and blackberries

Raspberries must be marketed in ½ pint baskets.

CULTURE OF GLADIOLUS

It is time all gladiolus bulbs were in the ground. In the last issue of the Hawaiian Forester we find an instructive article on these plants by E. M. Ehrhorn, a former Californian, that fits the mainland culture so well that we quote from it:

"The culture of gladiolus in the garden is rather simple, for it thrives in all ordinary garden soils in sunny, airy locations. Deep, moist, sandy loam is the best. Stiff clayey soil should be avoided but can be used by filling in spaces with sandy loam or leaf mould. Liberal applications of well rotted manure should be dug in around the plants after they have made a good start. If a suitable bed for gladiolus can be prepared a month or so before planting the bulbs, so much the better, but the bed should be loosened up before planting.

"Bulbs should be planted from two to four inches deep, according to the condition of the soil; in light soils four inches deep, in heavy soils two inches deep, and from four to six inches apart. It takes from two to three months for the bulbs to flower, and those contemplating planting in groups or beds may plant the bulbs from eight to ten inches apart and then two weeks later new bulbs can be planted between the growing ones, thus prolonging the flowering period. If grown in rows they should be 12 inches apart. In dry weather the plants should be watered liberally, especially when the plants are developing their buds and flowers.

"After the plants have finished blooming and are ready to be taken up, great care should be exercised when removing the bulb not to lose the small bulblets, botanically known as cormels, as these, if taken care of, will soon produce flowering bulbs. These small bulblets can be placed in sand and kept for a few months and then planted in drills like peas in some good spots in the garden, where they will increase in size and flower in less than two years in our climate."

COMING EVENTS

May Day Picnic, Oakdale, April 30.
National Dairy Marketing Conference, under auspices of American Farm Bureau Federation, Chicago, May 3-4.
Floral Pageant, Woodland, May 4-6.
California Avocado Association, Pasadena, May 6-7.
Butte County Farm Bureau Annual Picnic, Paradise, May 14.
Fig School (traveling), May 16-21.
California Valencia Orange Show, Anaheim, May 17-22.
Rose Carnival, Portland, Oregon, June 8-10.
Citrus Institute, Whittier, between June 20 and 30.
Yuba County Agricultural Fair, Browns Valley, Aug. 29-31.
California State Fair, Sacramento, Sept. 3-11.
Southern California Fair, Riverside, Oct. 11-16.
California Association of Nurserymen Annual Convention, Exposition Park, Los Angeles, Oct. 20-22.
Date Festival, Coachella Valley, Oct. 21-23.
California Horse Breeders Association, Los Angeles, Oct. 30-Nov. 5.
Stanislaus County Poultrymen's Association Show, Winter Garden, Dec. 4-7.

Butte County farm bureau will hold its annual picnic at Paradise, May 14.

Gill
One-piece Piston Rings
prevent carbon

because: they keep oil down in the crank case and on the cylinder walls where it belongs. They don't permit it to get into the firing chamber. As a result the valves, spark plug, and walls of the combustion chamber are free from harmful carbon accumulation. And because they are cast individually from a special gray iron that resists the ravages of heat, Gill Piston Rings retain their elasticity and tension, and remain oil-proof indefinitely.

RUSSELL 1842--1921
THE OLD RELIABLE LINE

Get the Latest Improvements

It's the Grain You SAVE--- Not What You Raise, that Counts

Getting 99.9% of the Grain 408 Bushels per Hour

"A Russell Thresher owned by W. F. Kreimeier threshed 68 bu. oats in 10 minutes, dropping the straw on a canvas. The straw was then removed carefully and the residue of chaff run through a fanning mill and when all cleaned up to the last kernel, only 2 1-4 pounds oats were secured; the grain run through the Russell showed a loss of less than 1-8 of 1 percent. This is also a record for fast threshing, being at the rate of 4080 bushels per day of 10 hours." ---Editorial in Manhattan Messenger, Manhattan, Ill.

Salvaged 1125 Sacks Rice from Competitor's Straw Stack

"With my Russell 36x60 one day I threshed 1,765 sacks of rice in a field which yielded 17 sacks per acre; then re-threshed the straw and I obtained 3 sacks.
One job I re-threshed which was done by a (------) thresher.
"This separator threshed 8025 sacks of rice, and then the New Russell threshed the straw over again and obtained 1,125 sacks, so I feel that the New Russell thresher saves grain. $5 Would cover my season's repair bill."--S. V. JONES, Willows, California.

Late Russell Improvements include the big easy-running 15-bar Cylinder that works tooth-and-nail with the High Finger grate and gets most of the grain RIGHT THERE; and the patented Distributing Beater that spreads the straw evenly across the rack and gets out the very last grains.

No other thresher has these features—and none other can equal the Russell for saving and cleaning ALL THE GRAIN.

Russell Threshers are made in six sizes including the 20x34 for individual farm use, all alike in design. Russell Steam Traction Engines come in 5 sizes. Russell Kerosene Tractors in 4 sizes—a size for every farm. Send for catalog.

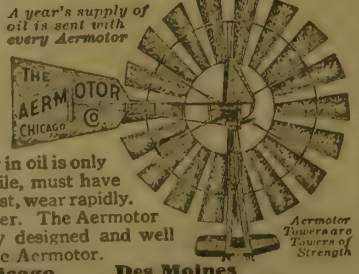
THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

A year's supply of oil is sent with every Aermotor



Aermotor Towers are Towers of Strength

Reconstruction Period in Salt River Valley

By M. E. Bemis

FARMERS were the last to get the benefit of higher prices incident to the general boost following the outbreak of the war and farmers were the first to feel the results of the general downward revision of prices.

Arizona farmers and particularly those in the Salt River Valley, representing probably 50 per cent of all in the state, have been no exception to the general class of farmers throughout the country. High prices for Long Staple cotton was the inducement for greatly increasing the acreage from 1916 to 1920 inclusive.

Shortly after the outbreak of the war in Europe there was little demand for cotton and the price dropped to 18 cents per pound. In 1915 it was found that Long Staple cotton could be used for the fabric of automobile tires and this at once boosted the price. By the early spring of 1917 farmers were enthusiastic over the outlook and buyers were offering to contract for around 30 cents a pound. Acreage and price increased up to planting time in the spring of 1920, when the price reached $1.25 per pound, and the acreage planted was 185,000 acres, or almost two-thirds of the entire area.

Land values, rents, labor and every item that enters into making a crop, advanced. The 1920 crop in consequence was the most expensive crop ever grown and when grown there was no market. Gin yards and warehouses are piled with cotton which less than a year ago was in world demand at fancy prices.

Banks have advanced as much as is safe, but farmers who have their capital tied up in cotton are needing money for making the 1921 crop. Many will plant alfalfa. The limiting factor in alfalfa acreage has been the impossibility of clearing the cotton fields in time for planting alfalfa. As it is, a good deal will be planted rather late. The grain acreage is considerably increased, but the same limiting factor applies to grain as to alfalfa. This will leave a considerable area to be filled in Sudan grass or other summer crops.

The dairy cows that were banished or butchered to make way for cotton are coming back. There is a determined effort on the part of bankers, the state dairy commission and the state experiment station to see to it that only first class cows are brought in, in other words, to re-establish the dairy industry and see that it is placed on a stable basis.

Land values have dropped somewhat, and even with pre-war prices for alfalfa hay and dairy products the careful farmer has an excellent chance to make good.

The jolt in farm product prices, the disappointment in cotton and consequent money losses are inducing farmers to play safe. The reconstruction period for farmers is a disillusionment. Dreams of sudden riches have vanished. It is hard, of course, for the farmer who has spread out, who has farmed 100 to 200 or more acres all in cotton, with teams and tractors and a small army of men, to come down to one or two men and farm 40 acres or even less.

"The big point now is that the big fellows are looking enviously at the small farmer who didn't have the nerve (or had too much sense) to sell off his cows and plunge in cotton. These small dairymen are the boys that have the money now. Some of them have a bale or two of cotton standing somewhere, waiting for a time when markets are stabilized. In the meantime these farmers are not worrying—or at any rate not as much as the other fellows whom they rather envied a year ago. Unfortunately, many who went in heavily for cotton last year are indicating that they will go just as far the other way this year and not plant a seed.

I have contended that Long Staple cotton would not drop as much relatively as other commodities. Short Staple cotton is now quoted at pre-war prices or less. There is no market for Long Staple that may be counted as establishing any real price, although some few bales may have been sold on a speculation basis.

Sea Island, of which there is but little, is quoted in Savannah at 40 cents. Egyptian Sakellaridis is quoted at 39 cents landed at New York or Boston, for Fully Good, and 32 cents for Good Fair. These are above pre-war prices, and almost certainly cannot go lower. If this view of the situation is correct we may expect to see the man that raises a little cotton, say 25 per cent of his acreage, as some dairymen have done this past year, making a good yield to the acre and a good profit.

We are coming now to a saner contemplation of the matter and may expect to see worked out a crop rotation system that will fit every farm. We may expect to see 40 acre farms the ideal acreage, with an orchard, garden, a few chickens, some live stock, dairy cows, hogs and beef cattle, alfalfa to be the principal crop and grain and grain sorghum to fit into a rotation in which cotton is the money crop. Such a system of farming will establish homes and build up communities because it will be a system that will be moderately profitable in good times as in bad. There will be no illusions to be broken, no disappointing market quotations, but a steady forging ahead, a more prosperous and more progressive community.

CASTOR BEAN CROP

An item of some interest to Californians, who during the war investigated the possibilities of profit in raising castor beans for oil, comes from Madras, India:

"The area under castor in 1920 is estimated at 350,000 acres, as compared with 454,000 acres estimated at the same date last year (December 24). The area actually recorded last year at the close of the season was 474,600 acres. The decrease is general but is heaviest in the Circars and Deccan, where the partial failure of the southwest monsoon prevented the usual area being sown. In the south a large initial decrease has to a certain extent been made up by late sowings. The crop has been badly affected by caterpillars in parts and generally by the irregular rains. The yield is therefore below normal and is estimated at 35,504 short tons for the whole presidency as against 50,17 tons in 1919."

Farm bureau organization continues in Arizona. Bureaus have been organized in Graham County at Safford, Thatcher, Central, Ashurst, Pima, Lebanon, Artesia and Glenbar.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Sow Bugs or Wood Lice

Can anyone tell me what to do for sour bugs? I have some plants in my garden that show them thick underneath the leaves, and some of my plants have withered and dried. Would appreciate very much if somebody could tell me of something that would kill the bugs but not the plant.—Subscriber, San Luis Obispo.

Presumably the soil is very moist and there may be decaying leaves and decaying wood around which attract these pests. They will attack living tissue, however. It is possible that raking and drying up the surface would control or scattering lime around. Another method of control is by making a mixture of sugar and Paris green and sprinkling on the ground. Thin slices of potatoes with Paris green sprinkled over are also effective in the control of this pest.

About the Reds

I would like to know the difference, if any, between a Duroc-Jersey hog and a red Duroc.—Subscriber, Ruth.

This is simply a difference of terms in referring to the one breed. They are all red hogs. Their perfectly proper name is Duroc-Jersey, but n these days of valuable time it has become very common to reduce to simply Duroc.

Thrips

I have a young prune orchard. There are numerous small insects which are found in the closely folded leaves of the tip ends of the new growth. These insects are about half the size of an aphis, have a long pointed body, and are a light yellowish gray color. Some which seem to be young are yellow and appear to have no wings. The others have wings which do not seem to assist them much in flying when there is no wind. When knocked onto a piece of cloth they are fast travelers on foot and occasionally stop and turn up their tails and ruffle their wings. They do not mind dry sulphur. They do not seem to hurt the vigorous growth but on some of the smaller shoots the small tips dry up and when touched drop off, leaving a clean tip which does not seem to start growing again. Would like to know the name of these insects and the best way or means of control.—Subscriber, Laton.

Plainly a case of thrips. The nicotine dust spray is considered as having many advantages for control of this pest. This is applied by either power blower or hand duster. The hand duster or knapsack type of machine has proven very effective. The dry process has proven especially effective with the nicotine and kaolin mixture. However, where one is fitted for the liquid spray use distillate emulsion 10 gallons and nicotine sulphate one pint, water to make 200 gallons.

Cottonseed Hulls for Goats

Will you please tell me if there is anything posonous to goats in the cottonseed hulls used for fertilizers. I find the goats are very fond of them.—Subscriber, Alta Loma.

No, we do not think that there is anything poisonous, neither anything exceptionally nutritious in cottonseed hulls. Henry's "Feeds and Feeding" says: "Cottonseed hulls, which contain somewhat less digestible nutrients than oat straw, are extensively employed in the South as roughage for cattle feeding. The hulls are low in crude protein, of which but a small part is digestible. With only .3 pound of digestible crude protein in 100 pounds the hulls have the extraordinarily wide nutritive value of 1:122, the widest of any common feeding stuff. Obviously they should be used with feeds which are rich in protein. Fed with cottonseed meal to steers by Willson at the Tennessee station, cottonseed hulls produced somewhat lower gains than corn silage, 100 pounds of hulls replacing 170 pounds of corn silage. Because of their low palatability and digestibility cottonseed hulls are not well suited to dairy cows, corn stover having a higher feeding value."

Twin Heifer Barren?

Regarding barrenness of heifers in case of twin bull and heifer Walter S. Chase of San Bernardino calls attention to Farmers Bulletin 1167, "Essentials of Animal Breeding" of the U. S. D. A., containing this statement: "The laws of the inheritance of fecundity are not all known, but to some extent it is dependent on inheritance from the mother; therefore, the selection of females which have a tendency to produce a large number of young at a birth will tend to increase the returns from the flock or herd. This is of practical importance in the case of hogs, sheep, goats and poultry. Twins in cattle are objectionable unless of the same sex. When a heifer is a twin with a bull calf, the heifer is known as a 'freemartin' and in the majority of instances is sterile." This statement also appears in another place in this issue of the Cultivator because of liberal quotations which we are making in the livestock department from the bulletin.

Killing Blue Gum Stumps

Take three or four buckets of boiling hot water and pour it on them slowly, so as to scald. For large stumps more is needed. Some stumps will die in a few days and others may take three or four weeks. If it does not kill, repeat. I have had good success killing blue gum stumps by this method.—Robt. Boehner, Olive.

Powdery Mildew

I would like to know the trouble with my rose bushes. The leaves curl up and drop off every year. They have plenty of water.—Subscriber, Vina.

The leaves show a bad attack of powdery mildew, common to some roses the world over. The popular cure-all for mildew is flowers of sulphur, but sulphur is not effective except under the most favorable circumstances. It is probably better to use a liquid spray of liver of sulphur (sulphide of potash), one ounce to three gallons of water, and spray under sides of leaves as well as from above. This solution does not hold its strength so a fresh mixture should be made for each application. In bad cases, while plants are still wet with spray, dusting sulphur on foliage would add to the effect if weather prove favorable to generation of sulphur fumes.

In addition it might be well to examine closely for aphis and if found, spray with nicotine mixture.

Strawberry Red Spot

I have received so much help from your paper that I thought perhaps you could help me out in my present trouble. Last February I set out 100 everbearing strawberry plants. They all lived and grew well for a while but lately the leaves are drying up and they die. I spread chicken manure over the bed before it was plowed. Have given the plants plenty of water

Also Exclusive Agent for North Whittier Heights

When Writing Advertisers Mention California Cultivator.

and cultivated them well.—Subscriber, Denair.

From above description this would appear to be "red spot" (a sphaerotheca). Small red spots appear thickly on leaves and continue to grow larger until practically all the surface is affected, when the leaves die. The remedy is spray of Bordeaux mixture, a 5:5:50 solution will do. If this does not eliminate the trouble, send in some leaves for determination of the cause of their death. In all such cases it is, however, a good precaution to spray at once with Bordeaux.

Avocados and Loquats

Can a seedling loquat tree about 25 years old be budded or grafted with success to an avocado? Which avocados are most hardy? If grafting to avocado would be undesirable what time of year could the loquat tree be grafted over to a larger kind of loquat?—Subscriber, Orange.

Avocados cannot be made to grow on loquats. The former belongs to the laurels, the latter to the rose family. The best time for topworking loquats is in the fall, about October, allowing buds to remain dormant until spring. Use same method of budding as in citrus trees. The buds will, of course, be somewhat larger than citrus buds. The Northrup, a small thin skinned variety of avocado, fruits well in parts of the San Joaquin and Sacramento Valleys. Of the larger type, the Fuerte, a hybrid, is the hardiest and in frosty sections is preferable to others. Wherever lemons escape injury it is safe to plant any variety of avocado now in the market.

Asparagus Culture

I have a number of asparagus plants now in the second year from seed. Should the tops be kept cut off or allowed to grow till the end of season (or fall)? Any information regarding the complete culture of asparagus will be gratefully received.—Subscriber, Orange.

It must be recognized in garden practice that growth is made and strength stored for next year's crop in all bulbous plants after the period of flowering. The plant food for this development is manufactured by the foliage. If you cut this away before ripening you starve the bulbs. Wait until tops begin to turn yellow and then cut them off on all bulbous plants whether asparagus, lilies, or daffodils. Burn asparagus tops; you may thereby prevent rust. Asparagus needs a deep, rich, thoroughly pulverized soil, preferably sandy and cool. Plant seed in beds or rows; cover about one inch. Keep watered and weeded first year, and if too thick in beds thin out to two or three inches apart, and you get better roots. After one year's growth they can be transplanted to rows three to four feet apart and one foot apart in the row. Although two year old plants are preferable for transplanting, they will then produce the following spring. Cultivation should be done early in the spring before the shoots start and in the fall after cutting is over.

Value of Manures

Please give me the relative fertilizing value of chicken, sheep, cow and horse manure.—Subscriber, Pasadena.

Poultry manure contains about 1 per cent of nitrogen, .8 per cent phosphoric acid and .4 per cent potash. (These figures are only approximate for analyses of various samples show a variation of from .75 per cent for fresh manure to 2.13 per cent for air dried.) Sheep manure contains about .9 per cent nitrogen, .5 per cent phosphoric acid, .45 per cent potash. Cow manure where solid and liquid are mixed contains about .6 per cent nitrogen, .15 per cent phosphoric acid, .45 per cent potash. Horse manure where solid and liquid are mixed contains about .7 per cent nitrogen, .25 per cent phosphoric acid, .55 per cent potash. The above figures as to the manures are percentages of plant food constituents in fresh excrements and are only approximate, for methods of feeding and of preserving the manure vary greatly.

CASH ONLY

"Marse Henry" Watterson said at a Louisville dinner:

"One day I met an old negro toting a fine ham under his arm. It was a gray, cold day, windy and threatening snow, but the old fellow had on a ragged seersucker coat and seersucker trousers—you could see his black skin through the holes.

"'Ephriam,' I said, 'why did you spend your money for that magnificent ham? You'd have done better to buy an overcoat.'

"Old Eph rolled his eyes at me and said solemnly:

"'Marse Henry, when Ah axes mah back fo' credit Ah gets it, but when Ah speaks to dis'—and he gave his stomach three or foor whacks with the ham—'it calls fo' de cash.'"—Washington Star.

California Wonder Corn

Now is the time to plant California Wonder Corn — the best and biggest yielding corn ever introduced. Bears 3 to 12 good ears per stalk. Best plots at my seed farm have averaged 6 ears per stalk—over 300 bushels per acre. I am now selling seed from this same stock direct to you with full printed cultural directions telling just how to plant and care for it. It only costs five dollars per acre, postage paid to your door, to seed to this big money making crop. Invest five dollars or more in California Wonder Corn and watch it grow into thousands. You can do it. Big, sure and quick profits are yours this year if you act promptly.

Send for my free photo illustrated booklet showing many individual stalks and field scenes—tells all about it and gives prices on shelled corn, corn on the ear and stalks with the ears all on them. Better still send in $5 for each acre you want to plant and receive your seed by return mail.

Plant them according to directions and begin now to turn your dreams of big profits into Real Dollars—You Can—It's up to you to act. Send in that order right now before you forget it and big profits will be yours at harvest time.

WHEN THE BABY'S SICK

Say! Y' know our baby?
Well! he's sick t'day,
An' yisterday the doctor
Jes' couldn't stay away.
He come three times a-runnin',
An' runnin' good an' quick,
Fer Pa won't stand fer foolin'
W'en the baby's sick!

Ma she's jes' a-jumpin'
Fixin' up the bed,
An' tellin' all the neighbors
What the doctor said;
Pa can't read his paper,
Ner go t' work, ner joke,
Jes' waiitn' on the baby,
An' tryin' not t' choke.

Sis she does the cookin',
An' bein' awful nice,
An' she's been a-cryin',
Fer I seen her twice!
"Looks like I been cryin'?"
Say! Y're not s' slick!
You ain't got no baby,
An' our baby's sick!—C. I. J.

TAKE CARE OF YOUR SHOES AND SAVE MONEY

DO not discard shoes as soon as they begin to show signs of wear. Proper care means a reduction in shoe bills of from 25 to 50 per cent, and at the same time insures good looking footwear. Keep your shoes in repair, and wear them as long as they are serviceable. An economical plan is to have two pairs which are worn on alternate days, thus permitting each pair to become thoroughly dry between the periods of wearing them. Shoe trees are of great assistance in retaining the original shape of the shoe. Shoes designed for heavy out of door work should be kept clean and greased, while those for street wear should be kept clean and polished.

Send your boots or shoes to the shoemaker for repairs the minute they begin to rip at the seams, the upper leather cracks through at a crease, a heel becomes twisted out of shape, or the heel lift wears through. Especially avoid wearing away the welt. Any delay may mean that the shoe soon will be so badly damaged that it is no longer worth repairing, and from $2 to $5 has been lost by neglect.

Ripped seams in the uppers can frequently be stitched at home, and a handy man, with the aid of a repair kit, can put on new heel lifts, rubber heels, half soles and metal heel or toe plates without much difficulty. The equipment necessary for repairing shoes includes a last holder, three or four iron lasts of different sizes, a shoemaker's hammer, a pair of pincers, one or two leather knives, a leather rasp or file, awls, nails for soles and heels, flax shoe thread, bristles and wax. Made up repair kits, containing all the necessary articles, or the separate articles, can be purchased from dealers in hardware or shoe findings. Waxed linen or flax thread should always be used for sewing, the flax being stronger and more durable than cotton, and the wax making the thread more water resistant and the stitch holes more impervious to water.

Drying

Boots and shoes are peculiarly subject to damage after they have become soaking wet. The wet leather is soft and therefore readily stretches out of shape. The stitches cut through the wet leather much more easily than through dry leather, and wet soles and heels wear away rapidly.

Great care must be taken in drying wet boots and shoes, for they often burn before it seems possible. Moreover, if dried too fast and without proper attention, they shrink, becoming hard and misshapen.

To dry wet boots and shoes properly, first wash off all adhering mud and grit with tepid water, and, in the case of work or rough shoes, at once oil or grease them. Then straighten the counter, heel, vamp, and top to the proper shape and stuff the toes with crumpled paper, which helps them to hold their shape and shortens the drying period. Finally, set the shoes aside in a place that is not too warm and allow them to dry slowly. Wet leather burns very easily, much more readily than dry leather. If it bear, it is almost sure to burn. The shoes should not be worn until they becomes hotter than the hand can have become thoroughly dry.

Oiling and Greasing

The rational use of the proper kind of oil or grease will greatly increase the wear of shoe leather. Boots and shoes, especially those worn on the farm, should be oiled or greased whenever the leather begins to harden or dry, or when it does not turn water well. The purpose of doing this is to make the boots last longer, and to keep the feet dry and comfortable.

Before oiling or greasing, brush the boots or shoes thoroughly to remove all the dirt and dust, warm them carefully, bearing in mind the danger of burning them if they are wet, and apply warm oil or grease with a swab of wool or flannel. The oil or grease should never be hotter than the hand can bear, and it should be rubbed well into the leather, preferably with the palm of the hand. Special care should be taken to work the grease in well where the sole is fastened to the upper, as the water soaks in most frequently at that place. After being greased the shoes should be left to dry in a warm, but not hot, place.

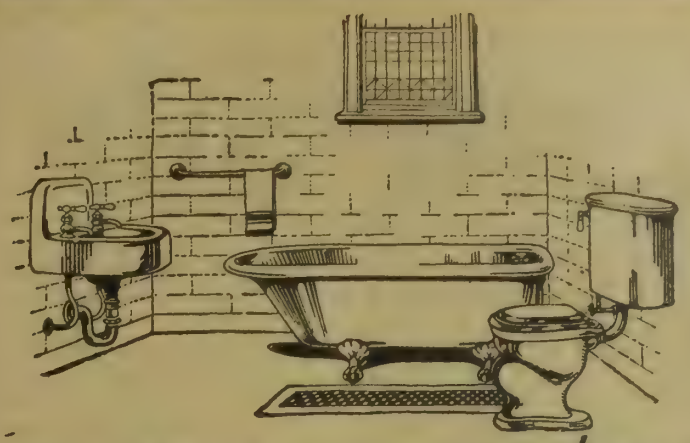
Among the best oils and greases for this purpose are neatsfoot, cod and castor oils, tallow, and wool grease, or mixtures of them. Cylinder oil and vaseline or petrolatum also are good, but are improved by being mixed with animal oils or greases. The application of any oil or grease darkens light colored or russet leather. Where this is objectionable the shoes should be kept in good condition by frequent polishing.

Castor oil probably is the most satisfactory oil for use on shoes that are to be polished. Apply the oil lightly to the clean, dry shoe, and rub it into the leather until dry. If the application is light the shoe may be polished immediately, although it is better to wait until the next morning. If the oil is applied too heavily it will be difficult to polsh the shoes satisfactorily even after two or three trials.

Waterproofing

It is often desirable, especially at certain seasons of the year, to grease boots and shoes heavily to make them water resistant, since it is highly important both for health and for effective work to keep the feet warm and dry. The ideal shoe would permit the perspiration from the foot to pass out, at the same preventing the entrance of water. Such a shoe, however, does not exist.

Dependence for keeping the feet dry must, then, be placed on rubber overshoes and boots or waterproofed leather shoes and boots. Although rubber overshoes and boots will keep water out, they also keep the perspiration in. Moreover, they are cold in winter and hot in summer. For these reasons, as well as because of exces-



This Bathroom Set $90
~absolutely Perfect Grade "A" fixtures, complete to Rough Plumbing

THE bathroom set you want for your home. Everything you need for a modern, sanitary bathroom. You may have a 4, 4½ or 5 ft. cast iron, white porcelain enamelled bath tub, whichever size you prefer. Low style of white toilet, with birch mahogany seat; wide apron lavatory—all as shown in picture.

Bath and lavatory (washbowl) are equipped for hot and cold water, with high quality nickel plated brass fittings.

Fixtures and fittings are fully guaranteed perfect goods. Everything complete to the rough plumbing.

FREE If you enclose this advertisement, or mention the California Cultivator, when ordering, we will include a handsome white enamel towel bar and a white enamelled holder for toilet paper FREE. Shipping weight of this set, 550 pounds, second-class freight.
We guarantee this set fully—it is absolutely perfect Grade "A" ware.

Plant Winter Rhubarb

FOR PROFIT

Growers netted this year $1000 per acre. April, May and June are absolutely the best months to plant for full crop next winter and spring. We can supply plants—all sorts for large fields. Write for price list. J. B. WAGNER

Rhubarb and Berry Specialist, Pasadena, Cal.

sive weight, rubber footwear is objectionable to many people.

Some boots which are well made of best quality leather and which are properly treated are practically waterproof under most conditions of wear. Nearly all of the leather shoes and boots made nowadays, however, when treated to make them water resistant, allow the entrance of some water, owing principally to the difficulty of completely waterproofing the seams. Such footwear cannot be expected to keep the feet perfectly dry if worn for a long time in wet weather, nor will it take the place of rubber overshoes or boots for walking in water, slushy snow or very soft mud.

Waterproofed leather boots and shoes are very satisfactory, however, for protecting the feet during rain or snowstorms and for use on wet pavements or wet ground where there are no deep puddles. They also keep the perspiration in, but are not as objectionable as rubber in this respect.

In summer the grease used for waterproofing shoes and boots should be harder than that used in winter. Since heavily greased shoes have a tentency to cause the feet to perspire and swell in hot weather, and there is also less need for water resistant shoes in summer than in winter and spring, it is rarely advisable to put as much grease on the shoes at that time of the year. In summer the quantity of grease used should not exceed the amount that the leather will take up without leaving its surface greasy. In winter, especially if it is desired to secure the maximum water resistance, a mixture of grease and oils which is not too hard when cold is required, while more of this grease than the leather will absorb may be used. An excess will do no harm and will make the leather more water resistant.

Waterproofing Formulas

For waterproo,ng boots and shoes, here are some simple formulas given by the department of agriculture.

Formula 1—Neutral wool grease, 8 ounces; dark petrolatum, 4 ounces; paraffin wax, 4 ounces.

Formula 2—Petrolatum, 1 pound; beeswax, 2 ounces.

Formula 3—Petrolatum, 8 ounces; paraffin wax, 4 ounces; wool grease, 4 ounces; crude turpentine gum (gum thus), 2 ounces.

Formula 4—Tallow, 12 ounces; cod oil, 4 ounces.

In each case the ingredients of the mixture should be melted together by warning them carefully and stirring thoroughly. Better penetration is obtained if the grease is applied warm, but it should never be hotter than the hand can bear.

Grease thoroughly the edge of the sole and the welt, as this is where shoes leak most. The sole should also be thoroughly impregnated with the grease, thereby increasing its water resistance, durability and pliabilty. The sole can be most convenently waterproofed by letting the shoe stand for about 15 minutes in a shallow pan containing enough of the melted waterproofing material to cover the entire sole. Rubber heels, however, should not be allowed to stand in the grease, as it softens the rubber.

HIS PREFERENCE

"On a day like this, melodious with the songs of birds and odorous with the sweet smells of springtime," rhapsodically spoke J. Fuller Gloom, "I hear the call of the land as at no other season of the year, and feel that I should like to be a farmer—preferably a retired farmer."

HINTS FROM HOUSEKEEPERS

Can Dried Fruit

Whenever I cook dried prunes, peaches or apricots I prepare sufficient quantity so there will be three or four cans to put up in addition to all we will eat. These are very convenient to have on hand for immediate use, especially at this time of the year when my fruit shelves are thinning out. Besides one is apt to prepare rather more of the dried fruit than the family really relishes at one time and perfectly delicious stewed prunes by oft appearing on the table come to be considered something of a joke or even distasteful. By canning up the surplus the family's prune appetite is never surfeited and the rich, spicy, fragrant fruit is appreciated as it deserves. — Housekeeper, Los Angeles.

Sugar Pie

I saw an inquiry regarding sugar pie in one of the papers a week or two ago so I thought I would send my recipe. Line pan with paste, then sprinkle over it one tablespoon of flour, ½ cup sugar, ½ cup of milk, dot with butter, sprinkle with cinnamon and bake in a moderate oven.—Mrs. C. A. Willis, Lodi.

Calla Lily Stains

The subscriber from Riverside desiring to remove calla lily stains could try Clorox (purchased at a grocery). The writer has found it most helpful, in fact wonderful.—Another Subscriber.

GIRL CANNERS MAKE MONEY

A girls' canning club in Arkansas started a contest to determine which of the members could produce the most tomatoes at the least expense, and with the lowest percentage of waste. Annet Sargo, on the Mount Valley route, near Hot Springs, grew 3,140 pounds of tomatoes on one-tenth of an acre at a cost of $31.40 and net returns of $109. With the same expense her sister, Fannie, grew 3,020 pounds and had a net return of $107.89. Ada Rosamond grew 2,803 pounds, costing $27.42, with a net return of $76.66, and Ruby Waddell at Bonnerville had 3,070 pounds, costing $29.91, with net returns of $68.

JELLY MAKING

In the household department of the issue of March 26 an inquirer, A. B. of Orange, asked why her loquat and crabapple jelly turned to sugar, and in the partial answer given at that time we promised to reprint from a University of California leaflet directions for successful jelly making, explaining method of determining amount of pectin present in the fruit juices and amount of sugar required. The directions follow. They are taken from "Fruit Juices and Jellies," published in August, 1917, by the Agricultural Experiment Station of the University of California at Berkeley, and written by W. V. Cruess, author of "Home and Farm Food Preservation."

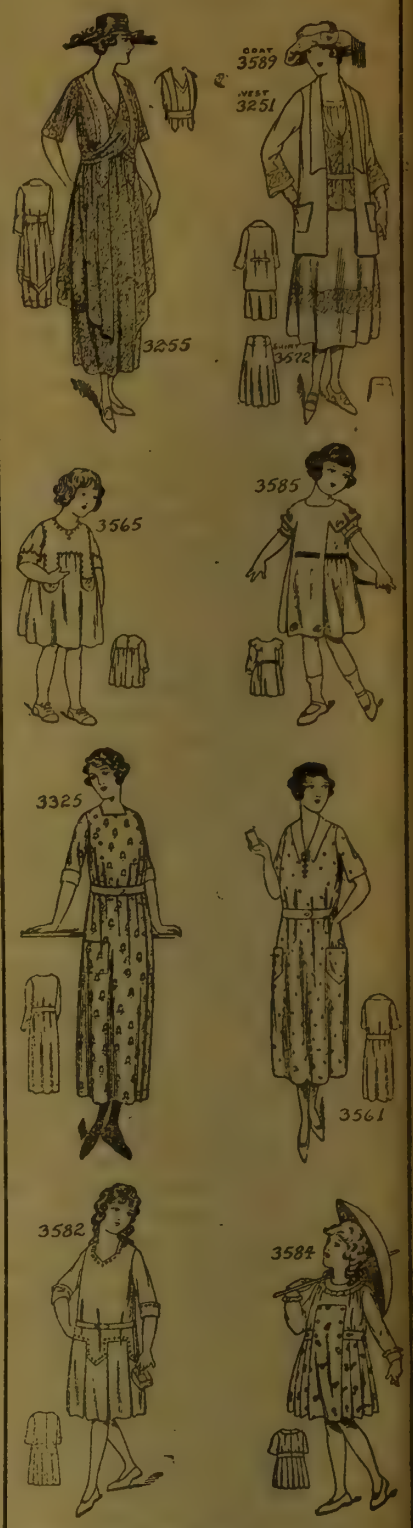
Boiling Fruit

Boil the fruit until tender (cut and sliced if hard) with just enough water to prevent scorching. Strain off the juice and press the pulp in a coarse bag. Keep the pressed juice separate.

Clearing Juice

Filter through a jelly bag. The pulp from red currants and sometimes crab apples and loganberries contains an excess of pectin and can be reboiled with a little water, strained and

The Cultivator Patterns



3255 A charming Gown—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 7⅛ yards of 40 inch material. The width of the skirt at lower edge is 1⅞ yard. Price 10 cents.

3565. Child's Dress—Cut in 4 sizes: 2, 4, 6 and 8 years. Size 4 wil require 3 yards of 27 inch material. Price 10 cents.

3325. Ladies House Dress—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6 yards of 36 inch material. The dress is of comfortable width at the foot. Price 10 cents.

3582. Girl's Dress—Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size will require 4 yards of 36 inch material. Price 10 cents.

3589-3251-3572. A Smart Suit—Coat 3589 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Vest 3251 cut in 4 sizes: small, medium, large, and extra large. Skirt 3572 cut in 6 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make this suit for a medium size will require 7¾ yards of 40 inch material for coat and skirt, and 2 yards of 27 inch material for the vest. The width of the skirt at the foot is 2¾ yards. Three separate patterns 10 cents for each pattern.

3585. Girl's Dress—Cut in 4 sizes: 4, 6, 8 and 10 years. An 8 year size will require 3⅛ yards of 36 inch material. Price 10 cents.

3561. Ladies' "Apron Dress—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A medium size will require 5½ yards of 27 inch material. Price 10 cents.

3584. Girl's Dress—Cut in 4 sizes: 4, 6, 8 and 10 years. An 8 year size will riquire 1¾ yard of 24 inch material for the waist and 2¾ yards for the skirt. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

mixed with the first juice. It will have less flavor and acid.

Testing for Pectin

To a teaspoonful of juice add an equal quantity of 95 per cent alcohol. Mix and allow to stand. It should form a thin jelly. If it does not, add some crabapple juice or other juice rich in pectin until a good test can be obtained.

Test Acidity

Compare the taste of the juice with a lemonade made of one teaspoonful of lemon juice with nine teaspoons of water. If less acid add lemon juice or other sour fruit juice.

Addition of Sugar

Add a cupful of sugar to each cupful of juice and boil down until the Baume tester shows 30 degrees or a thermometer in the boiling juice shows 220 degrees Fahrenheit, or until it will thicken quickly on a cold spoon. If the fruit is poor in pectin use only from one-half to three-fourths of a cup of sugar to each cup of juice.

Sealing

Pour into jelly glasses with care not to wet the glass above the jelly. When set, cover with hot melted paraffin. Exposure to the sun before covering will assist jellying.

JELLY JUICE, A NEW PRODUCT OF UNIVERSITY INVESTIGATION

Experiments carried out by Professor W. V. Cruess of the University of California during the last five years are declared to have shown that all jelly fruits may be preserved in liquid form indefinitely in cans or jars for jelly making. This fact is said to make the foundation of a new fruit product industry possible.

The "jelly juice" is said to be very convenient for use in the kitchen. "All that the housewife needs do is to open the can, empty the jelly juice into a pot, add an equal volume of sugar, boil a short time, and pour into glasses. The jelly is ready to use as soon as it has been allowed to cool overnight."

USE LESS SUGAR IN JELLIES AND JAMS

One-fifth to one-quarter less sugar can be used in making jelly and jams, experiments made by household experts in the United States department of agriculture experimental kitchen indicate.

Another sugar saving wrinkle tested by the experiment kitchen is to add one-quarter teaspoon of salt to each cup of fruit juice for jelly or pulp for jam, marmalade and conserve. In the case of non-acid fruit this makes the absence of the full amount of sugar less noticeable. The salty taste will disappear after the product has stood for a few weeks, but the flavor will be much the richer for the addition of the salt. Salt was so used in England during the war, and the method suggested was based on reports of the process.

With fruits of pronounced flavor, or where lemon and orange peel or spices are used for flavoring those with mild flavor, various syrups take the place of part of the granulated sugar. Usually half and half is the proportion used in substitution.

The seagulls of San Francisco Bay have such a broad taste that it is necessary to fasten the windows of the ferry building with strips of metal instead of putty, the last named commodity proving an irresistible delicacy to these sea fowl.—Southern Pacific News.

NEW PRUNE RECIPES

These come from Oregon, home of the "Mistland" prune grown and packed by the Oregon Growers Co-operative Association:

Prune Soup

Place 1 pound prunes, 1 stick cinnamon and rind from 2 lemons in boiling water; let stand over night. Boil until thoroughly cooked the next morning. Strain and mix with soup stock to cream. Make butter and flour mixture and add to soup in small quantities 1 cup of cream, stirring meanwhile. To season, add desired amount of salt and pepper.

Prune Puff

Place two cups of cooked prunes in a buttered baking dish. Pour over them a batter made from 3 cups flour, 3 teaspoons baking powder, ½ teaspoon salt, 2 of melted butter, a cup of milk and 2 beaten eggs. Bake until the crust is light and brown and a straw comes out clean. To be served with butter and egg sauce, as follows: One-half cup butter creamed with one of sugar. Set in bowl over a kettle and whip in the white of one egg until foamy.

Prune Luncheon

Puree of Prunes
Crisp Celery Ripe Olives
Sugar Cured Ham, Prune Sauce
Prune Sweet Potato, Southern Style
Tea Biscuits
Prune Salad Imperial
Prune Mince Meat Pie
Coffee

Prune Cake

1 cup sugar, ½ cup shortening, 2 eggs, 1 cup milk, 2 cups flour, 2 teaspoons soda, 1 teaspoon cinnamon, 1 teaspoon nutmeg, 1 cup cooked prunes.

Filling.—About 1 cup prunes, 1½ tablespoons cornstarch, ½ tablespoon lemon juice, ½ cup sugar.

Iceing.—1 cup prune juice, 1½ cup sugar, 1 teaspoon cinnamon.

HOUSEHOLD HINTS

To give window glass and mirrors an extra shine after washing them, rub a little thin cold starch over the surface, let dry and then rub off with soft cloth.

To prevent machine stitching from drawing after a garment is washed, soak the thread in a glass of water over night and let dry before using.

To preserve the color of a print dress, wash in warm soapsuds with a tablespoon each of powdered borax and comon salt added to the suds and put this also in the warm rinsing water. Wring tightly and roll up in a coarse towel until dry enough to iron.

When thin dresses need freshening, put a tablespoon of borax powder in a small bowl of water and dampen the entire dress with this, then press on the wrong side with a hot iron. To give thin white waists and all sheer materials just the right degree of stiffness, wash and dry without stareching. Put a tablespoon of starch and one of borax into a gallon of water. When dissolved, starch garments in this and roll tight until ready to iron. They will not be stiff, but just like new.

To remove ink stains and peach stains that have dried in the cloth, use peroxide of hydrogen. As soon as it is dry from one application, put on more until the stain disappears, then rinse out at once in clear water. Molasses rubbed on grass stains will often remove them, but for fine goods it is better to rub the stains with lard and then with alcohol camphor before washing.—A. M. H.

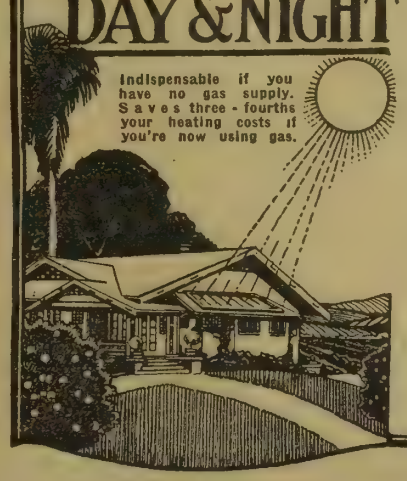
Let the SUN give you plenty of HOT WATER

DAY & NIGHT



SEEMS impossible, doesn't it? But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home — mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

Thousands Picnic at the University Farm

By R. P. Royce

THE well defined superstition that 23 is an unlucky number failed to impress the students of the university farm school and the college of agriculture in making their plans for the annual farm school picnic which was held at Davis, Saturday, April 23, for those embryonic farmers organized and staged an event that was a revelation to many visitors and a distinct credit to the student body.

Those who had attended former picnics found not many marked departures from the plans followed in past years. Even the weather was slightly different—if at all, the famous north wind was a trifle stiffer and a wee bit sharper. But the crowd, estimated at nearly 10,000, didn't seem to mind and laughed at any discomfort and proceeded to enjoy themselves and to take advantage of the occasion to become better acquainted with the institution and the things it has to offer the agricultural industry of this state. And that, after all, is the main purpose back of this annual affair.

Throughout the varied program that started at eight o'clock and lasted until midnight there was a distinct effort made to stress those features of the activities of the institution that could be turned to profit by the visitors.

Each deparment was on dress parade, so to speak, and had arranged a comprehensive exposition of the work being carried on. Instructors and assistants were on hand to explain the exhibits, to answer questions and to dispense, to the best of their ability, such information as was sought.

The principal event of the morning was the annual livestock judging contest. Twenty students who had qualified in the preliminary contests entered the finals. Each student was required to place one class of horses, beef cattle, dairy cattle, sheep and swine, and to give their reasons before the judges of the contest. The contest held the center of interest during the morning and the following results were announced:

Champion judge.—California Cultivator trophy, B. H. Thomas, Oakland; second, L. A. Sagehorn, California Breeders Sales and Pedigree Company trophy.

Best judge of horses.—A. H. Powers, Santa Anita Rancho trophy.

Best judge of beef cattle.—R. C. Rathbone, California Cattlemen's trophy.

Best judge of dairy cattle—N. D. Hudson, California Dairy Council trophy.

Best judge of sheep.—B. H. Thomas, American Southdown Sheep Breeders Association trophy.

Best judge of swine.—R. E. Rider, California Swine Breeders Association trophy.

Following the judging contest there was held a fitting contest. This contest was arranged to promote interest in the fitting and showing of livestock. The contest was judged on the degree of improvement made by the contestants during the time they had been working with their entries. The awards follow:

Horses.—1, L. C. Jones; 2, J. B. Woodford; 3, F. B. Alexander. The three prizes were donated by the Horse Association of America.

Hereford cattle.—1, S. H. Iuenbeck; 2, G. V. Steed; 3, T. W. Ralston. The three prizes were donated by the Pacific Coast Hereford Cattle Breeders Association.

Shorthorn cattle.—1, T. J. Compton; 2, C. E. Tegner; 3, E. R. Smith. The California Shorthorn Breeders Association contributed the three prizes.

Jersey cattle.—1, M. D. Wood; 2, R. D. Moore; 3, R. Tuttle. The Jersey prizes came from the California Jersey Breeders Association.

Holstein cattle.—B. H. Thomas, C. M. Wyatt and L. A. Pellissier were the winners of the three prizes from the California Holstein Breeders Association.

L. C. Jones won the Elkhorn Farm trophy for Ayrshires. N. G. Sheesley won the trophy offered by the dairy cattle herdsmen for the Guernsey fitting. G. C. Wood was awarded the trophy offered for the best fitted Angus that was offered by the beef cattle herdsmen. S. M. Gilbert was first in the Hampshire sheep contest and won the cup given by Calla Grove Farm. Charles Bender and K. C. Hardy were second and third. I. W. Beck was the Shropshire winner and F. E. Corwin and R. W. Guilford were second and third.

In the swine fitting contest W. R. Benedict was first in the Poland China class and W. Curl and C. C. Rider were second and third. All received prizes from the California Poland China Breeders Association. The three trophies offered by the Western Berkshire Congress were won by N. D. Hudson, F. E. Needham and C. H. Spurlock. O. L. Aldrich, H. E. Porter and C. Cordon won the awards offered by the California Duroc-Jersey Breeders Association.

During the noon hour the visitors spread their lunches picnic style under the campus trees. The management served free coffee to all.

Immediately after lunch the main feature of the day, the parade, held the center of the stage. The improvement of this year's parade over former years was quite marked, more originality and artistic effort being displayed. Headed by a magnificent four horse hitch drawing the animal husbandry float, each division was represented along with many special floats entered by the students. A regrettable feature marred the full spectacular value of the parade. Through some oversight scarcely any of the horses or cattle were permitted to participate. The animal husbandry float was declared the most artistic, the agricultural engineering entry the most original and the entomology float the most educational.

The parade over, the crowds were free to entertain themselves or to be entertained. All divisions were open, so, too, the barns. In addition to the above there was a circus, side shows, athletic events and many other features that helped to make the day one of pleasure and profit.

For those who remained for the evening ample opportunity was provided for dancing and other amusements.

Mayhap the writer drew too heavily on his imagination, but it seemed that there was a new note about this annual event this year that could hardly be missed. It seemed that a new atmosphere was about the campus—an atmosphere of hope and assurance that the future holds great things in store for the institution. Members

of the faculty appeared to feel that a new order of things was about to be established; that many of the things the institution has so sorely needed were about to be supplied by an awakened administration. The students appeared to enter into the spirit of the event with new enthusiasm and the visitors were free in expressing their determination that California must have an institution of agricultural instruction and research the equal of any in the United States.

FARM SCHOOL ALUMNI MEET

One of the largest gatherings of former students of the university farm attended the annual banquet and meeting of the University Farm Alumni Association, which was held at the farm dining hall, Friday evening, April 22. Besides the members of the alumni association were many members of the farm and college of agriculture faculties, including Prof. E. C. Voorhies, Prof. J. E. Dougherty, Prof. C. M. Titus and John Jacobson.

Following the banquet the annual meeting and election of officers was held. Prof. Voorhies discussed the new plan of courses to be offered by the university, which is to require that the first two years of agricultural work be carried on at the university farm and the remaining two years at Berkeley. Considerable time was given over to the discussion of the future policy of the association relative to changes at the farm and various farmers problems.

The officers elected for the ensuing year are: L. B. Rowland, president; A. E. Brown, vice-president; Lawrence Barnard, secretary-treasurer, and Carl Spurlock, alumni editor.

LOS ANGELES DAIRYMEN MEET

Fully 300 members of the Los Angeles County farm bureau gathered at the Pellissier Ranch between Puente and Whittier, on April 23, to attend the meeting of the dairymen's branch of the farm bureau. The picnic was promoted by G. E. Gordon, assistant farm adviser, who was assisted by members of the Milk Producers Association and the Dairy Council.

The morning was taken up in a judging demonstration of Holsteins from a show ring standpoint and in a guessing contest on the production of eight grade cows. In the former there were some differences of opinion but in the latter the records could not be disputed, and the point was driven home that no one can afford to buy cows by sight alone, for some of the best looking ones were the poorest producers.

In the afternoon medals won in the county cow testing association since November were passed out and a talk on the work of the association was given by Mr. Gordon. At its inception in May, 1918, the average production per cow in the association was 28 pounds of butterfat a month. By weeding out the boarders found by testing, the average for March, 1921, reached 39.2 pounds per cow with 3,285 cows in the association, or a net gain of over 11 pounds. With butterfat at $1 this means a net gain of $11 per cow to the producer in one month. Once tried the cow testing association is never given up. It is the only sure means of telling whether a cow is paying her way or not.

A speech by Sam Greene on the work of the dairy council informed the gathering of the importance of the work being done by that body.

Dr. J. P. Iverson of Sacramento told something of the work of the state department of agriculture in attempting the control of bovine tuberculosis and a general discussion of Senate Bill 98, which has passed both houses and is up to the governor for his signature, ensued. The meeting went on record as being opposed to the bill and petitions were circulated asking the governor to veto it in favor of Assembly Bill No. 38, which covers the same ground without the confiscatory terms of Senate Bill 98. The meeting very strongly urged every dairyman to ask the governor to veto the senate bill.

Geo. W. Brown of Burr Farm acted as chairman of the meeting

FEW AND FAR BETWEEN

London Punch says that a Scotchman recently was asked by a friend:
"How is the world treating you, Sandy?"
"Verra seldom," Sandy replied.

King Alko Hall is off the throne,
King Gas Oline is on it.
The king is dead, long live the king—
But he's much too high, dog gone it.

O Liberty! Liberty! how many bonds have been issued in thy name! —The Freeman (New York).

When selling a customer, be sure to sell him a round trip to your store. It's the "repeater" who pays your rent.

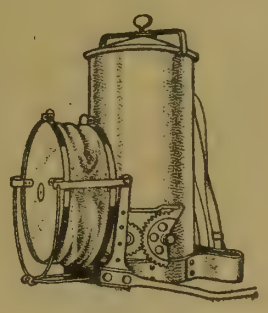
"CALISPRAY" NICOTINE-SULPHUR DUST
KILLS LEAF HOPPER
NOW AVAILABLE



American Beauty Dust Sprayer

100% Efficient

This powerful sprayer — built for orchard, field and vineyard — is one of the fastest, most thorough and economical dust sprayers ever built. The American Beauty, operated by one man alone, will economically spray 15 acres a day in orchard work, with correspondingly greater acreages in field or vineyard.

Government experiments have proven the superiority of dry dust over wet sprays in the control of Red Spider, Thrips, Aphis, Leaf-Hopper and similar insects. Our dust preparations used in the American Beauty Sprayer are unequalled in the eradication of insect pests and fungus diseases.

50% KILL
OF ADULT VINE LEAF HOPPER
AT FRESNO

Under Supervision of
The California Raisin Growers Assn, Inc.

In order to establish the true efficiency of scientifically prepared *Nicotine-Sulphur Dust* for control of Vine Leaf Hopper exhaustive tests were made recently at Fresno under the supervision of the California Raisin Growers Association and *have proven a positive* kill of 50% and better. Watch for complete report in an early issue of this paper.

MOLASSES

"it keeps my stock in better condition," says Mr. J. M. Henderson, Jr., Sacramento, Cal.

Mr. Henderson is the owner of Purebred Stock Farms, and his ideas relative to feeding are soundly based and scientifically carried out. His estimation of the value of Pure Hawaiian Cane Molasses should count with every breeder or stockman.

His letter in greater detail "It has brought results in many ways. I do not hesitate to recommend it to other dairymen. It has enabled me to keep my stock in better **condition at less expense** than any other feed that I have had occasion to use."

Find out what Pure Hawaiian Cane Molasses will do for you, on your farm. Let us tell you of actual profit-making results that others have secured. Average analyses of food values are prepared for you in booklet form. Get this booklet. It is sent free, on request, to men who feed stock. Write today for your copy.

Essentials of Animal Breeding

By George M. Rommel, Chief, Animal Husbandry Division

(Continued from last week.)

The Gestation Period

From the time the egg is fertilized, developments are rapid. The fertilized egg divides and subdivides with multitudes of subdivisions, until in time the embryo "begins to look like something," and we can make out the form of the animal and its parts. The time between the fertilization of the egg and the birth of the young animal is known as the period of gestation. This period varies with the kind of animal. The period for the common domestic animals is shown below, followed by a table to determine how long a time may be expected to elapse between service and birth. To make a practical application of the table count forward the correct number of days from the date of service.

Gestation period of various animals:

Mare	11 months (340 days)
Jennet	12 months (365 days)
Cow	9½ months (280 days)
Ewe	5 months (150 days)
Goat	5 months (150 days)
Sow	4 months (114 days)

Probable date of birth of young, female bred on first day of the month (Sewall Wright):

Date of service.	Probable date of birth. Sow.	Ewe.	Cow.	Mare.
Jan. 1	Apr. 25	May 31	Oct. 7	Dec. 7
Feb. 1	May 26	July 1	Nov. 8	Jan. 7
Mar. 1	June 23	July 29	Dec. 6	Feb. 4
Apr. 1	July 24	Aug. 29	Jan. 6	Mar. 7
May 1	Aug. 23	Sept. 28	Feb. 5	Apr. 6
June 1	Sept. 23	Oct. 29	Mar. 8	May 7
July 1	Oct. 23	Nov. 28	Apr. 7	June 6
Aug. 1	Nov. 23	Dec. 29	May 8	July 7
Sept. 1	Dec. 24	Jan. 29	June 8	Aug. 7
Oct. 1	Jan. 23	Feb. 28	July 8	Sept. 6
Nov. 1	Feb. 23	Mar. 31	Aug. 8	Oct. 7
Dec. 1	Mar. 25	Apr. 30	Sept. 7	Nov. 6

Variation in the period of gestation for animals of the same kind are not explained. Some animals, such as sows, are quite uniform in the length of the gestation period. In mares there is a considerable variation. It has been suggested that in mares some time may elapse between the moment of service and the actual fertilization of the egg by the sperm cell. In guinea pigs the size of the litter affects the period of gestation, the period being shorter for a large litter than for a small one. The health of the mother during pregnancy also has an effect.

During the gestation period the young animal is carried in the mother's womb and is not connected directly with her body. The blood vessels and nerves of the mother do not connect with those of the growing embryo, but from the start the little one has its own little system of circulation and its own nervous system. It is carried in an enveloping sac which is attached to the wall of the mother's womb by buttons (cotyledons) which become detached when the time comes. The young are nourished by blood passing from the mother's body through the walls of the uterus into the sac in which the fetus is carried, and thence into the body of the young animal by transfusion, much as water would pass into a paper sack if you should lower it into a bucket of water.

Incubation Period in Birds

In birds the incubation period corresponds to the gestation period in mammals. The period which elapses from the time eggs are put on to hatch until the chicks emerge is shown foll wing. Young birds are nourished in the embryonic stages of their development by absorbing from the yolk the nutriment needed.

Incubation period of various birds:

	Days.
Goose	30
Duck	28
Turkey	28
Guinea Fowl	25
Chicken	21
Pigeon	17

Much may be learned by any one of a studious nature by careful observations of the development of the embryo of chickens. The germinal disk may be plainly seen even in a fresh laid egg, which, whether fertile or not, looks the same to the naked eye. When put into an incubator, however, the fertile egg begins to develop rapidly, and the transformation in the brief period of three weeks is wonderful. The course of this development in fertile eggs can be distinguished easily from day to day by the familiar process of candling eggs, or it can be studied in detail by carefully breaking the eggs into a saucer.

Determination of Sex

As growth of the embryo progresses, sex becomes apparent. Sex seems to be determined by one of the chromosomes, and is probably settled at the time of conception. The determination of sex is therefore a matter of chance over which the breeder probably has no control. For practical purposes the breeder will find that, over a period of years, he gets nearly equal numbers of both sexes.

Fecundity

The subject of fecundity is of great practical importance to breeders of animals. Fecundity depends very largely on the number of eggs which are matured at a given time by the female. Animals in which multiple births are the rule (of which sows are a common example) not only mature a considerable number of egg cells at one period of heat, but each one is feltilized by a separate sperm cell. In some cases, however, the fertilized egg may divide and twins or a larger number of young result. Such twins are known as identical twins, and are usually of the same sex, with very strong points of similarity. Young from multiple births, resulting from the fertilization of different egg cells, show as wide a difference in individual characteristics as young resulting from separate births. The most prolific of the common domestic animals are the birds. The domestic hen may lay more than 200 eggs in a single year.

The common practice of British shepherds, known as "flushing" ewes, has been claimed to increase the proportion of lambs in the flock. This practice consists in giving the ewes an increase in their feed, both grain and succulent pasture, so that they are gaining in weight and condition at breeding time. No exact scientific data have been available until recent-

ly, when Marshall and Potts of the bureau of animal industry conducted experiments which confirmed the correctness of the British practice. They also have evidence which indicates that the success of the practice depends on cutting off the grain ration and putting the ewes on short pasture as soon as they are bred.

The rules or laws of the inheritance of fecundity are not all known, but to some extent it is dependent on inheritance from the mother; therefore, the selection of females which have a tendency to produce a large number of young at a birth will tend to increase the returns from the flock or herd. This is of practical importance in the case of hogs, sheep, goats and poultry. Twins in cattle are objectionable unless of the same sex. When a heifer is a twin with a bull calf, the heifer is known as a "freemartin" and in the majority of instances is sterile.

Prepotency—Mendel's Law

Prepotency is the power of an animal, male or female, to stamp its characteristics on its offspring. If this ability is handed on to sons and daughters, we say that the stock "breeds on." In rare instances an animal, usually a male, is found which has such power as a breeder that it leaves an indelible impress, even to the extent of becoming the fountain head of a new breed, such as the stallions Justin Morgan, Hambletonian 10, and Denmark.

Most of the cases of prepotency which the breeder usually meets with are probably instances of the operation of what is called Mendel's law. A clear explanation of this great law of heredity can not be made within the scope of this short article, and the interested reader, if he cares to go into the subject in detail, is referred to Dr. Wright's bulletin, U. S. Department of Agriculture Bulletin 905, "Principles of Livestock Breeding."

It must be pointed out, however, that most operations of heredity are not simple; on the contrary, they are highly complex and often extremely difficult to understand. The chief use which the practical breeder of domestic animals can make of Mendel's law at this time is to find in it an explanation of occurrences that otherwise have no rational explanation.

One of the most interesting applications of Mendel's law in cattle breeding is the inheritance of the polled characteristic. If we breed a horned cow to a Red Polled, Galloway, Angus, or other true polled bull, the chances are nine to one or better that we shall get a polled calf. The white face of the Hereford appears to be a similar instance. If we breed a common cow to a Hereford bull, we get a calf with a white face. We say, therefore, that polled breeds are very prepotent so far as "taking the horns off" is concerned, and that the Hereford is prepotent in putting a white face on his calves. This may happen either way; that is, polled bull and horned cow, or horned bull and polled cow, Hereford bull and plain faced cow, or plain faced bull and Hereford cow. The temptation is to make great claims for the prepotency of the breed as a whole on the evidence of one or two points only. For see what happens when we mate a Hereford with one of the polled breeds. Then we get a polled, white faced calf. These points are not prepotency at all, but manifestations of Mendelian "dominance." The polled character is dominant over the recessive horned character, and the white face over the recessive plain face; but these cases do not necessarily indicate that the animal is particularly prepotent in other characters of much more practical importance. The same rule seems to apply in the inheritance of the black color in sheep, black acting apparently as a recessive to the usual white color. It can readily be eliminated by culling out the black lambs.

A great many data have been accumulated as to the characters in animals which illustrate the operation of Mendel's law, but apart from the horns of cattle, coat color, eye color, and the like, the application of this law to livestock breeding has a long way to go before its principles are adaptable to practical use by breeders. It is fairly certain, however, that many of the obscure happenings in animal breeding are really manifestations of Mendelism. Most cases of atavism ("throw backs" to a remote ancestor), for example, are probably Mendelism in practice.

The animal structure is so diverse and complicated that the determination of the application of Mendel's law to the inheritance of the characters which affect the commercial value of domestic animals is a task of tremendous magnitude. Great progress has been made in laying the foundations for the scientific study of animal breeding by working out the principles of this law, and we may expect still greater progress in the future. Biologists who are studying heredity have their faces set in the right direction. The accomplishments of the last twenty years in the study of heredity have taken this subject out of the field of guesswork, and for this service all animal breeders are under obligations to Mendel and his disciples. If, by skillful selection and intelligent breeding methods we can get results of permanent value; if, with the present knowledge, we can make real progress in animal breeding, we can afford to wait for the more definite working out of Mendel's law, with the assurance that this law controls the mechanics of heredity in domestic animals and that any practical application of it to animal breeding will add to our store of useful knowledge and to the efficiency of our breeding methods.

LIVESTOCK VALUE DECREASE SHOWN

Value of livestock on farms and ranges in the United States has decreased more than two and a quarter billion dollars during the last year, according to estimates announced by the department of agriculture.

Livestock on farms and ranges January 1 were valued at $6,235,569,000, compared with $8,507,145,000 in 1920.

Horses numbered 20,183,000, a decrease of 2.9 per cent, and were valued at 1,664,166,000, a decrease of 298,337,000, with an average value of $82.45 per head.

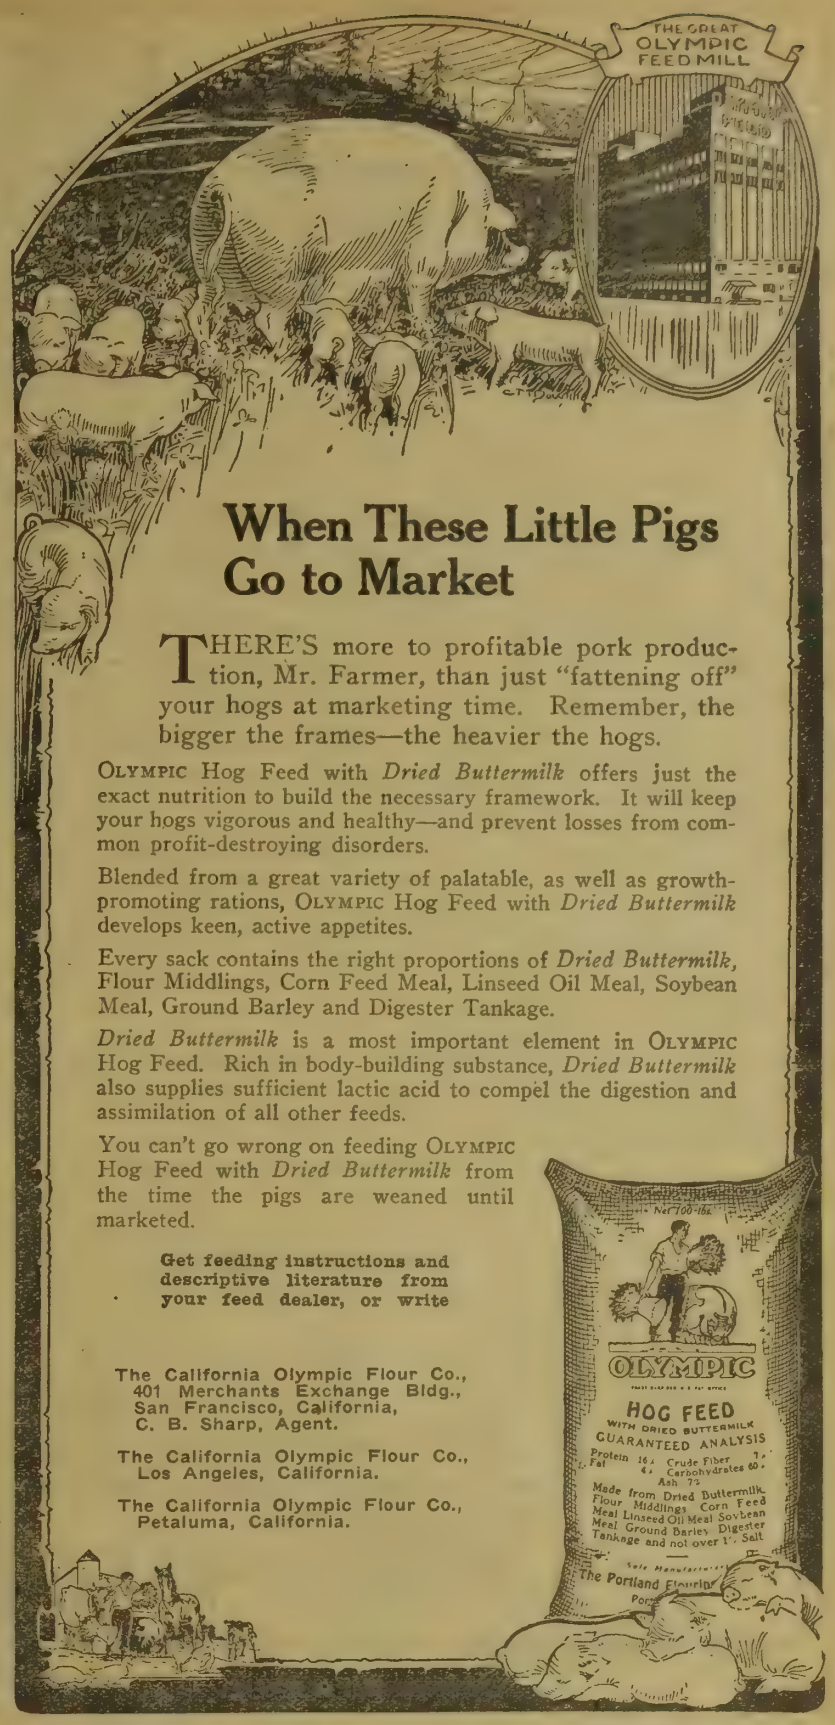
Mules numbered 4,999,000, a decrease of 8 per cent, and were valued at $578,473,000, a decrease of $162,927,000, with an average value of $115.72 per head.

Milk cows numbered 23,321,000, a decrease of 1.3 per cent, and were valued at $1,491,000,000, a decrease of $518,228,000, with an average value of $63.97 per head.

Other cattle numbered 42,870,000, a decrease of 4.2 per cent, and were valued at $1,346,665,000, a decrease of $587,520,000, with an average value of $31.41 per head.

Sheep numbered 45,067,000, a decrease of 4.3 per cent, and were valued at $288,732,000, a decrease of $206,928,000, with an average value of $6.41 per head.

Hogs numbered 66,649,000, a decrease of 7.1 per cent, and were valued at $865,633,000, a decrease of $497,636,000, with an average value of $12.99 per head.



When These Little Pigs Go to Market

THERE'S more to profitable pork production, Mr. Farmer, than just "fattening off" your hogs at marketing time. Remember, the bigger the frames—the heavier the hogs.

OLYMPIC Hog Feed with *Dried Buttermilk* offers just the exact nutrition to build the necessary framework. It will keep your hogs vigorous and healthy—and prevent losses from common profit-destroying disorders.

Blended from a great variety of palatable, as well as growth-promoting rations, OLYMPIC Hog Feed with *Dried Buttermilk* develops keen, active appetites.

Every sack contains the right proportions of *Dried Buttermilk*, Flour Middlings, Corn Feed Meal, Linseed Oil Meal, Soybean Meal, Ground Barley and Digester Tankage.

Dried Buttermilk is a most important element in OLYMPIC Hog Feed. Rich in body-building substance, *Dried Buttermilk* also supplies sufficient lactic acid to compel the digestion and assimilation of all other feeds.

You can't go wrong on feeding OLYMPIC Hog Feed with *Dried Buttermilk* from the time the pigs are weaned until marketed.

Get feeding instructions and descriptive literature from your feed dealer, or write

ANNOUNCING
THIRD PUBLIC SALE
Caledonia Farms
West Sacramento, Cal.
50---Selected Shorthorns---50

For this annual event there has been selected what is generally conceeded to be the most valuable and attractive offering ever made from this famous herd.

40---Cows and Heifers---40

The 40 cows and heifers are evenly divided between desirable Scotch sorts and proven American families. Every Female will either sell with a calf at foot sired by, or bred to

Imp. Caledonia **Gainford Matchless**
Pine Grove King

10—Top Young Bulls—10

The bulls included in the sale are such that should make strong appeal to the man seeking to improve the quality of his herd. There are several good herd bull prospects among them.

Watch for further details.

HOLSTEIN *Fred Hartsook* RANCH CATTLE

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

Sir Aaggie Mead Tops Toyon Sale---$9,250

The dispersal of the Toyon Farms Association's herd of Holsteins at the farms near Los Altos, April 20-21, resulted in what is declared to have been the highest average price ever obtained in this state for a sale containing as many young things as were listed in that event. One hundred and thirty-four head of cataloged bulls and females, many of the lots being yearlings or two year olds, made a general average of $397. One hundred and thirteen females averaged $351 and 21 bulls $641. Twenty-nine buyers absorbed the offering. From every standpoint the sale was regarded as a marked success. The dispersal of the herd was made necessary in order to adjust the interests of Messrs. Hill and Lewis. Mr. Lewis is retiring from the Toyon Farms Association and it is understood that Mr. Hill expects to re-engage in the breeding of Holsteins at an early date.

The feature of the sale, aside from the keen appreciation shown the young stuff, was the sale of the herd bull, Sir Aaggie Mead, to W. J. Higdon of Tulare and F. S. Borror of Tipton for $9,250, the second highest price ever paid for a bull of any breed in a California sale. Much speculation had been indulged in prior to the sale as to who would secure this splendid son of Sir Aaggie De Kol Acme and Aralia De Kol Mead. Several leading breeders were interested in this bull, among them being Frank Helm of Fresno and Gotshall and Magruder of Ripon. The latter firm was the runner up.

No extremely high values were recorded for any of the females. George W. Wendt, who is establishing a herd near Madera, secured the top female in Lucy Segis 2d at $1,100. E. Swift Train of San Francisco took Toyon Piebe De Kol Korndyke for $1,025. A. J. Molera of Monterey was the heaviest buyer, taking 35 head, 34 females and one bull. E. Swift Train selected 11 females of the better sorts. George Wendt took 14 cows and heifers. Among the buyers will be noted many men making their first purchases. The Glenn County Calf Club representatives displayed rare judgment in the nine head of young things they purchased. One of the very best buys of the sale must be credited to Mrs. W. R. Harriman, whose husband is the manager of the Los Angeles County Farm. Mrs. Harriman "put one over" on the ringside talent when she secured Toyon Grant Mead, one of the top daughters of Sir Aaggie Mead, for $460.

The sale was held under the management of C. L. Hughes of the California Breeders Sales and Pedigree Company. Col. Ben A. Rhoades of Los Angeles established the selling price from the box and was assisted by Col. John A. Davis of Manteca, who worked the ring. A representative list of sales follows:

1, Leda Hengerveld De Kol Korndyke, April 1912, 30.8 lbs., M. P. Martin, Santa Clara, $240.
2, Cascade Johanna May Fayne, June 1917; Frank Hatch, Modesto, $485.
3, Cascade Mercedes, Dec. 1916; Geo. W. Wendt, Madera, $425.
4, Ormsby Piebe of Cascade, Jan. 1919; Geo. W. Wendt, $325.
5, Cascade May Korndyke, April 1917, 21.68 lbs.; Geo. W. Wendt, $510.
6, Toyon Juanita Ormsby, April 1919; E. Swift Train, San Francisco, $1,008.
11, Toyon Flora Mercedes, May 1920; lbs.; Peter Peterson, San Jose, $475.
8, Toyon Fleta Johanna, April 1919; E. Swift Train, $710.
9, Toyon Lady Van, June 1920; A. J. Molera, Monterey, $250.
10, Toyon Beauty Mercedes, April 1930; A. J. Molera, $285.
11, Toyon Flora Mercedes, May 1920; E. Swift Train, $375.
12, Toyon Vickery Mercedes, April 1920; W. D. McCann, San Francisco, $325.
13, Toyon America Mercedes, April 1920; Geo. W. Wendt, $375.
14, Toyon Fobes Mercedes, June 1920; A. J. Molera, $375.
15, Ashburn Grace Ormsby Peep, April 1920, 17.27 lbs.; A. J. Molera, $500.
16, McCloud Bonheur De Kol Canary, Nov. 1917; Millbrae Dairy, Millbrae, $700.
17, McCloud Quidee Pietertje, Jan. 1918, 14.52 lbs., Millbrae Dairy, $700.
18, McCloud Ormsby De Kol, Oct. 1917, 11.76 lbs.; Millbrae Dairy, $725.
19, Jessie Milky Pontiac, Nov. 1919; E. Swift Train, $700.
20, Belle Washington Pontiac Maid, Mar. 1919; E. Swift Train, $625.

CALEDONIA SHORTHORNS

Imp. Caledonia

Caledonia Shorthorns constitute one of the choicest collections of the breed owned in America. Our herd bulls, Imp. Caledonia, Gainford Matchless, grand champion at the 1919 San Francisco show and Pine Grove King stand out prominently in the West. Our females represent choice Scotch and American families, and are noted for their type and quality. We can at all times furnish foundation material and bulls suitable for any herd or for the range. Our prices are moderate and every animal is guaranteed. Visit our farm and herd. Send for special bull list.

CALEDONIA FARMS
WEST SACRAMENTO, CALIF.
OFFICE—57 POST ST. SAN FRANCISCO.

Shorthorn Cattle

My herd consists of Scotch and American families headed by the Marr Clara bull, Clarion. Just now I have a few good young bulls and a few females for sale at right prices. Market your crops through good Shorthorns.

GEO. E. DIERSSEN
Box 913 Sacramento, Cal.

Make Money

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

May 11, Victory Herd, Carruthers.
May 18-19, James McGillivray, Sacramento.

Shorthorns

May 26, Caledonia Farms, West Sacramento.

Announcement is made this week of a sale of Shorthorns to be held by Howard Vaughn of Dixon on May 26. Mr. Vaughn moved to this state from Iowa last year, where he was one of the prominent breeders, as well as secretary of the Iowa Shorthorn Breeders Association. This sale will be the first of what Mr. Vaughn expects to make an annual event. About 40 head of bulls and females will be in offer. The sale will follow the annual spring vendue from Caledonia Farms, West Sacramento, May 25.

Gardiner Blackman of Long Beach reports the sale of his prize winning Berkshire sow, Model Lady 69th, to George A. Stingle of El Monte. He also states that he has sold his Jersey show heifer, Burnside Bee's Gipsy, to Ferdinand R. Bain of Palms. Mr. Blackman is one of Southern California's younger breeders and formerly a member of the Inglewood High School Pig and Calf Club.

Carnation King Sylvia, the famous $106,000 Holstein bull at the head of the Carnation Stock Farms herd, died last week. Probably no bull of the breed was better known than Carnation King Sylvia and his fame did not rest on the sensational value placed on him. While still a young bull his record in the breeding herd has been such that great things were expected of him.

John A. Bunting of Mission San Jose reports the sale of a young Hereford bull to W. O. Wool of Milpitas. The calf was sired by Beau Columbus. Bunting states that Mr. Wool is convinced that range operators cannot afford to use any but the best bulls obtainable.

Shorthorn breeders will regret to learn that Blackhawk Roan Lady, shown by Easton and Ward in the two year old classes last year, died recently as the result of a wire entering the stomach in the feed. Blackhawk Roan Lady had improved greatly since the fall shows and it was expected that she would be a strong contender for high honors this year. She was sired by Roan Radium and her dam was Roan Lady 37th.

Following the purchase of Sir Aaggie Mead in the Toyon dispersal sale, W. J. Higdon announced that Frank Helm of Fresno had taken over the bull, Sir Aaggie De Kol Acme 2d, recently purchased by Mr. Higdon from Alex. Whaley of Tulare.

Jessie Segis It, a junior four year old Holstein owned by H. E. Spires, Caruthers, has completed a seven day record of 26.205 pounds butter from 561.1 pounds of milk; Eldorado Beryl, a junior three year old, has completed a seven day record of 19.332 pounds of butter from 451.1 pounds of milk and has to her credit a 30 day production of 79.526 pounds of butter from 2,109.8 pounds of milk. The final and corrected record of Norma Korndyke Cornucopia for seven days is given as 38.416 pounds of butter from 673.1 pounds milk. In 20 days she has 104.18 pounds of butter from 2,043.7 pounds of milk.

Experimental Defender, the Duroc-Jersey boar at the head of H. P. Slocum & Son's herd, djed recently. This is the third valuable herd boar lost by Messrs. Slocum within the past year.

Burr Farm of Los Angeles is having wonderful luck with King Korndyke Pontiac 20th in the way of a sire, as seven of his first nine calves have been heifers. As he is being bred to only the choicest cows, the farm will have a wonderful lot of his daughters before long.

A Big Opportunity

to buy registered Holsteins that are bred in the lines of the breed's greatest milk production; young cows bred to bulls with tremendous milk and butter production back of them; the largest number of fresh cows and heavy springers that have ever appeared in a western Holstein sale; just the sort of females that are ready to make profit for the buyer the minute he gets them home.

Willowmead Herd, Sacramento, Cal.

Owned by James McGillivray

177 REGISTERED HOLSTEINS 177

167 Females—10 Bulls

Wednesday and Thursday
May 18-19, 1921

28 DAUGHTERS OF
DUTCHLAND SIR KORNDYKE COLANTHA
who is by a full brother to the great foundation cow Pontiac Clothilde De Kol 2nd, the first cow to make over 37 lbs. butter in 7 days and over 1260 lbs. in one year. His dam is a 24 lb. daughter of Colantha Johanna Lad that milked 657.2 lbs. in 7 days and made 750.48 lbs. butter from 22,645.6 lbs. milk in one year.

18 DAUGHTERS OF
KING PONTIAC RUBY BURKE
who is by King of the Pontiacs, the only double century sire, and out of a 25 lb. half sister to the former world's record milk cow Riverside Sadie De Kol Burke. He already has seven yearly record daughters with records up to over 850 lbs. butter for a 3 year old.

17 DAUGHTERS OF
PRINCE BUTTER BOY WALKER
who is by Prince Gelsche Walker out of a dam that made 828.62 lbs. butter from 19,543.2 lbs. milk in one year, she by the same sire as the 1008 lb. yearly record cow Miss Blaney.

14 DAUGHTERS OF
KORNDYKE COLANTHA PARTHENEA
Who is by Dutchland Sir Korndyke Colantha (see above) and out of the great breeding and producing cow Minnewawa Louise, who has seven A. R. O. daughters with records up to over 32 lbs. butter in 7 days.

10 DAUGHTERS OF
KING MEAD OF RIVERSIDE
the famous sire of yearly record producers, including the world's strictly official yearly record cow Aaggie Acme of Riverside 2nd. A number of these have large yearly records as well as 7 day records.

8 DAUGHTERS OF
YOLO VALDESSA HENGERVELD
Who is by the 41 lb. bull King Valdessa and out of a 30 lb. dam.

The sale also includes daughters of such sires as King Korndyke Pontiac, King Pontiac Topsy, Colantha Sir Pontiac Aaggie, and King Segis De Kol Mead.

COWS AND HEIFERS WITH RECORDS UP TO OVER 32 POUNDS BUTTER IN 7 DAYS.

A CONSIDERABLE NUMBER OF COWS AND HEIFERS WITH YEARLY RECORDS.

DAUGHTERS OF COWS WITH RECORDS UP TO OVER 32 POUNDS BUTTER IN 7 DAYS AND UP TO OVER 1000 POUNDS BUTTER IN ONE YEAR.

WILLOWMEAD HERD contains over 500 head of registered Holsteins at the present time. This sale includes every cow in the herd that is in salable condition. The oldest cows and some with defective udders are kept to furnish milk for the large number of young calves in the herd.

OF THE 167 FEMALES in the sale 93 are 2, 3 and 4 year old heifers; 49 more are 5 and 6 year old cows. There are 85 fresh cows in the sale, many others milking heavy right along, also a large number of heavy springers.

MORE THAN HALF OF THE FEMALES are bred either to COLONY ZARILDA NEWMAN, son of the great 33,000 lb. Canadian cow Zarilda Clothilde 3d De Kol, or to PRINCE ECHO SYLVIA SEGIS, who is sired by a son of the great producer May Echo Sylvia.

Every animal positively guaranteed to be a breeder; no tuberculin test certificates.

Auctioneers:
Col. Ben A. Rhoades, Los Angeles
Col. John A. Davis, Manteca

Management
California Breeders Sales and Pedigree Company
C. L. Hughes, Sales Manager, Sacramento, Cal.

The owner is prepared to extend liberal terms to responsible parties. Applications for credit may now be made either in person or by letter to JAMES McGILLIVRAY, R. 1, Sacramento, Calif.

Carload Unregistered Shorthorn Heifers

I have a selected lot of pure bred but not registered Shorthorn heifers, well grown, of good colors and running from two to three years old that I can spare. The prices will average but slightly more than beef prices. If you have feed this is a great chance to get 30 or 35 young heifers that will make you money. All sell tuberculin tested.

T. S. Glide Davis, Cal.

Italian Vineyard Company
Big Type Berkshires

Some dandy young boars for herd headers. The choicest breeding and ready for service.

Every one tuberculin tested and cholera immune.

Alex. M. Wilson, Supt. Guasti, Cal.

The Milch Goat and Her Kid

By Jean A. Koethen

"MY problem is goats," writes a Madera subscriber, Mrs. S., a young mother who declares goat milk saved her baby's life. "How do you feed a fresh goat and kid? Should the goat be salted? I understand they can be overfed. How soon should milk be used after the goat kids? Is it better to milk twice a day or more frequently? How soon would you breed, and how soon should you quit milking before the goat kids? Anything you can tell me will be greatly appreciated."

It is customary to dry up a milch boat about two months before she is to be fresh, which is exactly 150 days from the day she was bred. She should be kept on a milk ration, however, and if this is her first kidding she should be fed for milk for two or three months before. Rolled barley, which Mrs. S. says she is feeding, is a standard feed for goats of all ages, but it is not really a milk producing feed. Bran and dried beet pulp are both better and the ration generally used includes the three, as well as alfalfa or other good green. Alfalfa is, I suppose, the best single feed for goats, but it must be accompanied by bran and barley or the ration will not be balanced. Dried beet pulp is considered one of the best feeds for a milk goat, but they do not like it as well as other things, and the method of feeding must be suited to the doe's taste. Before my goat came fresh she liked the pulp dry, and would eat a pint of it at a time. After she kidded she seemed to prefer it soaked and mixed into a mash with bran and barley, which is the best way to feed it. Later she conceived a distaste for the moist mash, and I gave her dry pulp alone for breakfast and bran and barley for supper. After a while she refused the beet pulp alone, and I mixed it with the bran and barley, equal parts.

Can a goat be overfed? Not if they are all like mine. If there is a fastidious eater in this world, it is a milch goat. She eats what she wants, which is presumably what she needs, and you cannot coax her to eat more.

There is a salt cake sold at feed stores which is generally kept before goats when they are not staked out. Its only purpose is to make the doe thirsty so she will drink more water, and therefore give more milk. Mine would never touch it.

Opinions differ about how soon after kidding the milk should be used. Some think it should not be used for ten days; others say it is all right after a dozen milkings. As soon as it tastes all right and looks all right it cannot be far wrong, one would think. Goat people generally hold that a goat, like a cow, should be milked more frequently at first than later. Three times a day for the first three weeks is the rule. This establishes the flow of milk. I do not know that it is necessary to feed three times a day when you milk three times a day, but it does no harm and the doe is better satisfied.

In regard to time of breeding there are also differences of opinion. Some people breed as early as seven months of age, others hold that a goat should not begin to produce till she is two years old. Undoubtedly seven months is too young, but I have known a number of does, bred at 10 and 11 months, that came in excellent milkers. It depends somewhat upon the size and maturity of the doe, somewhat upon the season. There are those who hold, too, that a doe may be bred three or four months after she has kidded, if for any reason it is desirable to bring her fresh earlier the next season, but this seems hardly reasonable. One kidding in 12 months, with two months rest from producing, will surely conserve the doe's health and vigor and make her a better producer and a producer for a longer time. Because the milch goat is willing and faithful is no reason for driving her beyond her strength. Treat her kindly and humanly, with due consideration for her likes and dislikes, and she will be your best friend.

Feeding the Kid

Milk, it goes without saying, is the one best ration for any young animal, but milk is expensive, and gruel is a good substitute. I fed my kids on a gruel made by boiling rolled barley in water for 15 or 20 minutes, then straining it and adding as much milk as I could spare. This gruel should at the first be two-thirds milk, but as the kid grows older and stronger and drinks more the amount of milk may be diminished till there is barely enough to color the gruel. When I ran out of barley for a day or so I tried oatmeal gruel which I think is even better but costs more. The kid was fed four times a day at first, but the number of meals was reduced to three as soon as she would stand for it. As soon as she would eat rolled barley she was given a little each day, and presently bran was added to the barley. If a kid is kept on barley alone it is hard to induce her to eat other grains.

How is a little kid fed? I thought she would drink from a basin as an older one does, but I was disappointed. Some folks can teach a kid to drink the first day by putting a finger in the milk and letting the kid suck it. I had to send for a nipple and give mine the bottle for several weeks before she would consent to drink.

STARTS NEW HOLSTEIN HERD

George Stam, who recently returned from Holland, has decided to establish a pure bred Holstein herd on his ranch near Kirksville in Sutter Basin. Stam has started with some high class cows which he purchased from Fred J. Kiesel of Sacramento, who recently sold his herd at an average of $490 a head.

"I intend to have none but pure breds on my place," declared Stam. "They are the most economical cows in the long run. I look forward to seeing thousands of dairy cattle in Sutter Basin and it is my purpose to raise pure bred bulls to supply these farmers with the best stock obtainable. I have headed my herd with the Holstein sire, Aristo Korndyke Pontiac, one of the best young bulls of the Kiesel herd. This bull is out of the famous cow Ontario Blonde Pietje, which has a seven day butter record of 33.07 pounds. He was sired by It, a very famous Southern California bull imported from New York."

Stam's first string of pure bred cows numbers 12, which were purchased at the Kiesel sale. This string will be augmented from time to time. Stam is now having plans prepared for a model dairy barn and paddocks, which will be the home of his high class cattle. A recent arrival from Holland who is an expert dairyman is to take charge of the herd. This is very much in keeping with the entire project as the native home of Holstein cattle is Holland.

How About It, Mr. Farmer

By Frank D. Tomson

For several years past there have been frequent expressions to the effect that the prevailing prices for pure bred stock were too high to attract farmer patronage; the term "farmer" being generally applied to land owners or tenants not growing pure bred stock.

Through this period, however, there was a more extensive trade among farmers than ever before. Many of the farmer buyers planned definitely to become growers of pure breds exclusively while others recognizing the necessity of growing animals of better quality, more weight for the feed consumed, and certain to make larger profits, were buyers of pure bred sires. Gradually the prices on pure breds, more particularly those that represented the more popular blood lines, increased and reached levels out of range of the farmer trade. Not necessarily out of range after these farmers had become adjusted to the pure bred business, but too high for immediate profits.

There exists today, however, a situation that is altogether favorable to the farmer investor. There is just as much need under present conditions for shifting from inferior or grade standards to the more responsive and consequently more profitable pure bred types as ever and at present costs the advantage rests very decidedly with the farmer. In beef cattle trade very good individuals among pure breds representing established blood lines may be obtained now at prices that leave no excuse for the farmer producing cattle of the common sorts. The difference in the original investment and the cost of maintenance is all in favor of the pure breds of worthy type. There is no question but that pure bred values will gradually work toward a higher plane so buyers of the present time are assured an increased valuation. Certainly any farmer who has a liking for livestock and with a reasonably serviceable set of farm improvements can make a paying investment now by selecting a few pure breds of individual merit and allow their numbers to increase on his farm until finally his entire herd is made up of pure breds. Under present conditions I would encourage any farmer to invest in a larger number of pure breds than I would have advised during the days when the prices ruled on higher levels. The farmer need not expect pure bred values to decline. Whatever change comes will be in an upward direction. It is a question now of the farmer's plan; if he intends to stay on the land and grow livestock his best opportunity for profits is with pure breds. He should keep this in mind, whether prices are high or low, a pure bred will sell ordinarily for from two to four times as much as a grade. There are occasional exceptions, but these exceptions more often are in favor of pure breds than of grades; in fact, the better class of pure breds, that is, good individuals representing the more popular lines of breeding, will command prices from five to ten times higher than the best grades and usually much more. But I have in mind when discussing the sorts which the farmers are most liekly to be interested in, worthy individuals of miscellaneous breeding that are not generally sought after by enthusiastic buyers who are pedigree critics and who make the pedigree the first consideration, but not disregarding individuality. For all practical purposes the other sorts will suffice equally well. Individuality must be sought after for it is this individuality that insures the difference in profits and values.

As a suggestion to the farmers, breeders are now giving their herds a careful sorting, retaining the best of the blood lines which they desire to have represented in their herds and are permitting the others to go. It is just as important that the farmer should sort his herd and substitute for those of the less profitable kind animals of better and more efficient standards. It will be found that many of these which well established breeders are willing to dispose of at very moderate prices are just the kind that will fit into the farmer's situation. The breeder is disposing of them not for lack of individual merit, but because of his desire to maintain only the more fashionably bred kind. He has an established trade, his patrons are looking to him for these popular blood lines and he wisely selects his animals with that in mind. This gives the farmer an opportunity which he should not hesitate to take advantage of.

We cannot ignore the gradual upward tendency of production costs. Presumably these costs will be lessened somewhat from those of the past two or three years, but the tendency is upward generally and there is no other way for the livestock man to operate profitably under these growing costs than to produce a better class—more pounds at a given age and better quality which can only be assured by the increasing use of pure breds.

GUERNSEYS SOLD IN 1920

Five hundred and eight dollars was the average price paid for 2,464 Guernseys in 49 sales reported in the Guernsey Breeders Journal from January 1, 1920, to December 15, 1920, inclusive. Two thousand and eighty-eight females brought $1,107,489.70, an average of $530.41. Three hundred and seventy one bulls brought $144,551.46, an average of $389.63. Six Guernseys whose sex was not stated brought $365, an average of $60.83. The total sales amounted to more than one quarter millions of dollars, to be exact,$1,252,406.16.

The average for 1920 is indeed encouraging in view of the depression in business conditions. Some sales have brought low averages and have tended to cast a gloomy aspect upon the entire pure bred dairy cattle situation, but when the facts are brought out we find that the past year has been very flourishing for Guernsey breeders. The average for 1919, which was $546, was not quite reached, but the total number of cattle sold in the last year exceeded the number sold in 1919 by more than 88 per cent.

HOW TO CONTROL HOG MANGE

Hog mange is spread mainly by direct bodily contact, according to investigations recently conducted by the United States department of agriculture. The disease is contracted most rapidly among hogs of low vitality, especially those kept in small enclosures. It spreads more slowly among vigorous animals kept in pastures or in clean, well lighted, roomy pens or buildings. The disease can be eradicated by four dippings in a lime-sulphur or arsenical solution with intervals of six or seven days between dippings.

Dispersal of Choice Holsteins

Norma Korndyke Cornucopia 38.41 lbs. butter from 673.1 lbs. milk in 7 days. She is a granddaughter of Pontiac Korndyke, and is the highest 7 days record cow ever sold at public sale in California.

THE VICTORY HERD

Owned by

H. E. Spires and J. M. Crawford

Hillcrest Ranch

Carruthers, Cal.

Wednesday, May 11, 1921

This dispersal is necessary in order to dissolve the partnership existing between H. E. Spires and J. M. Crawford, as the only means by which they can arrive at the actual value of the herd.

Neither partner will retire from the breeding of registered Holsteins, but they have made a positive agreement that neither one will bid on or buy a single animal in this sale, in order that there may be absolutely no question in the minds of other buyers as to the position of the owners.

THE VICTORY HERD is a choice collection of young cattle, including several really outstanding animals. The herd has been handled under average dairy conditions and in official test work has developed some splendid producers.

The sale contains the highest 7 day record cow ever sold at public auction in California, and a group of twenty-four granddaughters of the famous Hackney bull King Segis Pontiac Count, affording California buyers their first opportunity to buy so many females of this breeding at home. The list of females includes

NORMA KORNDYKE CORNUCOPIA, 38.41 lbs. butter from 673.1 lbs. milk in 7 days. She promises to make about 150 lbs. butter from 3000 lbs. milk in 30 days, milking as high as 114 lbs. in one day, and will be carried on test right up to sale day and sold open. She is a most attractive individual, with plenty of size, and is sired by a son of Pontiac Korndyke and out of a daughter of King Korndyke Cornucopia, whose 26 lb. dam made 722.07 lbs. butter from 17,245.4 lbs. milk in 278 days, and she is a daughter of the century sire Aaggie Cornucopia Johanna Lad. Last year, as a junior 4 year old, Norma Korndyke Cornucopia made 28.72 lbs. butter from 665.1 lbs. milk in 7 days.

A YEARLING DAUGHTER of Norma Korndyke Cornucopia, sired by Sir Piebe De Kol Segis Pontiac, son of King Segis Pontiac Count and a 717.46 lb. yearly record cow.

A HALF SISTER TO NORMA KORNDYKE CORNUCOPIA, by the same sire, out of a granddaughter of the century sire Changeling Butter Boy.

A HALF SISTER TO NORMA KORNDYKE CORNUCOPIA, by the same sire, out of a granddaughter of the century sire Sir Pietertje Hengerveld Segis.

TWO DAUGHTERS of the above cow, full sisters, sired by Sir Piebe De Kol Segis Pontiac, both with over 15 lbs. butter in 7 days as 2 year olds.

A DAUGHTER OF A 27 POUND COW that milked 637.1 lbs. in 7 days, heavy with calf to Sir Piebe De Kol Segis Pontiac.

A 27 POUND 3 YEAR OLD granddaughter of King Hengerveld 6th out of a granddaughter of Pontiac Korndyke, bred to Sir Piebe De Kol Segis Pontiac.

A DAUGHTER of the above 27 lb. 3 year old, by Sir Piebe De Kol Segis Pontiac, bred to King Pontiac Alcartra Prilly, 36 lb. son of the three times grand champion King Segis Alcartra Prilly.

A 26 POUND JUNIOR 4 YEAR OLD that milked 561 lbs. in 7 days. She is by a grandson of King of the Pontiac, out of a dam sired by a grandson of King Segis.

A 22 POUND 4 YEAR OLD, bred to Sir Piebe De Kol Segis Pontiac.

TWO DAUGHTERS of the above 22 lb. 4 year old, full sisters, sired by Sir Piebe De Kol Segis Pontiac.

A 19 POUND JUNIOR 3 YEAR OLD sired by a 31 lb. son of Segis Pontiac De Kol Burke.

A DAUGHTER OF MERCI LAD KORNDYKE BURKE, grand champion at 1920 California State Fair, out of an 18 lb. 3 year old daughter of Prince Gelsche Walker. Heavy with calf to Sir Piebe De Kol Segis Pontiac.

24 DAUGHTERS OF SIR PIEBE DE KOL SEGIS PONTIAC, therefore granddaughters of King Segis Pontiac Count, many of them bred to King Pontiac Alcartra Prilly.

BULLS IN THE SALE

SIR PIEBE DE KOL SEGIS PONTIAC, born Feb. 16, 1914. He is by King Segis Pontiac Count, the famous bull owned by Senator Hackney in Minnesota, and is out of a dam that made 717.46 lbs. butter from 17,635.2 lbs. milk in one year. He already has 10 A. R. O. daughters, splendid producers, and he is only a young bull yet.

KING PONTIAC ALCARTRA PRILLY, the junior herd sire, is by King Segis Alcartra Prilly, the Bridgford three times grand champion whose daughters are starting off with extraordinary production at first calving. His dam is Spring Farm Pauline Pontiac 2nd, 36.63 lbs. butter from 816.1 lbs. milk in 7 days, 982.32 lbs. butter from 26,262.2 lbs. milk in one year. She has three 7 day records averaging 31.49 lbs. butter and 703.3 lbs. milk. His seven nearest dams average 31.02 lbs. butter in 7 days, and five of them have yearly records up to 1127.85 lbs. butter.

A NUMBER OF YOUNG BULLS, some good enough to head breeding herds, others that will no doubt go at dairymen's prices.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

NOTE: This herd has been tuberculin tested regularly since its establishment five years ago. Only two animals have ever responded to the test, and one of these was an animal brought in by purchase subject to 60 day retest. Every female in the herd, of milking age, has dropped a normal living calf within the last year, and there has never been a case of abortion in the herd.

Catalog of sale free on request.

For Sale—Saanan Doe, registered, ¾ grade, fresh. Mrs. Wetzel, Hanford, California.

BUILDING UP A HIGH PRODUCING DAIRY HERD

(Continued from Page 575.)

cut down the amount for a few feeds, and they are generally ready to eat it again. Sometimes they get tired of the same feed and a change of grain for a few feeds does them a lot of good, giving them a new appetite. If a cow is going to be a good producer she must be kept satisfied and contented.

I realize also that to get good results a man has to have good cows to work with and to build up a good herd is a trying proposition. I have been very fortunate in getting together my present herd. I bought 14 first calf heifers two years ago, and with them as my foundation I have culled and bought more as I have been able. About one-half of my present herd are first and second calf heifers raised from the herd of 30 cows I sold at auction two years ago for an average of $205 per head. The heifers are large persistent milkers and in most cases high testers. Most men consider that the cheaper they buy a cow the more money they save, but not so with me. If I find a cow that comes up to my dairy cow judgment and I have good reason to think her a good producer, I don't stop at the price, but buy her at any cost within reason. I have paid up to $325 for a grade cow, and she has proved well worth the price. I judge a cow's worth by the amount of butter fat she will produce in a year. If she produces 400 or 500 pounds she is worth whatever the butter fat will bring, deducing feed costs.

I am very particular about milkers. They must be conscientious men that will milk a cow clean and be gentle with them. I will not have a man who mistreats my cows.

The cows are being milked three times a day. The increased production is between 20 and 30 per cent. For instance, I have a second calf heifer that has milked over 80 pounds milk a day, and if she had been milked only twice a day she could not have given over 60 or 65 pounds because her udder is not large enough to carry more than 30 pounds at one time. It is also good to milk first calf heifers three times a day as it develops their udders and trains them to milk persistently.

I consider that I owe my success to both feeding and breeding. As I have said before, I have always had good cows and have always used good pure bred bulls, but a man can breed and breed forever and if he fails to feed he will have no more production than if he had common scrub cows.

I always say every dairyman should belong to a cow testing association to really have a fair chance to cull his cows. I have belonged to one for the last four years and have sold a number of cows to the butcher because of it. I feel I have been well paid for my trouble and expense.

So when you get right down to the facts, the main reasons for success are to keep all good cows, feed them the best always and be sure to keep a good pure bred bull.

I am sorry I cannot give the names of the sires of my heifers that are now milking, but I didn't use to keep any record of which bull I bred the cow to and I have most always kept two bulls. The sire of some of them is King Beets Sola De Kol. I had him two years ago when I sold my herd.

The bulls I am using now are Sir Parthenea Alcartra Korndyke, King Mead Mita, and for my heifers, Sir Veeman Segis De Kol Burke, a son of my 33.06 pound three year old cow, Princess Maida Veeman. She made over 20,000 pounds milk and 750 pounds butter in a year as a junior two year old. The last two bulls I have raised and know they have good producing dams.

Roup a Preventable Disease

By Jean A. Koethen

THE first step in eradicating any disease is to find its cause. To cure is one thing, to eradicate is another. Roup is easily curable for the time being—but to eradicate roup means to get rid of every one of its causes, and then to get rid of all the stock that has been affected or infected by the disease. An expert whose name I have forgotten is quoted as saying that as long as he cured roup he had roup in his flock. When he ceased to try to cure it, except by means of that most certain remedy, the ax, he eradicated it for good and all.

The causes of roup may be summed up under two heads, filth and dampness. Filthy air in the roosting house is one of the most potent causes. Damp air, which is usually filthy as well, is another. Now damp air may be of any one of several varieties. It may be damp because of the weather. There is no harm in the damp air we all have to breathe during a rain, provided the roosting quarters are dry and comfortable. It may be damp because the henhouse is located in a hollow and the heavier air falls from the higher levels upon it. I doubt if roup can ever be entirely eliminated in such a place. Again, and more frequently, and worst of all, it may be damp because ventilation is insufficient, and what little air the hens are allowed is loaded with moisture from the bodies of the birds as well as with odors from the dropping boards. It is because of the difficulty of keeping the air fresh in a house in which several hundred hens are confined that experts have made the rule of three square feet of floor space to a hen. Even with this amount of room the air will be foul if provision is not made for circulation. With the front of the house entirely open and an air current coming in behind the roosts but kept off the heads of the birds by a ceiling of wood or beaver board or tarred paper the problem is usually solved.

Winds and Drainage

Roup is quite sure to occur in a flock that is exposed to a damp or very chilly wind. For this reason it is important that the house should front away from the direction of prevailing winds, and that there should be some protection from winds that cannot be thus avoided. Take, for instance, certain localities near the coast where north winds sometimes prevail. Here, if the front of the house is away from the north wind it is exposed to the west or southwest coast breeze, which is always damp and frequently chilly. Such a house needs more provision in the way of shutters and windows for keeping out the wind than is necessary in dry inland valleys. The yard should also be protected, or at least a part of it, by some windbreak that will permit the hens to be out of doors and still out of the wind. A high fence answers this purpose very well. Hens dislike a high wind rather more than they dislike rain, and it is a greater menace to their health.

Water drainage we all understand and it is not necessary to emphasize the importance of placing poultry yards in such a location that water from higher ground cannot drain into them. Air drainage is not so readily understood, and yet it is just as important. Wherever possible a southern slope should be chosen for the location of the poultry plant just because on such a slope dampness is at the minimum. Water and damp air drain off and the hill cuts off the cold north wind.

Naturally, a south slope is not always available, and when it is not sanitation must take its place. An open front house which admits the winter sun to its farthest corner, with back and ends closed tight against drafts, three feet of floor space for every bird, dry floors with clean scratching litter, frequent removal of droppings and cleaning of dropping boards, monthly disinfection of walls and roosts, clean nest litter, fresh water, above all, ample protection from wind and rain, these are the chief secret of roup prevention.

Recognizing Roup

But how shall the novice recognize roup? In the first place roup is a cold, but it is more than a cold. It is not always easy to distinguish between an ordinary cold and real roup, but distinguishing it is not very important. A catarrhal cold today may run into roup tomorrow, and the same conditions produce both. In general, when there is a watery discharge from the nostril or slight rattling in the throat, we say the bird has a cold. When the discharge is thick, with noticeable odor, when it gathers in swellings under the eyes, when the eyes are swollen or sticky or closed, or when the throat contains whitish or grayish patches or exudate, we say the bird has roup. These symptoms are seldom all present. If they are, the bird is in a very bad way and might as well be killed. Many cases of chicken pox are accompanied by roupy symptoms. In fact this occurs so frequently that some authorities declare roup and chicken pox are practically the same disease.

As soon as a single bird in the flock shows any of the above symptoms or the fever and dullness which frequently accompany them, she should be removed, put in a dry, warm place and treated. It is hard to say just how contagious the disease is, but there is some danger of contagion. When many cases occur it shows that there is something radically wrong in housing and sanitation, and the error must be corrected before the disease can be wiped out.

Treatment

There are plenty of cures for roup, both proprietary medicines and home remedies, all good in their way, but none of them will permanently cure the disease unless the cause is removed. The potassium permanganate treatment has often been mentioned on this page and need not be described again. Its chief virtue is its simplicity. It must be remembered, however, that while potassium permanganate is an excellent antiseptic and very useful for cleansing the nasal passages, it is of little use, if any, when taken internally. When used in the drinking water it may prevent contagion but has no other virtue, and it loses its strength very quickly in solution.

Dr. Sanborn recommends this solution for a spray for all the mucous surfaces: Extract of witch hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons. This is applied twice a day with a bulb syringe, squeezing the bulb 5 times for each nostril and twice for the mouth. ties of nose and thoat with peroxide Dr. Salmon advises washing the cavi- of hydrogen diluted 1 to 3 times with water. When the eyes are affected they may be cleansed with cotton dipped in a solution of boric acid or of boric acid and chamomile. When there are swellings under the eyes they should be opened and thoroughly cleansed with some antiseptic.

A successful turkey breeder uses this spray for roupy turkeys: 2 teaspoons castor oil, 1 teaspoon turpentine, 1 teaspoon kerosene. Nostrils, cleft in mouth and any abscesses that have been opened are sprayed once a day with this mixture.

Poultry Queries

Conducted by Jean A. Koethen

Will They Hatch?

My two turkeys, a hen and a tom, are both young. The other day I found the hen sitting on 11 eggs out in the grass. I took them from her and put them under a hen. Can anyone tell me if these eggs will hatch and how soon my turkey will start to lay again?—Subscriber.

Nobody can say whether or not any given egg will hatch. You can find out if the eggs are fertile by testing them before a strong light just as you would chicken eggs. You can buy a tester at any poultry supply house. If they are dark inside they are fertile; if clear, you know they are infertile. If there are dead germs this is sometimes indicated by a red ring, but you cannot always be sure about it, especially toward the end of incubation. The germs in eggs from a young hen mated to a young tom will not be as strong as they would if the parents were of different ages, but you may get a good hatch for all that. It depends on the vigor of the birds and their care and feeding. The hen ought to be laying again in a week or so.

Roup of the Eyes

Some of my three weeks old White Leghorn chicks have their eyelids stuck together. When I pull them open they can see, but there seems to be a film growing underneath the eyelid.—Subscriber, Chino.

I am afraid your chicks have roup of the eyes. You should isolate all the affected ones and wash their eyes morning and night with a boric acid solution, about one-half teaspoon of boric acid in one-half pint of warm water. You can drop the solution in the eyes with a bit of absorbent cotton. Before they are shut up for the night, anoint the edges of the lids with pure white vaseline, the kind that comes in a tube, to keep them from sticking together. Something is making your chicks take cold. Is it that they are not warm enough at night, or that they are overcrowded and therefore too warm, or are they, perhaps, exposed to a strong wind during the day? The only permanent cure for roup is removal of the cause.

Various Troubles

I am losing my turkey hens and chickens and would like some advice. We cut open a hen today and found her liver normal though light in color, but surrounded by great clots of blood. The turkey hens have a whitish diarrhoea, lose their appetites and stand around and die. A chick died this morning. Its crop was full of water, which ran out when I pressed the crop. —Subscriber, Fillmore.

The hen you cut open may have had cholera. That bloody condition of the intestines suggests it. The chicks had indigestion and probably inflammation of the crop as well. The turkeys are dying of blackhead. There must be something wrong with your feeding and care. Have the birds clean ground to run on and plenty of greens? Are their houses clean? Are they getting a balanced ration? Chicks should have a growing mash before them constantly and hard grain in litter so that they will have to scratch for it if they are confined. Hens require a laying mash and a grain mixture once or twice a day amounting to about a quart for 15 hens. Above all, they must have clean water, grit and shell, and green feed at least once a day, twice is better. Sour milk before both hens and chicks is a great help. Hens that have been on a heavy laying mash need a lighter ration as warm weather comes on. It would be a good plan to add some bran to the laying mash, and drop all corn from the ration till fall. A teaspoon of Epsom salts for each bird, dissolved in water and used to moisten the mash, may help to prevent more fatalities. Two doses may be given a week apart. It is too late to do much for the turkeys, but you might try giving each of the sick ones a liver pill. Give all the onion they will eat. If you can put them on alfalfa for a while they will not need much else. If I knew what you have been feeding I could advise you more intelligently. Barley and wheat are the best grains for turkeys except at fattening time, and they should have a laying mash during the breeding season.

Care of Poults

Please tell me something about the care of baby turkeys in your next issue and also the names of books that will help me.—Subscriber, Van Nuys.

Baby turkeys must be kept warm and dry and free from lice, and they must have enough to eat, but not too much, and always some green with every meal. Most turkey breeders consider onions indispensable but there are a few who do not use them. Hard boiled eggs, very stale bread or rolled oats, young onions and alfalfa, put through a meat grinder, and a little grit (fine chick grit) added, is the nursery feed most generally used. The greens should be at least half the mixture, and one egg is sufficient for a day's feeding for 20 poults. This is fed three or four times a day at first. No one can tell you just how much to feed. The only rule is, "Keep them hungry." After a week or so sour milk may be set before them for a little while each day, and later on all the time, and a chick mash after three weeks may be given in the same way. They should be out on green range when it is warm enough from the very first, and if the range is well supplied with bugs and worms and succulent green, should, after a couple of months, get a good deal of their living from it. Rolled oats, dry mash, and always onion, with as much sour milk or cottage cheese as is available, are the standard feeds for the first two months. After this they may be given bran and barley in hoppers or the rolled oats diet may be continued. If a hen is used as mother she should be frequently dusted for lice, and if the weather is cold or wet must be confined where she will be compelled to cover her charges, which are more susceptible to cold than chicks. The Cultivator book, "Poultry for Profit," contains full directions for raising turkeys.

Overfat

One of my White Leghorns pullets, seven months old, was taken sick in the morning with watery diarrhoea accompanied by great weakness, and died before three o'clock. On cutting her open I found a dozen small egg yolks, her liver five times normal size and her heart double normal size and much bloated. She was very fat. What was her disease?—Subscriber.

Enlargement of the liver and fatty degeneration of the heart, apparently, but her overfat condition was at the bottom of it. It is rare that Leghorns put on so much fat, and I suspect a Minorca strain, especially as you say her legs were white. Probably she had a more fattening diet than she could stand. See that the other pullets, which are laying so well, do not get much corn the rest of the season.

One prominent city police judge says it is the duty of motorists to avoid pedestrians. The idea is new and novel, but possibly has merit.

If your business isn't worth advertising, advertise it for sale.

"THE BOSS" TREE PROTECTOR

We are the originators of the YUCCA PALM tree protectors and they have been on the market for 30 years. The color is light—a perfect protection against Rabbits, Grasshoppers, Heat of the Sun, Borers and Frost. It is quicker to put on than any other tree protector in the market. No strings to tie—ready for immediate use. Is open grained and allows free circulation of air. Can be readily taken off to spray the trees. Not affected by rain.

Cheap—Durable and Guaranteed to Give Satisfaction

We make all widths and sizes. Ask your Nurseryman about them or send direct to us for free sample and prices.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock April 26, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies liberal, market weak. Idahos: Russets mostly 2.35@2.50. Oregons: Burbanks 2.50. Washingtons: Round Whites 2.75. New potatoes: Supplies moderate, market weak, best 2.25@2.30, few 2.40, small 1.00@2.00 per lug, jobbing sales, best 2.00@2.15, few best 2.25 per lug. Sweet potatoes: Supplies liberal, market firm. Mostly 2.25@2.50 per lug. Oklahomas: 6½@7 per lb, jobbing sales 6 per lb.

Onions: Supplies heavy, market dull. Stocktons: White Globes, cold storage stock, 75@1.00; Browns, mostly 35@65 per cwt. sacked; local: per bunch, green mostly 12½. Coachella Valley; no sales.

Garlic: Supplies liberal, market dull. Wide range in quality and condition. Best mostly 10@13, poorer 7@9 per lb.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock April 26, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Best doz., 1.00@1.25; poorer wide range.

Asparagus: Market strong, supplies liberal: Local: Mostly 13@15 per lb. Northern, 11@14 per lb.; jobbing sales 11@13 per lb.

Beans: Supplies moderate. Per lb., Green Kentucky Wonders 32@33 per lb., green pods 17@21 per lb., Wax 17@20 per lm.

Beets: Doz., 30@40.

Cabbage: Field crate best mostly 1.15@1.35; poorer, 75.

Carrots: Doz., 35@40.

Cauliflower: Supply moderate, field cr., best, 2.25@2.50; poorer low as 1.25; few best high as 2.75.

Cucumbers: Hothouse, best, 3.00@3.25 doz.; poorer 2.75.

Lettuce: Local field crate quality poor, 1.00@1.25; best mostly 1.75; few high as 1.75.

Peas: Local: 5@6½ per lb.; few 7½; jobbing sales 4½@6 per lb.; few 7.

Radishes: 25@27 doz.

Rhubarb: Local strawberry 1.00@1.19 bx.; jobbing 90@1.00.

Spinach: Mostly 20; few best, 25 doz.

Squash: Summer, mostly 90@1.10; jobbing sales mostly 90; few 1.00.

Tomatoes: Mexican, per lug, best 4.00; repacked lug, 4.25; Imp. Valley crates small to large 2.75@3.25; jobbing 2.50@3.00.

Turnips: Doz., 40@45; few 50.

FRESH FRUITS

Strawberries: Supplies increasing, market weak. Per crate, 30 pints, best 4.00, few fancy 4.25@4.75, No. 1 3.50@4.00, No. 2, 2.75@3.00.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.50, special packed brands 2.75@3.25.

Lemons: Supplies heavy, market dull, wide range in prices. Local: packed box 1.50@2.25, few high as 2.75, loose 75@1.00 per box, per lug mostly 40@50.

Oranges: Supplies heavy, market firm. Navels, market pack, large sizes 3.00@3.50 small low as 1.75, special brands, small sizes 3.00@3.50; large sizes 4.00@4.75. Packing house culls 25@50 per box, few best 75@90; Tangerines: Supplies liberal, market steady, lb. best, 6@7½; small 4.

HONEY

Supplies of honey are still generally heavy, but old crop is cleaning up in some sections. Poor wire inquiry. Movement slow, market weak. Carloads f. o. b. usual terms: Per pound, few sales of White Orange Blossom 12½@13; White Sage 12@12½; light Amber Alfalfa 6@6½; Light Amber Sage 7½@8½; White Alfalfa 7½@8; Hawaiian White 7; Light Amber 6; Honey Dew 4½. Producers are reported as offering contracts for new crop. White Orange Blossom 10 per lb., but buyers are holding off. Prospects for the honey crop are generally favorable throughout the state, except in the San Diego district and Salinas Valley, where rainfall has been very light. Darker grades of honey are now on cheap price basis and competing with sugar for commercial use. The outlook is for a continued downward trend in prices for the darker colored stock.

GRAIN AND FEEDS

Grain Exch. price bid April 26:
Wheat: Mixed feed Utah-Idaho, 28.25.
Corn: Bulk, No. 2, Yellow, 1.60.
Bran: Kansas, 28.25.

HAY

Alfalfa Growers of California report under date of April 25:

The markets for grain and feeding stuffs reached new low levels during the week under the influence of which the market for alfalfa continued dragging and inactive. It would seem as if in consequence of the apparently endless decline in the prices of all farm products prices had ceased to be a factor in the demand; in fact, the lower prices go the more buyers become frightened and timid, and the less they are inclined to buy beyond their most immediate needs.

There were 260 tons received on the Los Angeles tracks the week ending April 23 with 30 tons held over as against 600 tons the week before.

Rabbit Alfalfa	25.00
No. 1 Dairy	21.00
Standard	18.00
Stock	15.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	20.00@30.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	20.00
Standard	14.00@16.00
Straw	10.00@13.00

The Glenn-Colusa irrigation district has turned water into its distributing canals. Rice planters are getting in their seed very early this season.

San Francisco Markets

San Francisco, April 26, 1921.

Kafir: Eastern, 1.45@1.55.

HAY AND FEED

Alfalfa Growers of California report under date of April 25:

No. 1 Dairy	18.00
Standard Dairy	16.00

Under date of April 23, A. W. Scott Co. says:

Receipts past week 875 tons as compared with 700 tons preceding week. Although receipts continue light they seem to be ample for all requirements, and there is practically no change in figures in any of the hay lines. Increased activity in farm work is interfering somewhat with hay movement both into local market and through the interior. A strong opinion on the part of the farmer that there will not be any great carryover of hay but that there will be demand to clean up his holdings sooner or later also has an effect of keeping country trading quiet and reducing the volume of shipping. The view of the old crop appears more favorable than that facing the new.

General conditions appear to be improved. Trading is more active and there is a little better local inquiry for hay and feed of all kind. An increase of building has indirectly helped our market and in general there is better tone than for some time.

Reports and indications are that conditions have been excellent all over the state; that an exceptionally large acreage will be cut for hay of which an unusual proportion will be of volunteer and possibly barley. Growing alfalfa is in an ideal condition as a whole and these indications of abundance together with the immense carryover stocks in some surrounding states leads one to believe that the surplus will exceed by far any possible demand at the time of the new harvest.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Tame Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00

Citrus Markets

Los Angelees, April 27, 1921.

Shipments are now going forward in excess of 200 cars daily, in fact nearly 1,500 cars weekly.

Prices are stiffening and very satisfactory condition prevails.

Lemons are likewise showing slight improvement. Sales are very limtied and importation is large.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 18,651 cars; lemons, 3,825; total, 22,476. To same date last season: Oranges, 15,134; lemons, 2,911; total, 18,045. From Central California to date, this season: Oranges, 4,684; lemons, 132; total, 4,816. To same date last season: Oranges, 4,304; lemons, 286; total, 4,590. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last sesaon: Oranges, 261, lemons, 22; total, 283.

Best Tracklayer Farm Tractors are built in two models: the Tracklayer "Sixty" and the Tracklayer "Thirty." The lower picture shows the "Thirty." Just above it is the "Sixty."

Tracklayer Tractors are *factory Built*—not assembled. Some of the accessories are bought, but the vital and important parts, including the motor, are built at the Best factory to fit perfectly into the Best proved tractor design.

Cutting the Corners On Farm Costs

THIS year farmers are serious as never before on the question of real constructive farm economy. Corners must be cut—not by skimping and makeshift, but by avoiding waste and unnecessary or duplicating operations, by getting through the usual jobs by the shortest route, by doing them better, quicker, and more thoroughly.

It is true that a *good* tractor is one of the farmer's greatest and most dependable helps in economic farming. Best Tracklayer Tractors, for instance, can be thrown into the fields and orchards at precisely the right time for maximum crop results. Soil preparation will be done in fast, unfaltering time and at the proper depths. The work will be thorough and uniform. You have saved time and money and hired help which is profit. When not in the field the Best can be put at a hundred and one jobs of belt work and save hired help and labor.

Your investment in a Best this season is doubly wise—because of immediate economies effected, and because it covers many years to come without thought of replacement. Best stamina, long-life and low operating cost have been established beyond any doubt.

Write at once for catalogs and full information, and the name of our nearest dealer.

BEST TRACKLAYER TRACTORS

The American Housewife—Insures the Success of Your Orchard

AN OPEN LETTER TO FRUIT GROWERS:

Do You Realize—

- that there are fifteen million -- and more -- of good housewives east of the Rockies, feeding 80% of one hundred million people?

- that every one of these housewives is striving to improve the dietary of her household, and increase its wholesomeness, consistent with economy?

- that the fruit foods you produce can be used green, dried or canned as staple food in innumerable ways, ECONOMICALLY, and at a SAVING IN LABOR?

- that every one of these housewives has an intense, romantic interest in California and your products?

- that of these fifteen million housewives, the great majority do not employ any one of the numerous California Fruit Foods excepting on rare occasions, and many never?

- that not one out of a thousand of our very best housekeepers is AWARE OF THE INNUMERABLE uses in which every one of our staple California Fruit Foods can be employed economically, as well as wholesomely?

In our own household, consisting of the writer, Mrs. Bergtholdt and half a dozen of assorted sizes and ages, Mrs. Bergtholdt employs annually on the family bill of fare, approximately fifty pounds each of Almonds and Walnuts, ten gallons of ripe olives, several hundred jars of jams, jellies and preserved fruits, as well as 150 pounds of Raisins, Prunes and other dried fruit, ten to fifteen boxes of Apples, eight to ten boxes of Oranges, four or five boxes of Grape Fruit, and throughout the Summer and Fall months all that we can consume of other fruits in season. She does this economically. She does this at A GREAT SAVING IN LABOR. Every article used is not alone NUTRITIOUS and WHOLESOME, but APPETIZING.

Do you realize that a book, "THE STORY OF CALIFORNIA FRUIT FOODS," placed in the hands of every housewife can be made the connecting link that would eventually make the 120 million people in the United States and Canada daily consumers of the products of your orchard?

THIS BOOK, EDITED BY THE BEST EDITORIAL WRITERS, HANDSOMELY ILLUSTRATED, AND CONTAINING INNUMERABLE RECIPES COMPILED BY THE BEST CHEFS WOULD NOT ALONE BE INTENSELY INTERESTING AND INSTRUCTIVE, BUT WOULD BE AN INDISPENSABLE NECESSITY TO EVERY HOUSEWIFE.

This book should be printed in several foreign languages for the purpose of developing the consumption of your fruit products among the foreign born people of our own land who are economically prosperous, and to be used also in exploiting the consumption of your fruit products in the markets reached by the export trade.

Every kind of fruit and nuts grown in your orchards should be given space in this book, according to the volume of the individual branch of the industry.

The initiative should be taken by, and this proposed plan be put under way by your various co-operative fruit marketing and fruit manufacturing organizations.

The organization to put this over should be comprised of representatives from the organized branches of the industry.

Inasmuch as every man, woman and child in California will be directly benefited from the assured prosperity of your orchards, a drive should be made to enlist the financial support of every commercial body in every city, town and county in the State.

SOME OF THE MARKETING ORGANIZATIONS ARE PUTTING FORTH COMMENDABLE INDIVIDUAL EFFORTS IN ADVERTISING YOUR PRODUCTS. THESE SHOULD BE CONTINUED. THIS, HOWEVER, IS NOT SUFFICIENT.

DO YOU REALIZE, MR. FRUIT GROWER, THAT THE AMERICAN HOUSEWIFE IS RIGHT AT YOUR DOOR, READY AND WAITING TO CONSUME YOUR PRODUCT IF YOU WILL BUT SHOW HER HOW TO DO IT? "THE STORY OF CALIFORNIA FRUIT FOODS" IS THE CONNECTING LINK. DO THIS AND WITHIN TEN YEARS YOU WILL HAVE CREATED A DEMAND THAT EVERY ACRE ADAPTED TO FRUIT GROWING IN CALIFORNIA, PLANTED TO FRUIT, CANNOT SUPPLY.

Done collectively by all branches of the industry, the burden of cost will be infinitesimal.

The increased proceeds each year from the sale of your products will amount to more, by several times, than the expense of the undertaking.

The value of your orchard properties and every acre of fruit land in the State will, in ten years, be enhanced many, many times the expense of the undertaking.

Every factor engaged in the distribution of your products would be an agency to co-operate in placing a copy of this book in the hands of every housewife.

The funds can be provided, the work under way and the distribution commenced within a year, so that you can begin to realize from the benefits of the first distribution of this book on your crop of 1922, and within a period of four years, at most, a copy of this book can be placed in the hands of every housewife.

MY MESSAGE TO YOU IS THIS: IF YOU WILL EXERCISE THE INITIATIVE AND THE COURAGE TO CARRY THIS PLAN OUT AND PUT IT OVER RIGHT, A DEMAND FOR YOUR PRODUCTS WILL BE CREATED THAT WILL ABSOLUTELY AND PERMANENTLY INSURE THE PROSPERITY OF THE FRUIT INDUSTRY.

There never was, nor is there now, an over-production of fruit; and there never will be if you employ THIS MEASURE OF CONSTRUCTIVE COMMON SENSE in instructing the people of America in the merits and use of the products of your orchards.

When the writer made his first venture in fruit growing on an investment of seventeen summers, a roll of blankets and a husky desire for a job, the old pioneer who then employed him punching mules advised him to keep out of the fruit business; that there was an over-production. I have heard this reiterated many times since. During these years, the production of California fruit has increased tenfold.

My friends called me optimistic in the recommendation that I have made for their planting and in the advice that I have given. An optimism, however, that has led to the planting of several thousand profitable orchards throughout California, IS BASED ON SOUND LOGIC.

I am not writing this to sell trees. Every word of this message COSTS US GOOD MONEY. The success of the California fruit industry has been and IS MY ONE WORK, and because we, ourselves, aside from our nursery business and fruit shipping, have over 1,300 acres in orchard.

It is up to you, together with ourselves, to put this over.

Take this up for action at your Farm Bureau. Write the editors of your horticultural publications. Write the management of the marketing organizations with which you are connected. Urge them to co-operate with you and with every factor in the fruit growing business to put this over. Put your shoulder to the wheel, and keep it there -- don't let go -- hang on -- pull hard with me until we get an organization to work that will put this over.

For many months I have discussed this project with my wife. She has named it the "Bergtholdt Plan." Talk it over with your wife.

I WANT 25,000 OF YOU FRUIT GROWERS TO WRITE ME WHAT YOU THINK OF MY PLAN. YOUR COMBINED 25,000 OPINIONS ON THIS VITAL ISSUE, COMPRISING THE BEST THOUGHT OF 25,000 INTELLIGENT FRUIT GROWERS, WILL, BOILED DOWN, FURNISH IDEAS AND SUGGESTIONS INVALUABLE TO THE ORGANIZATION THAT WILL BE CREATED TO PUT THIS OVER.

If you will do this, and by this means employ the connecting link -- "THE STORY OF CALIFORNIA FRUIT FOODS" -- between your orchard and ours and the American housewife -- your success in fruit growing, and ours, will be assured.

So GET BUSY.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The little fellows waiting for the early worm on the cover are representative of one of the biggest small businesses along productive lines in California. They mean something over $50,000,000 annually to the state. The war and reconstruction have combined to place the industry in a rather embarrassing position, but it is pulling out, and the story, "Brooding by Thousands," written by Mrs. Koethen, gives an idea of how some of the Cultivator's subscribers are staying by the producing game and another fall will see hundreds of carloads shipping to New York and other large centers.

* * *

Nearly 20 years ago farmers of Pomona Valley found themselves unable to make satisfactory arrangements with the telephone system and organized a mutual telephone company. A few items regarding that organization, reminiscences of those connected with it, will be given next week in an account of one of the first and most effective farmers clubs ever organized in Californa. But there happens to come to our desk from the California state railway commission a bit of information as to the present condition of this cooperative organization of a score of years. The commission reports: "The Pomona Valley Telephone and Telegraph Union operating in Pomona, Claremont, Chino and vicinity, reports to the railroad commission for the year 1920 that its operating revenue was $107,466.31; operating expenses $90,447.16, giving a net operating revenue of $17,019.15. Miscellaneous non-operating revenue amounted to $81.31. Interest, rent, taxes and other deductions totaled $12,764.32. The net corporate income for the year was $4,336.14. The surplus at the beginning of the year amounted to $3,000. Miscellaneous additions to surplus for 1920 amounted to $6,663.86. The company declared dividends of $14,000 during the year."

* * *

The quotation from the address of Prof. Jaffa may have a forbidding appearance to some readers. It is a bit long on "vitamines," "anti-scorbutics," "anti-neuritics," "trypsins" and a number of other extractions from the dictionary. But we Californians are in a campaign to inform the world how to eat—California foods. So we must post up.

* * *

An international fruit show is scheduled to come off in Chicago in October. It is reported that "more than 100,000 fruit men of the United States are back of this show." We should see such a gathering of fruits as has never been brought together. Dispatches say: "Orchardists throughout the entire North American continent are whole-heartedly supporting the exposition. Among the organizations that have approved the plan are: California Fruit Growers Exchange, Oregon Cooperative Fruit Association, both associations of the California raisin and prune growers, Virginia Fruit Growers, Inc., Florida Citrus Exchange, Ozark Fruit Growers Association, National Grape Growers, Peach and Fig Growers Association, Western New York Cooperative Association, Skookum Packers of Washington and Indiana Fruit Growers. Horticultural societies, manufacturers of orchard implements and other organizations allied to the fruit industry also indorse the plan. The National League of Commission Merchants and the Western Fruit Jobbers will help make the show a success." It is seen that California organizations loom large in the plan, though apparent effort is made to reduce "California" slightly by leaving off the names of some of the organizations

MUST HAVE LOWER RATE

California citrus growers will pay over eight and a half millions of dollars more for transportation on this year's citrus crop than on that of last year. That is, they will providing the fruit will sell for enough so that it may be shipped at all. The recent 33 per cent advance in freight rates means that California citrus fruits will pay out in transportation charges approximately 40 millions of dollars and it has proven a serious blow to the industry. It will prove its death, at least the ending of the lemon industry, unless relief may be had.

Relief was asked of the railway officials. It was refused. The interstate commerce commission was appealed to by the California state legislature through a resolution introduced by Senator King. A hearing has been granted and Special Representative Henry J. Ford is in the state. The hearings began last Tuesday with the citrus interests presenting their case. The initiative has been largely with the citrus interests, yet as present rates on practically all Coast fruit and vegetable products are proving serious handicaps, the effort will be a united one to secure more just treatment.

Under the old time "All-the-traffic will-bear" regime a very high freight tariff was placed on all perishable high priced products. This original high price has now been pyramided by two percentage increases in a way to increase the injustice. President Teague brought this out most forcefully in his testimony before the commission's representative. Mr. Teague demonstrated with tables as to producing costs and, with other tables as to shipping costs furnished by Mr. Dezell, that the net loss to lemon producers has been $1.26 for every box shipped—this loss not including interest on investment, neither depreciation on trees.

It is to be hoped that the commission may assemble the facts presented and act quickly, for the lemon producer has clung to false hopes so long, meanwhile bearing up under continued loss, that his strength is exhausted and already the ax has been laid at the root of many an orchard which has taken years to produce.

STATE OF CALIFORNIA

Executive Department
Sacramento
Forest Protection and Fire Prevention Week

Proclamation

Whereas, The forests of California, with proper care and protection from fire, will supply by their recurring growth for generation after generation the needs for timber of all of our citizens; and

Whereas, During the summer of 1920, forest, brush, grass, hay, and grain fires devastated 415,275 acres in California, causing a direct monetary loss estimated at $983,562; killing young trees the value of which 50 years hence, can not be estimated; destroying pasture that should have fed hundreds of cattle, sheep and horses; denuding watershed areas of growth needed to conserve water from winter storms for summer irrigation and electric power purposes; leaving barren waste in place of sylvan beauty; and

Whereas, With our growing population our forests are becoming more valuable, both for timber and for the enjoyment and recreation of our populace and tourists from other states; and

Whereas, By reasonable care and protection this great loss can be greatly reduced, our forests preserved, our hay, grain, and pasture conserved,

Therefore, I, William D. Stephens, Governor of the State of California, do proclaim the week, **May 22 to 28, 1921, Forest Protection and Fire Prevention Week,** and call upon all of the citizens of California to pledge themselves to exercise watchful care against the starting of fires, either in forest, pasture, or grain areas and to extinguish them promptly when by mischance they do occur, knowing that so to do is to perform one of the most important services that can be rendered to the present and future welfare of our State.

Let teachers observe the week by impressing upon our boys and girls this duty.

Let ministers instruct their congregations.

Let associations such as the Boy Scouts, Farm Bureaus, patriotic and benevolent societies, Chambers of Commerce, Women's Clubs, and the like join in this crusade to protect ourselves and our posterity.

Let the railroads take all steps needful to prevent or extinguish fires along their rights of way.

Let lumbermen leave no fire traps after logging.

Let fishermen and all who use the forests or countryside for health or recreation see to it that their fires are kept safe and that carelessness does not endanger that which they enjoy.

Let all citizens adopt as their slogan for this and succeeding years, **"Help Prevent Fire,"** and thus preserve the beauty and wealth of our beloved State.

(SEAL) WM. D. STEPHENS, Governor.

ADVERTISE OUR FRUITS

J. E. Bergtholdt suggested in the last issue of the California Cultivator that he would like to hear from 25,000 fruit growers as to what they think of his plan of telling all the world "The Story of California Fruit Foods." He wants this book to contain a world of information about the products of the world's most famous fruit producing state. His ambition is so great that he wants these 25,000 letters which he thinks will contain boiled down ideas and suggestions invaluable to the fruit interests. Not only does he want the letters but he is suggesting that farm bureaus and other farm organizations discuss, suggest and help put over the greatest campaign yet contemplated for making known the real value of California fruit foods. Mr. Bergtholdt has the idea that the demand can be created which will not only wipe out any surplus now in canntries and storehouses but will increase until other acres must be brought under most intensive culture to produce the world's finest. The Cultivator takes pleasure in adding to the information regarding the healthfulness and even necessity of using fruit foods more liberally in our diet by quoting from an address made at Claremont by Prof. M. E. Jaffa. This address appears on third page of this issue. It contains data which will, we believe, be surprising even to enthusiastic California fruit growers and we believe that address should be largely drawn upon in conveying to the 15,000,000 housewives of the country the information which Mr. Bergtholdt wants packed into "The Story of California Fruits."

WELL ADVERTISED

Mr. Bergtholdt's idea is to present a scheme which will aid all campaigns now being conducted in advertising California products. California farmers are spending far more than a million a year in advertising California products in Eastern magazines. The citrus growers started the campaign nearly a decade ago and they have thrown millions into it. The raisin growers, the walnut growers, prune, apricot, peach, almond and olive growers have each shown the helpfulness, attractiveness and even necessity of their own products in every well regulated diet. Especially to be admired is the Sun-maid raisin campaign. It has supplemented its magazine full page advertising in natural colors with fine hangers, window cards, circular material and, perhaps most effective of all, illustrated booklets and recipe booklets. Here is a fund of information taken from its most recent publication:

"The raisin is one of the most important of the energy producing foods of man because of its high percentage of carbohydrate. This carbohydrate, which forms 75 per cent of the edible portion of the raisin, is in the form of grape sugar or fructose, and levulose, both of which are practically predigested in nature's laboratory and therefore ready for assimilation. One pound of raisins has an energy producing food value of from 1,550 to 1,605 calories, or approximately 100 calories to each ounce of the edible portion. Its protein value, according to analyses of the most noted dietitians, is 2.6 per cent, and the percentage of its acids, which are important in the process of digestion and assimilation, 2.7 per cent.

"The value of the raisin as a food is by no means confined to its percentage of carbohydrate, for analysis of the ash shows that it is rich in many of the elements essential to health. The raisin contains calcium, magnesium, potassium, sodium, phosphorus, chlorine, sulphur and iron in form ready for prompt assimilation. Raisins form an important part of the dietary in some of the leading health institutions of the country and in several noted sanitariums are prescribed specifically in certain cases. The raisin is the richest of dried fruits in the mineral elements of iron and phosphorus and but very few of the fruits and vegetables contain a larger portion of organic iron, lacking to greater or less extent in many American dietaries."

Such material as this will help us to greater appreciation of the value of the raisin and, we believe, induce us to say: "It tastes like more."

Fruits and Nuts: Then and Now

An Address by Prof. M. E. Jaffa Before Claremont Pomological Club

The Claremont Pomological Club held its 25th anniversary celebration and memorial to its founder, Dr. A. J. Cook, last Saturday. Review of the club and of the life of Dr. Cook will be given in next week's Cultivator.

One of the addresses given, not connected with the history, was made by Prof. M. E. Jaffa. Much interest has been created by investigations during the past few years as to certain principles in nutrition which are in effect that chemical analysis may not show real value of all foods, for there is a mysterious something in milk, eggs and other foods requisite to highest physical development. Professor Jaffa has been making investigations and reports as to the advantages of fruits and nuts in this particular.

We quote so freely from the address that it will be given in part this week and the remainder next week.

THE nutritional knowledge of fruits 25 years ago might well be summarized by quotations from the introduction and conclusion, respectively, of Bulletin 107, Office of Experiment Station, U. S. D. A., published in 1901 on Nutrition Investigations Among Fruitarians, at the University of California.

Introduction. "Fruit is considered by the majority of persons as an accessory or supplementary food, eaten for its agreeable flavor or supposed hygienic or medicinal virtues, rather than as a staple article of diet. Perhaps for this reason very little scientific study has been given to fruit as compared with the investigations which have been carried on in connection with other more common food materials. Chemical analysis has shown the comparative composition of fruits, but our knowledge of their dietetic value, digestibility, and comparative cost as sources of nutrients is far from being complete. In view of these facts it has been thought best that California should undertake, as her share of the nutrition investigations made under the auspices of the United States department of agriculture, studies of the nutritive value and digestibility of fruit. Perhaps no state in the Union is in better condition to exploit such problems. No month in the year finds the California market without fresh fruit of local production, and many people are to be found in the state who make this article an important part of their dietary."

Conclusion. "No extended comments can be made on these results, because, as before stated, there are few, if any, similar investigations at hand for comparisons. Further investigations along this line are needed."

The further investigations suggested were carried on in 1902-3 at the University of California with most satisfactory results, and two paragraphs from the summary would seem quite pertinent:

"Although it is undoubtedly advisable to wait until more data have been gathered before making definite statements regarding the digestibility of different fruits and nuts, enough work has been done to show that they are quite thoroughly digested and have a much higher nutritive value than is popularly attributed to them. In view of this it is certainly an error to consider nuts merely as an accessory to an already heavy meal and to regard fruit merely as something of value for its pleasant flavor or for its hygienic or medicinal virtues.

"As shown by the composition and digestiiblity, both fruit and nuts can be favorably compared with other and more common foods. As sources of carbohydrates, fruits at ordinary prices are not expensive; and as sources of protein and fat, nuts at usual prices are reasonable."

It will be noticed that only the carbohydrates of fruits are emphasized, no mention being made of any other nutritional value. In order to thoroughly understand how much more complete is our knowledge of fruit and nuts today than it was in 1902 it will be necessary to briefly review the progress nutrition has made since that year.

Fruits and nuts should be considered as dietary essentials, not as food accessories or luxuries. They therefore should be classed, nutritionally, as important as other staples ordinarily found in the menu.—Prof. M. E. Jaffa.

At the close of the 19th century our evaluation of a diet was based on content of protein, content of fat, content of carbohydrates.

If a diet contained sufficient protein, in addition to the necessary fat and carbohydrates, to meet the caloric requirement it was considered well balanced, without regard to the sources of the respective nutrients. Today we have a different yardstick and measure quite differently. We realize, as we did a quarter of a century back, that calories are vitally necessary, but we pay more attention to the sources of the required calories. This is particularly true in the case of the young and growing child and of the invalid convalescent.

Perhaps the only theory of nutrients which has not been affected by later ones is as to the starch or carbohydrates of our foods. The same opinions which were held years ago with reference to the role of starch in nutrition are valid today. Not so, however, with reference to any other nutrient. We know today that proteins from different sources have different biologic values. The proteins from cereals, fruits and vegetables alone are not adequate for optimum growth and development. These proteins lack sufficient amounts of certain building stones or units of structure, chemically called amino acids, which are well supplied by animal protein, such as that of meat, milk and eggs. It is therefore absolutely necessary that there be a liberal amount of animal protein included in the diet of the young, growing animal.

The newer knowledge of the proteins has only been obtained during the past, say, 15 years. The initial step in the great progress that has been made in the realization of the biologic values of the different proteins was taken in 1901 when Cohnhein discovered the ferment erepsin in the small intestine. Previous to that date it was considered that the last ferment to act on the proteins in the digestive tract was trypsin. It is of interest to note that physiologists were unable to bring about artificially complete digestion of the proteins with trypsin alone. It was a simple matter to conduct artificial digestion experiments with pepsin, which more or less corresponded to what went on in the stomach, but in the case of trypsin it was different. It was known that digestion in the small intestine was completed within a reasonable length of time, but in the case of artificial digestion experiments weeks were required to accomplish the same result with trypsin. This gave rise to the theory that the proteins were not hydrolyzed in the intestines into the simple cleavage products such as amino acids or units of structure, but were absorbed from the intestines as peptones and albumoses. These are protein compounds intermediate between the complete protein as ingested, and the cleavage products, the amino acids. The finding of the specific enzyme erepsin in the small intestine has greatly changed the views concerning intestinal digestion and protein absorption as well. Erepsin breaks down with great speed the partially converted proteins or peptones, the products of pepsin and trypsin digestion, into the units of structure, or amino acids. In other words, it is quite clear how different animals can build up their respective typical proteins as results of the cleavage or hydrolysis of the same identical protein.

Not only have great strides been made with reference to the fuller appreciation of the value of proteins but also in connection with the biologic values of different fats. A quarter of a century ago all fats were considered of equal nutritional value and their main function was to build fatty and nerve tissue or yield energy, and practically no other nutritional property was credited to them. Today the situation is entirely different and we now know that all fats have not the same biological value, that there are two food fats, that of milk and egg yolk, which stand out most prominently as far as nutrition is concerned, in that they both contain the so-called fat-soluble vitamine. This is a dietary essential at present not identified but absolutely necessary in any well balanced diet for old or young, and particularly the latter. There are many other edible fats which are the equal of butter fat and egg yolk fat as far as caloric value is concerned but they are not the rich source of this dietary essential as is noted for the other two fats.

One of the most important phases of the newer knowledge of nutrition gained during the last 20 years relates to the importance of mineral elements in nutrition.

For many years it was considered that as far as the mineral matter was concerned almost any diet was adequate and very little attention was, therefore, paid to the role of the mineral ingredients. Today, however, as a result of nutritional studies we note that our previous views and opinions were not sound and that more consideration should be given to the mineral matter of the diet than was previously supposed necessary. It is now known that cereals alone are deficient in certain minerals such as sodium, calcium and chlorine, required for growth and normal development in the young animal. Again we know that as a result of the work of recent years the mineral matter of our foods may be divided into two main groups, the "acid forming" and the "base forming." It is absolutely necessary, according to the best authorities, that there be a generous representation in the diet of both these groups in order that the mineral equilibrium of the body should not be altered and the alkalinity of the blood be not disturbed.

The chief foods which furnish the "acid forming" mineral elements are cereals, meat and eggs, while those supplying in the main the base forming minerals are the fruits and vegetables.

Mention has been made of milk fat and egg yolk fat containing vitamines. During the past ten years much work has been done by leading nutrition investigators in connection with studies of vitamines and their role in nutrition. The question the layman might naturally ask is, "What is a vitamine?" It has been known for many years that there exist in fresh food some substances which are essential for the prevention of scurvy. These are called by some "anti-scorbutic substances." Beriberi is another deficiency disease which can be prevented by a diet adequate in anti-neuritic substances, so that we have two substances, anti-scorbutic and anti-neuritic, present in foods which are evidently curative for these two diseases. Naturally there was a desire on the part of many investigators to quantitatively separate these materials from the foods. Funk and his collaborators, however, devoting much time and energy to the problem, succeeded in 1912 in devising a method which led to a product of high physiological activity and curative powers. To this preparation Funk gave the name "vitamine," from "vita," life, and "amine" meaning a substance essential to life.

(To be concluded next week.)

Agricultural News Notes of the Pacific Coast

Northern California

Sebastopol apple growers report very heavy bloom.

Nevada County reports less damage to pear crop from frost than was at first feared.

Experimental plantings of cotton will be made near Redding, Shasta County, this year.

Napa County boys and girls have organized a club for the commercial growing of popcorn.

The postoffice in Feather River Canyon, formerly known as Cedar Glenn, is now Tobin.

Santa Clara County Farmers Union will hold its annual picnic at Odd Fellows Home, Saratoga, June 11.

The poultry housing and feeding demonstration at Hayward, Alameda County, is ready for operation.

El Dorado County farm bureau has been operating a cooperative meat packing plant since February.

Three farm bureau centers in Napa County are now enrolled in a meat ring which kills and distributes meat to members.

The entire lot of 180 hogs offered at auction by the Durham farm center was secured by a local buyer at $9.25 and $9.40 per hundred.

The Solano County farm bureau has appointed a committee to look into the feasibility of building elevators for bulk handling of grain.

The county horticultural commission has distributed a large amount of gopher poison in Sonoma County in a concerted drive against the pests.

The California Farm Bureau Exchange has formed a permanent body with J. A. Teagarden, Auburn, president, and B. D. Irvine, Brawley, Secretary.

Chico, Butte County, reports more than 850,000 sacks of rice, unharvested because of fall and winter rains, has now been gathered into valley warehouses.

Farm bureau meetings in Glenn County: Codora, May 9; Orland, 11; Jacinto, 13; board of directors, Willows, 14; Capay, 18; Plaza, 20; Grapevine, 25; Larkin, 27.

The California Prune and Apricot Growers, Inc., is pushing its membership campaign. 23,700 acres under control of the association is the present aim of the management.

Rice millers of Butte County have filed joint complaint with the state railroad commission against the railroads to recover excess charges made since 1917, running into hundreds of thousands of dollars.

Quincy, Plumas County, reports organized movement to secure early building of a North Fork highway through Feather River Canyon. Promotion units are being formed in towns along the route.

County Horticultural Commissioner H. H. Sherrard reports: "The recent survey of Tuolumne County shows that there are at present 713 acres of apples, 124 acres of pears, 94 acres of peaches, 65 acres of walnuts and chestnuts, 257 acres of clover, 373 acres of alfalfa, 72 acres of potatoes and 36 acres of berries. This survey has been quite thorough and these figures are about as accurate as can be secured."

Central California

April 29 and 30, Raisin Festival at Fresno.

Stanislaus County has 413 acres planted to olives.

Sheep growers of Livermore Valley report good demand for lambs.

Pajaro Valley Poultry Show was held last week at Watsonville.

Livermore Valley stockmen are beginning to send grass cattle to market.

The entire bond issue of the Modesto irrigation district has been sold at $98.10.

A branch office of the Fresno County farm adviser has been opened in Selma.

The reorganized California Milk Producers Association has over 1,800 dairymen stockholders.

Farmers at Patterson, Stanislaus County, report that they are unable to get help for haying.

The state senate has passed a bill authorizing establishment of a state normal school at Stockton.

The Stockmen's Protective Association held its annual meeting at Livermore, Alameda County, May 1.

The Tulare cannery of the California Cooperative Canneries will not operate this year if rumor is correct.

County Agent Jungerman of Stanislaus County is urging all growers of peas to keep close watch for aphis.

Kern County has planted nearly 5,000 acres to vineyards this season; 3,276 acres are planted to Thompson Seedless.

Announcement is made that the California Peach Growers is to make a first payment of $50 per ton on the 1920 fig crop.

Manager Young of the Grand View packing house in Tulare County estimates that his house will send out 60 carloads of Valencias.

J. McPhaill of Visalia has been appointed cattle brand inspector for Tulare County, representing the state office for cattle protection.

The farm bureau of Monterey County has arranged a schedule of wages for farm laborers. General farm labor is $2.50 per day of ten hours.

Tulare County members of the Poland China Breeders Association held a meeting and banquet at Tulare recently and arranged for exhibits at the fall livestock show.

Farm bureau meetings in Kern County: Delano, May 9; Wasco, 11; Rio Bravo, 12; Edison-Fairfax, 13; Mountain View, 16; Pond, 18; Inyo-Kern, 19; Rosedale, 20.

The Stanislaus County members of The California State Irrigation Association held a special meeting at Mcdesto, April 30, to discuss both irrigation and power situations.

Horticultural Commissioner Beers of Merced says that it will be necessary to replant most of the cantaloupe crop in that county because of the frost damage to the young plants.

Local meetings of the San Joaquin County farm bureau will be held at Nile Garden, May 6; directors meetings, Stockton, 7; Lockeford, 9; Tracy, 10; Linden, 11; Douglas, 12; Escalon, 16; Ripon and Live Oak, 17; Bruella, 18; Summer Home, 19; traveling conference, 23-28; Calla, 27.

Southern California

Valencia Orange Show, Anaheim, May 17-22.

Palo Verde has been given a 25 per cent freight reduction, effective May 12.

Carpinteria, Santa Barbara County, held its eighth annual flower show, May 3.

Squirrel poison campaign has been very successful in San Luis Obispo County.

Dates of the San Fernando Valley Fair and Market, Owensmouth, September 14-17.

Santa Barbara County farm bureau held its annual farm picnic at Santa Ynez, April 30.

Colton, San Bernardino County, will hold its first annual Community Festival, May 23-28.

Ventura County beekeepers report prospects for very light crop because of deficient rainfall.

Orange County farm bureau will hold its annual picnic at Orange County Park, May 14.

The Riverside County farm bureau has approved a schedule of wages for orator demonstrations.

The San Fernando Valley Fair and Market committee is working on its premium list for the fall fair.

San Bernardino and Imperial Counties have been making concerted fight against squirrels and gophers.

Burning of a large woollen mill at Long Beach caused property loss of hundreds of thousands of dollars.

One cheerful aspect of the April frost is the killing back to the roots of Johnson grass in several localities.

Imperial Valley feeders are bringing in large numbers of cattle from dry sections of Arizona and New Mexico.

Apricot growers of Orange County are generally signing up with the California Prune and Apricot Growers, Inc.

The San Fernando Valley Walnut Growers Association held its annual meeting at its warehouse, Monday, May 2.

The Inman bill prohibiting Japanese from fishing in "deep waters" off the coast of California has been passed by the legislature.

The Riverside County farm bureau has approved a schedule for wages for farm labor. Unskilled labor will receive 35 cents an hour.

Beekeepers of Orange County held a field demonstration Saturday, April 30, under direction of Prof. Ralph Benton of the state college of agriculture.

Choice recleaned Limas are selling at $5.50 to $5.60; choice recleaned Baby Limas, $4.75 to $5.00, with growers hoping that the bottom has been reached.

Imperial County farm bureau meetings: Seeley, May 9; New River, 10; Lantana, 11; Westmoreland, 11; Mesquite Lake, 12; Jasper, 13; McCabe, 18; Mount Signal, 19; East Side-Sunset, 20; Alamitos, 23; Alamo-Verde, 25; Central-Highline, 26.

Philo Jones estimates 24,000 acres of grain in the Brawley district in a strip running from three miles south of Brawley to seven miles north and extending across the valley. Light yield is expected on land planted last year to milo and cotton.

The Coast and General

Verde Valley cattle owners are planning a big round-up to move the bulk of their cattle to the Mogollon rim. The drive will start about May 15.

An effort is being made to have the miners in the Globe district of Arizona employed on the new Superior-Miami road which is to be built under the direction of the state highway department.

Dwight B. Heard, publisher of the Arizona Republican, and prominent in agricultural and civic matters, is representing the Arizona Cotton Growers Association in Washington in an endeavor to have a tariff placed on Egyptian Long Staple.

Experiments are being continued at the experiment farm at Mesa, Arizona, to determine the feed value and use of whole cotton seed as feed for fattening steers. Alfalfa hay and silage are used for roughage.

W. S. Stevens, president of the Arizona American Egyptian Cotton Growers Association, and Charles M. Morgan, secretary of the Pima Cotton Growers organization committee, were appointed delegates to the cotton conference at Oklahoma City.

B. A. Fowler, organizer of the Salt River Valley Water Association and considered to be more largely responsible for the building of the Roosevelt Dam than any other man, died recently at Long Beach, California. He was president of the Water Users Association for a number of years and was very active in the development of agricultural interests in the Salt River Valley.

Range conditions throughout northern Arizona are showing some slight improvement, due to recent rains and snowfall. A recent rain has also helped range conditions in the lower valleys to some extent. In Santa Cruz County range conditions are reported as being poor and some loss of cattle. Fewer cattle on the ranges throughout some of the dryer districts is favorable.

State Game Garden Prochaska of Arizona is making an effort to keep the White Mountain reservation open for fishing and camping in spite of the recent ruling of the Indian department. The White Mountain section has become one of the best known of the Arizona summer resorts and many will feel a distinct deprivation if they are barred from spending a few weeks in this country.

Some rain and snow has fallen in the northern part of Arizona but not sufficient to be of very much benefit to ranges. However, conditions on the whole are more favorable. The water supply in all parts of the state is inadequate, particularly in the southern half. Some cattle are being moved across the Mexican border where better pasture is available. The ranges in Coconino County are said to be improving.

A preliminary report has been submitted by the U. S. reclamation service on the feasibility of the San Carlos Dam on the Gila River. The estimated cost is something under ten million dollars. Electric power to the extent of 6,500 horse power will be developed. This dam will form a reservoir sufficient for water to irrigate 148,000 acres. It is hoped that congress will see fit to appropriate money for the building of this dam.

Brooding by Thousands

By Jean A. Koethen

NOT every one would undertake to brood 2,000 chicks at once around one brooder stove. There are those, indeed, who say it cannot be done without great loss, but it takes a woman to attempt the impossible, and Mrs. M. L. Sutherland of Buena Park has not only succeeded in it once but is doing it again.

Before she and her husband and her daughter and son in law, Mr. and Mrs. Harry Hughes, moved to their ten acres on Anaheim Road, Mrs. Sutherland, with the help of her family, had kept chickens in a small way—say six or seven hundred hens in a flock—in the city of Los Angeles for 20 years. One learns a good deal if one keeps chickens intelligently for 20 years, and Mrs. Sutherland felt at the end of that time that she was ready to work on a bigger scale. When the family moved to the ranch in 1917 they brought along 480 hens. In a year the profit on eggs laid by these hens was $1050, besides $225 from the sale of culls.

A Profitable Year

On April 8, 1920, 2100 chicks were put in the brooder house. From this lot of chicks an even thousand pullets went into the laying house. When they were five months and ten days old the first eggs were found in the nests. The laying mash was immediately taken away and the pullets kept on a maintenance ration till the end of the sixth month, when they could no longer be kept from laying. From this time on they were fed heavily and the eggs produced in November paid their feed bill and a little more. In December the profit from the eggs of 985 pullets was $400, a labor income of $200 apiece for Mrs. Sutherland and her daughter, who had done practically all the work. In January the pullets went into a six weeks' molt and receipts fell off, the egg yield dropping to 100 eggs a day, but the average production for February was 525 eggs per day, yielding a net income of about $150.

The careful record kept by Mr. Hughes, who is a silent partner in the enterprise, shows that last year, in spite of the high price of feed, it cost exactly $1.17 to bring each pullet through the first six months to laying maturity. This includes the cost of the chicks.

In the Brooder

This year Mrs. Sutherland got her 2100 chicks into the brooder house on the 15th of February and on the first of March when I saw them, they were a wonderfully husky looking bunch,—not a sick or droopy one to be seen except half a dozen which had had their toes picked and were confined to the hospital. The "hospital," by the way, is just a wire cage or basket with its sides covered with white muslin, and stands in the sunniest, most comfortable place in the brooder house. The chicks in it are not worried by being confined in strange quarters. They hear the voices of their brothers and sisters outside and have their accustomed food. They are simply protected from attack.

"Last year," said Mrs. Sutherland, "we had a terrible time with tail picking when the chicks were a month old. I finally hit on the expedient of painting the picked places with a paste made of lamp black and kerosene. The chicks would not pick a blackened place, and in this way we controlled them. To prevent toe picking I keep the brooder house as dark as possible the first week, except at meal time, but sometimes they will pick in spite of everything."

The first week the chicks were in the brooder Mrs. Sutherland slept on a cot in the playroom so that she could watch the stove and keep the heat right all night. At the end of two weeks she was still making a midnight visit to the house to make sure all was well. Perhaps it is because of this watchful care that in two weeks she has lost only 85 chicks, just four per cent of the hatch. "We figure on losing 100 chicks out of the 2,100 the first three weeks," she says. That is less than five per cent, a much smaller proportion than is usually allowed even in far smaller flocks.

The brooder house is a building 20 by 30, divided into two rooms, the brooder room, 20 by 20, and the playroom or cooling room, 10 by 20. The chicks are confined at first to the brooder room and the heat is started at 95 degrees. By the end of two weeks it is down to 80 degrees at night, with practically no fire in the middle of the day. The chicks are kept in the house entirely for three weeks, then are allowed in the outside run which connects with the house by a low door. "Last year we kept them in the house two weeks," said Mrs. Sutherland, "but I am satisfied three is better, and this year they will not set foot on the ground till they are three weeks old."

The large chick yard, which is 50 by 100, is planted to barley, but inside this large yard is a smaller one about 15 by 40, into which the chicks are turned at first. It is a difficult matter to teach 2,000 chicks to go back into the brooder house if they are allowed to spread themselves over a yard the size of a city lot, but the small enclosure with its low wire simplifiies matters, and the chicks soon learn their way home.

Feeding

This year Mrs. Sutherland is following the feeding method outlined by the poultry division. The chicks came from the incubator Wednesday at 3:30 and were not fed till Friday about 10 o'clock. They picked at the sand and alfalfa leaves on the floor and drank fresh water from the big drinking fountains, but got nothing more till Friday morning. Then cracked corn and cracked wheat, equal parts, were sprinkled on the sand, and this was their only grain feed till the sixth day. The second day clabbered milk was put before them in fountains and this is kept before them till they are several weeks old.

Beginning the sixth day a mash consisting of 2 pounds bran, 2 pounds shorts, 1 part corn meal or barley meal, 2 parts beef scrap, 1 part bone meal and .3 pounds powdered charcoal is placed before them for an hour or two in the middle of the day. Gradually it is left longer, till by the end of two weeks they have it before them all the time. Very little green feed is fed the first three weeks, and Mrs. Sutherland is not sure it should be fed at all during this critical time. Lettuce she condemns because the opium it contains makes the chicks dopy if it is fed heavily. Alfalfa is the only green she feeds to either hens or chicks, and a patch of less than an acre has supplied both cow and chickens.

When I remarked that she was brooding but one lot of chicks in a season instead of two or three, as is customary, Mrs. Sutherland replied: "I would have liked to raise two hatches, but I have only one brooder house, and it doesn't do to raise two successive hatches in a house without allowing quite a little time for sweetening the house and yard. Chicks won't do well if they have not a clean house to sleep in and clean ground to run on."

Cleanliness is the keynote of the management of this profitable little ranch. The droppings boards in the laying house are cleaned hastily every other day and thoroughly once a week. Once a month the house is sprayed with kerosene and crude carbolic acid, a quart of acid to five gallons of kerosene. This exacting cleanliness makes it possible to keep 1,000 hens healthy in a house 16 by 80, a thing that would hardly be possible otherwise.

The Vegetable Garden in November

Northern California

By A. R. Gould

THIS is the growing month when we get more warmth to help things along. At the same time, however, we must keep a close watch on the moisture conditions and irrigate where the soil appears dry for several inches. Surface cultivation will also be on this month's program, and lots of it. This stirring of the soil between the rows helps quite a lot and conserves moisture, which is an important point in successful gardening.

Follow up all your work in the garden with a systematic scheme of moisture conservation for the coming months and also apply system to limit the bugs and fungous pests. Aphis you may find on the peas, beans, tomatoes and many other crops. These you may destroy by spraying with Black Leaf 40. Slugs and snails you may find in hiding under the pea vines and other such places, and these you should destroy by hand picking or lime will help some. Fungus diseases may be reduced by burning infected parts and preventive measures such as spraying.

Lettuce

Thin out and transplant extra rows of the variety Los Angeles sown last month and irrigate between the rows.

Corn

Continue to sow both field and table varieties; Golden Bantam, Country Gentleman, Yellow Flint or Golden Dent. Sow three seeds to a group three feet apart. This crop requires a rich soil and before sowing it is advisable to apply a dressing of dried blood or bone meal.

Beans

Sow Kentucky Wonder and Horticultural, two very excellent pole varieties, also the following dwarf: Stringless Green Pod, Refugee and Golden Wax, in rows two feet apart.

Squash, Musk and Watermelons

There is still time to plant these and the varieties advised last month should be planted in mounds four feet apart each way. Hubbard is a good squash, Rocky Ford and Bay View fine muskmelons and Kleckley's a sweet watermelon.

Turnips

Continue to sow Early Snowball in rich soil for a successional supply in rows 18 to 20 inches apart.

Carrots

Those sown last month should be carefully thinned out to six inches apart. Nothing is gained by leaving them close together in the rows. A few good sized carrots are more to be preferred than lots of small ones. Irrigate these every two weeks at least.

Onions

If thinning of this crop was not completed last month this work should be done at once, and more rows may be planted with the seedlings thinned out. See that the soil is well prepared with manure as they require considerable feeding if large bulbs are required.

Potatoes

These should now be making considerable growth and it will be necessary to irrigate very thoroughly this month and keep the cultivator busy between the rows.

Tomatoes

Plants that were planted out last month should be hoed around after being first well watered. There is yet time to plant, the best varieties being San Jose Canner, Earliana and Early Jewel. Place these three feet apart.

Cucumbers

You may still sow seeds of these, three or four seeds to a mound in rich soil, and any sown last month will need thinning out, leaving the healthiest to produce. Best varieties, White Spine and Long Green, and be sure to grow the Lemon variety.

Leeks and Celery

If seeds of these were sown as advised last month the young seedlings will be ready soon for transplanting to boxes and placed three inches apart. Keep well shaded from the sun. Prepare trenches for planting out later by manuring heavily as these are both gross feeders.

Strawberries

These will require irrigating and cultivating between the rows. It will prolong their period of bearing.

Southern California

By D. F. Reichard

THE work in your garden during May means much for the success of your products. The energy expended in cultivating, weeding and pulverizing the soil will mean you will

CASE

TRADE MARKS REG. U.S. PAT. OFF. AND IN FOREIGN COUNTRIES.

THRESHING MACHINES

Consider the Case of Ray Haskill, for instance---

WE could tell you a lot about the mechanical details and technical points of Case steel-built, galvanized Threshers, but this probably wouldn't interest you as much as the *actual performance* of these machines—and anyway, we haven't got the space. What you are especially interested in, no doubt, is the work a Case Thresher will do—and the length of time it will continue to operate satisfactorily. Consider, then, the *Case* of Ray Haskill, of Crump, Michigan. He says, in a recent letter to us:

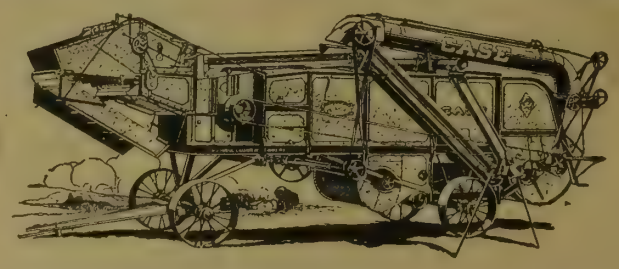
"I won't begin the market for anything this year as my 32 x 54 Case is going strong *after ten years of hard threshing* and I am satisfied with the old girl yet. Just a few repairs and *she is ready to lead the others the same as always.* She runs as steady as ever and in the last six years *has threshed more grain than any two machines in Northern Bay County.*"

Mr. Haskill's Case Thresher working on farm of Mrs. Joseph Herriter, near Linwood, Mich. This outfit has threshed here for 9 years.

Case superior construction and mechanical features are, of course, largely responsible for such service, but we can't begin to tell you about these things here. Our latest catalog has all the facts, however,—and it's nicely illustrated. Write for a copy—and ask for the name and address of our nearest dealer.

J. I. Case Threshing Machine Company

Dept. E4 Racine, Wisconsin



Case Galvanized, Steel-built Threshers are made in the following sizes: 20 x 28, 22 x 36, 26 x 46, 28 x 50, 32 x 54, 36 x 58 and 40 x 62. Will thresh, clean and save all grains and seeds.

Saccharine Sorghums

By Geo. W. Hendry

SACCHARINE sorghums were originally introduced into the United States with a view of utililzng them for sugar production, but it was found that although they compare favorably with sugar cane and sugar beets in sugar content they also possess a gummy material in the sap which interferes with crystallization. They are still grown, however, for syrup production and have come to occupy a very prominent place as a forage and silage crop. They yield the highest tonnage of silage of any of the sorghum group and in forage quality they are superior to either the Durras or the Kafirs. As a group they are late in maturing, and must be planted early in the season in order to insure their ripening before the fall rains set in. They stool more abundantly than the grain sorghums and are slightly more tolerant of cold coast conditions than the grain sorghums, but cannot compete with Indian corn for silage production in the immediate vicinity of the ocean. In seed yield they are far below the grain sorghums and have yielded only from 500 to 800 pounds of seed per acre. The seed of the saccharine sorghums is smaller than that of the grain sorghums and is usually covered with a hard fibrous seed coat making them less valuable for feeding purposes.

Honey Sorghum

Honey Sorghum California No. 23 is a selection from one of the earlier introduced saccharine sorghums, and has been grown extensively in the southern states for syrup making purposes. It produces slender stalks, varying in height from eight to twelve feet. It is medium late maturing and has very tender succulent stalks.

As a producer of forage and ensilage, it has exceeded all other sorghum varieties in tests at the university farm. It has produced an average of 27.43 tons of green forage per acre without irrigation. In these tests the seed was drilled in rows three and one-half feet apart, using three and one-half pounds of seed per acre. The crop was harvested as soon as the seed was hard and before the leaves had started to wither. This is regarded as the most desirable stage to harvest silage. At the university farm in 1917 Honey Sorghum produced a yield of 31.46 tons of silage per acre; at Kearney Park, Fresno County, on sub-irrigated land in 1917 it produced two cuttings totalling 50.68 tons per acre, exceeding all other saccharine sorghums in point of yield.

Under average conditions it requires 153 days to ripen at Davis and 138 days at Fresno. Experiments in California have shown it to be one of the best of its class for syrup production.

Orange Sorghum

Orange Sorghum California No. 25, like Honey sorguhm, is medium late maturing but has rather stout stalks, with longer internodes and broad, though less abundant leaves. The plant varies in height from eight to twelve feet and its stalks are much less tender than those of Honey variety. The heads are heavy and quite compact, somewhat resembling Kafir. The glumes or chaff are red at maturity, while the seeds are reddish yellow and protruding.

In three years' trials at the university farm, it has averaged 18.11 tons of ensilage per acre without irrigation, exceeding the early amber but not equalling the Honey variety.

It is slightly later maturing than Honey sorghum, requiring at Davis 160 days to ripen or about one week longer than Honey sorghum. Under irrigation in 1917 it produced 25.6 tons per acre at the university farm. On sub-irriagted land at Kearney Park in 1917 it produced 27.12 tons of silage per acre, being exceeded by all saccharine varieties except Early Amber in point of yield.

Red Amber

Red Amber California No. 29 is similar to Early Amber except that it makes a larger growth, is later maturing, and has red glumes or chaff in place of black ones. The original seed is said to have been imported into the United States from Australia. In three years' trials at the university farm, without irrigation, it has produced 18.73 tons of ensilage per acre, exceeding in yield the Orange and Early Amber varieties, but not equaling the Honey variety. Under irrigation in 1917 at the university farm it produced 22.6 tons of ensilage per acre, but did not equal Honey sorghum which produced under similar conditions 31.4 tons per acre. At Kearney Park on sub-irrigated land in 1917 it yielded two crops in one season, totaling 45.18 tons per acre. It did not equal the Honey variety in productiveness at this station. It makes the largest second growth, however, of any variety tested, and is a promising crop on sub-irrigated land where two crops may be obtained. It required, under average conditions, 139 days to ripen at the university farm, compared with 124 days for Early Amber, 153 days for Honey, 160 days for Orange and 180 days for Sumac.

Early Amber

Early Amber California No. 31 is one of the oldest and best known saccharine sorghum varieties and was developed from a Chinese importation in the fifties. It is one of the earliest of the sweet sorghums and has become popular in the northern part of the United States because of its early maturity, which enables it to ripen in comparatively short growing seasons. It is characterized by slender stalks and narrow leaves. It produces a succulent fodder, readily eaten by livestock, but the sugar content is not so high as that of the Honey sorghum. In the interior valleys it ripens in 124 days. The average yield of silage per acre at Davis for a period of three years and without irrigation has been 12.41 tons, or less than half the amount yielded by Honey sorghum under similar conditions. It is a prolific seed producer, however, generally outyielding the Honey variety. At Kearney Park in 1917 it produced 19.55 tons of forage per acre on sub-irrigated land, yielding two cuttings, and was the lowest producer of the saccharine sorghums in tests at this place. Two varieties, Dakota and Minnesota Amber, have been developed from it by selection. Because of its early maturity it is regarded as the best of the saccharine sorghum varieties for silage production for plantings made after June 1. The later maturing varieties such as Honey planted at that date would not mature sufficient to be harvested for silage.

Sumac

This is a very tall growing, late maturing variety poorly adapted to California conditions. In tests at the university farm it has yielded 16 tons of green forage per acre, but has been killed by frost 180 days from planting without having matured sufficiently to make a good quality of silage. It has made a much more favorable impression in tests at Kearney Park, Fresno County, where the climatic conditions are more favorable for its development, and it is thought that it may be found to be a useful variety in the warmer southern districts of the state. At Kearney Park it yielded at the astounding rate of 45 tons of green forage per acre in two cuttings on sub-irrigated land.

Shallu

Egyptian Wheat California No. 26—This non-saccharine sorghum is commonly grown in parts of India, East Africa and Madagascar, and is entirely distinct from any other sorghum grown in the United States. Shallu was imported from Indiana under the name of Egyptian wheat by the Louisiana experiment station in about 1890. In 1905 Shallu was grown in Texas under the name of California wheat. Many names have been applied to this variety and used in its exploitation; among them are: California Rice corn, California Golden sorghum, Egyptian wheat, Mexican Desert Wheat corn, and Rice corn. Experience has shown that Shallu is not so dependable as a grain crop as Milo, Egyptian corn, or Feterita. Its principal defects are its tendency to sucker and lodge, and the

non-exsertion of the head from the boot. Its average yield of grain per acre at Davis without irrigation has been for three years 3,542 pounds. However, the grain is inferior to Milo as a stock feed and as a fodder crop it does not compare in quality with the sweet saccharine sorghums. The seed has a high vitality and has been found to germinate more satisfactorily in cold unfavorable soils than many of the other varieties. For this reason it is thought to be especially useful for planting on soils of heavy texture, which remain cold until late in the season.

Sudan Grass

Sudan Grass California No. 1 is the most important forage crop introduced into the United States in the last twenty years. It came directly from Khartoum, Egypt, in 1909 and has been successfully grown and distributed by the university farm at Davis since that date. At the university farm it has yielded from five to eight tons of cured hay per acre in three cuttings without irrigation. It will grow on a wide range of soils from sand to clay, but prefers a warm, dry climate, and does not succeed in the cool, humid coast districts of central and northern California. After seeding it takes from 75 to 80 days to secure the first cutting, about 45 days more for the second and 58 for the third. The hay is palatable to all classes of stock. It is as nutritious as grain or cereal hay, but cannot compete with alfalfa in this respect. A seed crop can be produced in from 95 to 100 days with an average yield of from 600 to 800 pounds per acre. It should be drilled at the rate of from 12 to 15 pounds per acre on a well prepared moist soil from April 15 to June 1. The earlier planting is preferred where irrigation is not available. In the southern part of the state it may be safely planted as early as April 1.

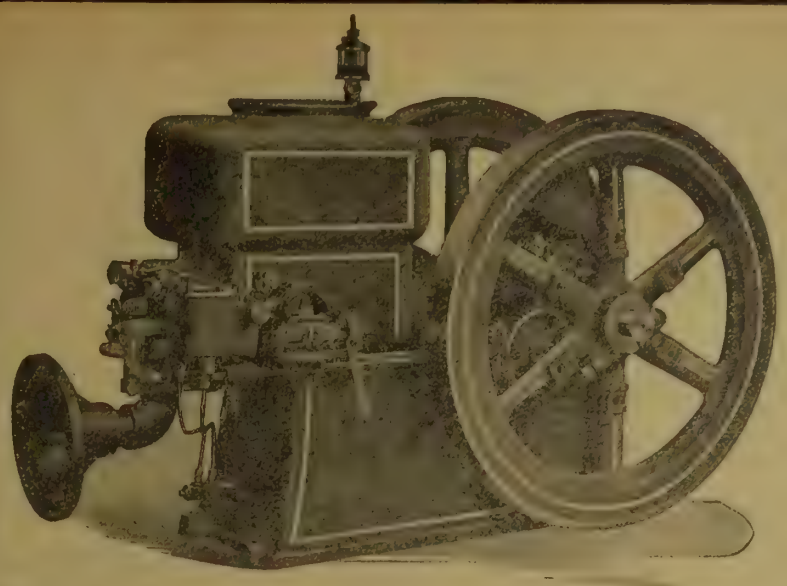
Kaoliang

Brown Kaoliang California No. 36 is the leading variety of the Kaoliang group and was introduced into the United States by the United States department of agriculture in 1898. In its native habitat in China it is found growing in a more northern latitude than any of the other sorghum varieties and is especially adapted to locations having a short growing season. It has been tested by the experiment stations in the northern great plains area of the United States and has been found to possess advantages over other types of sorghums in such regions. As a grain producer in tests at the university farm it has been found to be inferior to the better varieties of grain sorghums and has yielded under average conditions about 2,900 pounds of seed per acre. It is early maturing, however, making it suitable for late plantings; as a forage crop it is of poor quality and resembles the Brown and White Egyptian corn in this respect. Large quantities of Kaoliang seed are imported into California annually from the Orient for chicken feed and it is a standard and well known article of commerce in this state. It is not recommended for cultivation in any part of California, but may possibly find a usefulness in our northern latitudes or at mountain elevations where the growing season is short.

Broom Corn

Broom corn is a variety of sorghum and is thought to have been developed from one of the large open headed types of saccharine sorghums such as Honey by the process of selection. It has been grown in the United States for about 125 years. In the colonial days the industry centered in the New England states, but with the tide of immigration it moved westward into Ohio, thence into Illinois. About twenty years ago dwarf drouth resistant strains were developed by selection and thereupon the center of broom corn industry again moved further westward into the drier regions of Kansas, Oklahoma and Texas. At present about 75 per cent of the entire broom corn production in the United States is made up of the dwarf varieties. The dwarf varieties differ from the standard varieties in that under average conditions they attain a height of from four to five feet, whereas the standard varieties

(Continued on Page 631.)



PRUDENCE

The surest way to add to your resources is to conserve them.

DO YOU REALIZE

that the big Power Companies are straining every nerve to serve you but cannot possibly meet the demands of the coming season and next. Water levels are lowering. Rainfall has been below normal for several years and was less this season than last.

Fifteen Acres A Day

With the American Beauty Dust Sprayer one man can dust 15 acres a day in orchard work. In fields or vineyards the acreage covered is, of course, much greater.

This powerful machine sprays all kinds of dry insecticides with such force that the dust reaches every part of the tree or vine, penetrating the very center of the leaf or blossom cluster, thereby giving thorough protection.

Dusting with nicotine sulphur in an American Beauty Dust Sprayer is unequalled in the control of thrips, aphis, leaf hopper and other insect or fungus pests.

To guarantee best results in dusting use **"Calispray"** dusts made in our own factory for the American Beauty Dust Sprayer—a brand, ready prepared, for every insect pest.

Bringing in the New Help

ELECTRICITY hooked up to G-E motors will do many things to make farm life more pleasant and profitable.

To provide water for all uses—as handy helpers at the silo, wood pile or cider press—to clean up tasks in the dairy, barn, workshop and field—G-E motors are time, labor and money savers.

In the farm home G-E motors take the deadly grind out of wash day—put an end to endless sweeping and in many other ways add to happiness and comfort. If you are near a power line—you need G-E motors.

A Mammoth Horticultural Exhibition

THE California Association of Nurserymen has never made a special effort to have a horticultural exhibit in connection with its annual conventions, though at every one of the ten held there has been a very creditable display of orchard and vineyard products. But at the last big meet, at Fresno, in October, 1920, it was decided to set a record in this respect by holding an exhibition of the earth's products that would surpass anything of the kind ever held on the Pacific Coast.

It was decided to hold the eleventh yearly meeting in Pasadena at the same time that the Pasadena Horticultural Society would hold its autumn flower show, so that the association might cooperate in an endeavor to hold a great plant and fruit exhibition covering the entire horticultural products of the state. The final arrangements were left in the hands of the executive committee of the Nurserymen's Association for action. In going over the matter recently the committee was convinced that Pasadena offered no adequate accommodations in the way of an exhibition hall, and it was doubtful if hotel accommodations would be ample at that time of year.

In view of these facts it was decided to hold the convention in Los Angeles, October 20 to 23 and arrange for a big flower and horticultural exhibition in Exposition Park, state wide in character and embracing the entire range of economic and ornamental horticultural products. This exhibition will include a gorgeous display of flowering and ornamental foliage plants to be featured in the seven acre sunken garden, all of which will be planted during the summer, and present a larger blaze of color and greenery than ever before witnessed in the West. Space in the sunken garden will be free to exhibitors, and plantsmen should arrange for space at an early date. The general exhibition will be given under cover, in the court of the state armory, 240 by 400 feet.

Roy F. Wilcox is chairman of the directorate and H. W. Kruckeberg, 236 Court Street, Los Angeles, is secretary. The other members and their fields are: Fred H. Howard, finance; Los Angeles Chamber of Commerce, publicity; Walter Armacost, cut flowers; Charles F. Gutting, dahlias; Albert Goldenson, florists' displays; W. H. Rapp, Pasadena Horticultural Society's exhibit; Wm. Hertrich, ornamental plants; O. W. Howard, outdoor gardens; R. M. Teague, citrus and tropical fruits; J. S. Armstrong, deciduous, orchard and vineyard products; D. F. Reichard, seeds and appliances; T. H. Wright, premiums; Paul J. Howard, entertainment; John C. Bodger, concessions and admissions; John J. Reeves, housing and decorations; Henry W. Kruckeberg, printing.

The California Association of Nurserymen represents in its personnel fully 75 per cent of the output in nursery products and cut flowers in this state, and when to its resources is added those of the seed industry and the fruit products, it is obvious that the possibilities of the undertaking are vast but its consummation in a large way and on broad educational lines entirely feasible. Not only will the entire state of California be represented, but several Eastern firms have assured the committee that they will send exhibits. This exhibition is expected to be of such magnitude that it will attract visitors from all California and adjacent territory in bordering states, for every commercial horticultural organization of this state is rallying to its support.

Where Avocado is Queen

By Ernest Braunton

"THERE is no better avocado than the Queen," said W. H. Spinks as he pointed to a heavy laden tree of this variety in his orchard near Duarte, Los Angeles County. "The tree is vigorous, of fine form and foliage, and the fruit is ideal in size, flavor, and all that goes to make a high class avocado."

Mr. Spinks has 400 of the Queen, 700 Spinks, 200 Knight, 200 Linda and one or more of every named variety known, and then some. Several years ago he made a practice of planting the seeds from every large fruit purchased for eating. From these he has a motley collection, many inferior to the parent, but a few of equal value, and one, which he has named Alexandria, of great promise. This mixed lot is of a great variety in all principal points. These, with the government collection, make a total of 1,738 trees on the ranch, one-third of them in bearing.

About 20 varieties from government buds, sent in by Wilson Popenoe from Guatemala, are doing well and some are very promising. One in which all avocado sharps are interested is the gigantic Nimlioh, the largest one sent in by Popenoe. He describes it as "One of the largest varieties, and very productive; rough, green, about three pounds in weight." There they are, lots of them, and "three pounds in weight," growing right in the Spinks orchard. Several others of this Guatemalan lot are attractive, but not all equal the description and some do not agree in any characteristic. One, the Pankay, came from 8,500 feet elevation and may prove the hardiest avocado yet grown in California. It is a green pear-shaped fruit weighing about 12 ounces, of good flavor and general appearance.

Mr. Spinks has more avocado trees in the orchard than anyone in California, and more in bearing; also the greatest variety. Added to this is a fine collection of other sub-tropical fruits: cherimoyas, mangoes, sapotes, litchis, longans, Kei apples, carissas, and a score of others. While much money is taken from the crops, much is returned, indirectly, to the soil, for Mr. Spinks believes in heavy feeding and the best of care, not a weed to be seen, and all trees in vigorous health. Though a man of considerable means and broad business experience, Mr. Spinks said to the writer: "I wish to be known above all things as just a good farmer," and the appearance of his ranch justifies the opinion that his wish has been fulfilled.

BETTER LEMON OUTLOOK

For four years scientific experts have been working on a process for the dehydration of citrus juices and have just received patents on their product, known as powdered lemon juice. The product has the consistency of sugar or corn meal and retains all the natural flavor of the fresh fruit without the oils from the peel and can be used for making lemonade, sodas, pies or anything that fresh lemons can be used for.

A factory, now erected in Los Angeles, has a capacity for handling 65 tons of fresh fruit a day and turns out 5,000 pounds of the finished product—all of which is contracted for by the parent company in New York for use in light beverages which they manufacture. Plans are under way for the construction of another large plant in Pomona, where equipment will be installed to care for the crops of many groves, and powdered lemon juice will be made in sufficient quantity to care for commercial demands.

The western division of the Granite Springs Estate, which controls the new process, is under the management of Seth A. Burrows, who during the period of the war was engaged in dehydration work for commercial purposes in a large way, and has invented, manufactured and installed a number of successful plants.

This company announces that, regardless of the present depressed condition of the lemon market, it is ready to make five year contracts with growers for run of the orchard fruit, and

will pay $30 a ton for lemons and $40 for oranges, f. o. b. factory in Los Angeles, including this year's crop. First grade fruit may be retained for market by the grower.

SPECIAL STUDY OF DUST INSECTICIDES BY THE DIVISION OF CHEMISTRY

Responding to the demands of growers for more information on the quality of the various dusting materials on the market, the division of chemistry of the state department of agriculture is now engaged in a special study of the matter. Manufacturers have been warned to exercise more care in labeling and to correct certain misleading statements which have been made in some instances.

Representative samples have been collected and are now being examined under the supervision of Geo. E. Colby, the division's chemist, both in regard to composition and labeling. A report of this investigation covering nicotine-lime, nicotine-sulphur, and nicotine-sulphur-lead arsenate mixtures, with lime or other carriers, and a few tobacco dusts, will be available in the near future.

In this connection the following letter has been sent by Geo. P. Gray, chief of the division, to the more important manufacturers of dusting materials which have come to the attention of the department:

"The attention of the department of agriculture has been called to certain irregularities in the labeling of dusting materials, particularly those containing nicotine as one of the active ingredients. Some lots of material have been observed which contained no labels of any description. Others apparently had been labeled but practically all of the labels had fallen off.

"Some complaints have been made which would lead us to think that on account of material not having been labeled lower grade material had been accidentally delivered for higher grade; that is, in one case material said to be six per cent nicotine was found to contain less nicotine than that sold as three per cent. Unless these practices are corrected immediately the division of chemistry will have to take energetic action.

"If a statement of active ingredients is made the percentage of 'Black Leaf 40' cannot be considered as a definite statement of active ingredients. This percentage should be stated in terms of nicotine."

AGRICULTURE AIDE RESIGNS

R. H. Taylor, assistant to Director Hecke since the formation of the state department of agriculture, resigned effective April 15.

For many years engaged in the study of almond culture at the University of California, he finds an opportunity to extend his work along practical lines now made possible in his new capacity as field agent for the California Almond Growers Exchange, with headquarters at San Francisco.

Mr. Taylor will still be affiliated with the state department of agriculture as collaborator, and his new field of work should emphasize the value of his services in this respect.

WHERE CALIFORNIA DOES NOT LEAD

By Hartley E. Truax

California prides herself, and rightly, on her progressive spirit and the lead she takes along many lines. Her cooperative associations to market farm crops are a model in all sections of the United States. Her standards in packing fruit are so high that there is never any trouble about rejections in the market. But the growers and shippers of potatoes in California have not earned an enviable reputation on the quality of their grade and pack. In fact, California lags far behind most of the other potato states in this respect. Practically all of the other potato producing regions of the United States either voluntarily or under a state law grade and market their crop on the basis of the U. S. grades. These standards have been in use so long that every member of the potato trade understands what is meant by a U. S. No. 1 potato.

Marketing potatoes is not a problem which can be confined within state lines. In Chicago one may find potatoes from Minnesota, Wisconsin, Idaho, Washington, Colorado and California. If all of the other states are grading their potatoes and California is not, the dealers cannot be expected to buy the California product. And that is just the kind of competition that California growers and dealers have to meet at the present time. Right now the graded potatoes from Idaho are selling at a large premium on the Los Angeles market over poorly graded stock from California. If this is true in our home cities, what is to be expected in the markets in other states? Isn't it time for the growers and shippers of potatoes in California to wake up, grade and sell their product on the basis of the U. S. grades and help sustain the reputation the state has gained through the grading and marketing of fruit and nut crops?

There seems to be a widespread interest among the growers of potatoes in Southern California in the question of grading potatoes, and it is believed that many of the producers will make a start along this line during the coming season.

FREEZING FRUIT TO PREVENT SPOILING

Preserving fresh fruit by freezing has passed the experimental stage. The office of preservation of fruits and vegetables, bureau of markets, has been investigating the new method for several years and the investigators report that such fruits as strawberries, raspberries, loganberries, blue berries, currants and cherries are now being frozen and held in commercial lots.

So far as the process is concerned this method of preservation has all the merits of simplicity. The fruit is frozen in the same crates in which it is marketed. The temperature required is about 10 degrees Fahrenheit, though soft fruit is usually subjected to a lower temperature than that of better quality. So long as the temperature is maintained the fruit can be kept in storage. The frozen product must be used as soon as it is thawed, however, as thawing breaks down the tissues and allows the fruit to decay rapidly.

In ice cream, or when made into pies and preserves, the frozen fruit is in every way comparable to the fresh product. In preparing their report the representatives of the United States department of agriculture state that the practice is to be recommended in sections where there is a surplus of production and sufficient cold storage space available to accommodate the fruit. Only fresh, sound fruit should be frozen. Freezing does not do away with mold, though mold will not develop as long as the fruit remains at the temperatures employed.

GRAIN GROWERS CONFERENCE

This conference at the university farm, Davis, May 17-19, is designed primarily for farmers engaged in grain farming. Its purpose is to familiarize them with the more recent results of experimental work on grain production. The week will be devoted to lectures and demonstrations on the value and adaptation of the new and promising varieties, the effect of various cultural processes, and the use of cropping systems and rotation in grain farming. The control of diseases by the development of disease resistant strains and by seed treatment, as well as the handling and grading of grain, will be featured.

In order to acquaint the farmer with the work the division of agronomy is doing, a large part of the time will be utilized in the field in viewing and discussing the work that is being carried on.

The Program

Tuesday, May 17, 9 a. m.—Address of Welcome, Dean Van Norman; Grain Growers Conference, B. A. Madson; Cereal Varieties and Their Adaptation, G. W. Hendry.

1:30—Quality as a Factor in the Value of Wheat, Geo. R. McLeod, Agriculturist, Sperry Flour Co.; Field Trip.

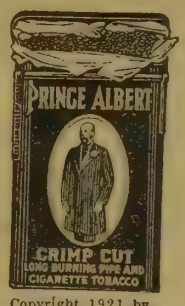
Wednesday, 9 a. m.—Market Grades of Grain and the Application of the Federal Standards, B. A. Madson; How grain is graded and the factors which

A pipe's a pal packed with P. A.!

Seven days out of every week you'll get real smoke joy and real smoke contentment—if you'll get close-up to a jimmy pipe packed with cool, delightful, fragrant Prince Albert!

You can chum it with a pipe—and you will—once you know that Prince Albert is free from bite and parch! (Cut out by our exclusive patented process!) Why—every puff of P. A. makes you want two more! You can't resist such delight!

And, you'll get the smokesurprise of your life when you roll up a cigarette with Prince Albert! Such enticing flavor you never did know! And, P. A. stays put because it's crimp cut—and it's a cinch to roll!



Prince Albert is sold in toppy red bags, tidy red tins, handsome pound and half pound tin humidors and in the pound crystal glass humidor with sponge moistener top.

VEGETABLE GARDEN FOR MAY IN SOUTHERN CALIFORNIA

(Continued from Page 609.)

harvest a crop of well grown, well matured, fully flavored vegetables that are always the hope of every one when starting his garden in early spring. Much of the stuff planted is up and needs cultivation and hoeing—some of it will need irrigation.

In cultivating do not work the ground too deep immediately around the plants as it disturbs the young tender roots and checks them in their hunt for nourishment. In the centers of the row cultivate deeper so as to always keep a good mulch. The hoe will have to be used between the individual plants in the rows to kill weeds and to keep a good mulch around the plants. It is always well to draw the dirt up around the plants as they grow. Hill them up slightly. This keeps the roots well covered and in cool damp soil. No doubt moisture will be needed for some of the stuff. Furrow between the rows and turn the water down these furrows so that it runs slowly, soaking in well as it goes. After a couple of days, when the soil will work up nicely and not stick to the tools, cultivate all the irrigated portions to keep the ground from baking and drying out. In very small gardens where it is not practical to use a wheel cultivator good results are secured by sprinkling. If sprinkling is resorted to be sure to let the water run long enough to thoroughly soak the ground, then as soon as the soil is workable go over it with a hand cultivator or rake to pulverize the surface.

It takes moisture to make good succulent vegetables, and it takes frequent irrigations and cultivating to keep the moisture where the plants can get it. Unless one's soil is naturally moist it will be necessary to supply the needed water from time to time during our dry season. During this month and on through the summer we must keep on the lookout for insects and diseases attacking the plants, shrubs and trees about the place. Especially be diligent about keeping the aphis or little green flies subdued. Thorough spraying with Black Leaf 40, a tobacco extract, is the best control.

Plantings of seeds of many vegetables are in order for May for continuation of supply of fresh garden truck. Make sowings of sweet corn and string beans every three or four weeks. Put in squash, melons and cucumbers to come in after your first plantings have cropped. Roselle may be planted with assurance of a crop if gotten in the first part of the month. Some of the hardier vegetables such as beets, carrots, radish and lettuce should be put in. It will be most too hot to produce turnips and peas if planted now—wait till August.

Southern Arizona

By M. E. Bemis

GARDENERS in southern Arizona during the months of May and June may confine their activities largely to a preparation for the future and retrospect of what might have been in the past. In other words, the gardener who was active in January and February now has a succession of almost all kinds of vegetables coming on and will have for some time.

The plantings which may be made now are rather limited, but nevertheless there are many things which may be done to employ any spare time and which will admirably prepare for future gardening operations. There is still time for planting pumpkins and squash. Peanuts may also be planted. Without much doubt there is a big future for peanut growers. Some big crops have been raised and the nuts bring good prices, prices that will almost always compare favorably with the prices of other farm and garden products. The one big difficulty and the principal obstacle to be overcome is to secure a stand. Germination seems to be poor. The subject of seed germination under irrigated conditions is still more or less in an experimental stage and there is a field here for some research work that will mean many thousands of dollars to gardeners. Peanuts are only one of several plants the seeds of which germinate poorly under irrigation. With this difficulty overcome peanut growing will be an important industry in southwestern irrigated valleys. Even with this handicap quite frequently some good stands are obtained and the resulting crop of peanuts is more than satisfactory. With light soil, well fertilized, it is worth while to plant a few peanuts for home use. The Virginia bunch is the variety best adapted.

Casaba melons are considered by many a delicacy that makes them a favorite on the markets in the fall and early winter season. Planted at this season of the year they will mature at a time just following the watermelons and cantaloupes and just long enough after so that they sell readily at a fair price. For the home garden they help to keep something coming along all the time, and they have the advantage of the watermelons and cantaloupes in that they will keep longer and also that a succession may be planted, insuring a continuous supply from August to Christmas. There are a number of varieties.

The ground, cleared of peas, beets, turnips, etc., need not necessarily grow up to weeds, as there are a number of things which may be planted that will be useful and less unsightly than weeds, besides not spreading seeds that will be a future menace.

Cow peas grow readily and with little trouble. The cow peas, while the pods are still green, may be shelled and make a dish that is relished by some as well as shelled beans. A few rows of cow peas to add variety would be worth while if they had no other value. As a soil renovator cow peas cannot be beaten, especially for quick growth. They will smother out weed growth, add humus and nitrogen to the soil, and the dried peas make good stock feed, or the vines may be cut for hay.

The grain sorghums grow quickly and produce a considerable amount of grain that can be fed to poultry. Otherwise idle ground might much better be producing a crop of milo or hegari than growing weeds.

Sudan grass also grows rapidly and will smother weeds and furnish a considerable amount of hay or pasture. Where there is little green feed available for chickens a patch of Sudan grass will furnish an abundant supply of green feed that is much relished by both old and young chicks.

DECIDUOUS FRUIT MEETINGS IN LOS ANGELES COUNTY

During May the agricultural extension service, in cooperation with the various farm bureau centers in deciduous fruit districts, is to hold a series of seven summer pruning demonstrations. The proper method for summer pruning treatment will be demonstrated and general problems of summer care of deciduous fruit orchards discussed. It was hoped that Dr. J. C. Whitten would be able to be present at these meetings, but recent information is to the effect that it is doubtful whether he can attend. The meetings will be conducted by Farm Adviser Hodgson and Assistant Farm Adviser Blanchard. The schedule for the series is as follows: May 10, 2 p. m., Downey, meet at Gallatin school, later going to nearby orchard. May 11, 10 a. m., Owensmouth, place of J. C. Craig, two miles east of Owensmouth on Sherman Way. 1:30 p. m., Zelzah, place of G. A. Allard, one-quarter mile off Reseda Ave. on Regan St. May 12, 10 a. m., Lankershim, place of F. L. Williamson, 12309 El Nido St., west of Pacoima and east of Whitsett. 2 p. m., Van Nuys, place of W. F. Clarke, Van Owen and Woodman. May 16, 9:30 a. m., La Canada, place of B. J. Kirst, north of east end of Michigan Ave. 2 p. m., Pomona, place of H. W. Hall, Reservoir and Philadelphia.

Walnut meetings: Tuesday, May 10, 10 a. m., El Monte; 2 p. m., West Covina. Wednesday, May 11, 10 a. m., Whittier. Thursday, May 12, 10 a. m., Chino; 2 p. m., Pomona. Friday, May 20, 10 a. m., Los Nietos. A large attendance at these demonstrations is expected.

VIKING PUMPS

Save at the Fountain Head

Sizes:

10, 20, 35, 90, 300,

450 and 1,050 gals. per min.

THE VIKING will save 20% in power costs as compared with the average stock pump of the same size and capacity. Reason: Rotary principle—no unnecessary waste of power. Easy to install; no priming pump or foot valve required.

Catalog Upon Request.

Quick Gopher Eradication

On April 2, 1921, our illustrated "Su cessful Gopher Trapping" article appea ed in the Pacific Rural Press. April Mr. J. Aschwanden of Santa Cruz, Cali who read the article, sent us 75c for o of the **Chubbuck Double Catch Goph Traps,** which trap went forward April the day we received the order. Below one of the four illustrations used in t Press article:

Catches Gopher Any Size or Age

Today, April 12, we are in receipt of following letter from Mr. Aschwanden:

Santa Cruz, 4-9-2

E. J. Chubbuck Co.,
San Francisco, Calif.

Dear Sirs: Received trap and your letter on 7th, and on the 8th I set the trap seven times caught seven gophers all in one day, and some those I could never get before with several diffe kinds of traps, nor with gas. I assure you that I highly pleased with your trap, and you can look more business in the near future from my neigh as I am telling every one of them about it, and them the good results. Thanking you very muc remain. J. ASCHWANDEN.

Reports like the one made by the Sa Cruz customer have been coming in fr all sections. Four days ago we shippe full gross **Double Catch Traps** to one C fornia Ranch. The attention of the perintendent of the ranch had been ca to our trap by an advertisement in California Cultivator.

If you cannot secure these traps f your local Seed stores or Hardware d ers, send direct to us. **Price, postpaid,**

E. J. CHUBBUCK COMPANY

Manufacturers, Dept. A.

731 Market Street, San Francisco,

Coast Fruit Industry Endangered by Present Freight Tariffs

AS A result of the investigation made by a representative committee of the principal food producing and shipping interests of the state, the very startling statement is made that owing to the increased freight rates brought about by the enforcement of the federal transportation act of 1920 the grower finds each acre of land he controls saddled with a tax which to all intents and purposes is as binding as if he voluntarily had placed a mortgage on his acreage, provided he ships his product out of California.

This committee which was named by State Market Director Daniels, following a state wide conference of producers' associations and shippers called at the suggestion of Governor William D. Stephens, is composed of: G. Harold Powell, California Fruit Growers Exchange; J. F. Niswander, California Peach and Fig Growers Association; C. C. Teague, California Walnut Growers Association; J. M. Henderson, Jr., Associated Dairymen of California, Inc.; Roger Edwards, California Lima Bean Growers Association; Herbert Hazeltine, American Fruit Growers, Inc.; F. B. McKevitt, California Fruit Distributors; J. H. Barber, Poultry Producers of Central California, Inc.; J. L. Nagle, California Fruit Exchange.

Governor Stephens in his communication to the state market director stated that he was of the opinion that the time had been reached when very diligent inquiry should be made into the rates allowed the transcontinental railroads by the interstate commerce commission and suggested that a course of action be developed which would assure that the industrial life of the state be effectively safeguarded. He also stated that the burden imposed upon the people of the state was so great that he felt it the duty of the state government to look into the matter and ascertain if California was being fairly and justly subjected to this great tax on everything that is shipped by railroad in or out of the state. A quotation from a recent communication of the governor to this committee of growers reads: "We must be ready to assume our just burden. We cannot and will not ask for special favor. We must insist, however, that there shall be sympathetic understanding at Washington of our agricultural and industrial situation and of the handicaps we suffer because this state is at a maximum distance from the great markets."

This committee in submitting its report to Governor Stephens states that the burden caused by the increase in freight rates, which mean mortgages on practically every acre of the land of many growers, in some instances takes from the industries more than the average return of profit, and as proof thereof, cites the added tax per acre on 12 different food products, which are the principal edible commodities produced in California:

	Added tax per acre	As if capitalized at 7%
Lemons	$187.67	$2,681.00
Oranges	192.38	2,748.28
Rice	19.49	278.43
Beans	10.65	152.14
Raisins	17.87	255.29
Grapes, shipping	162.51	2,321.57
Olives	28.60	408.57
Walnuts and almonds	15.08	215.43
Prunes, dried	35.75	510.71
Apricots, dried	17.88	255.43
Peaches, dried	21.44	306.29
Apples, fresh	160.87	2,298.14

This question, which so seriously affects the production and distribution of food in California, has also received a great deal of attention in the other western and coast states, and any action taken here as a means of relief will, in the opinion of the committee and State Market Director Daniels, be followed by the growers and shippers in other sections of the West.

The committee is of the opinion that while the present federal transportation act stands there is no opportunity for a real reduction in rates, and that an appeal must be made to congress for the repeal of the objectionable features of this act, as it affects the production and distribution of food products of California.

It was deemed advisable by this committee to petition congress for a repeal of that portion of the transportation act which guarantees an aggregate annual net railway operating income of six per cent upon the aggregate value of railway property held for their use in the service of transportation, regardless of whether or not the individual road has ever earned, or will ever be able to earn a profit, and without consideration of the amount of tonnage which it might reasonably expect to transport.

The repeal of this section of the transportation act will place the matter squarely before the interstate commerce commission.

CROP REPORTS

George Marchbank, Horticultural Commissioner, Madera County

Deciduous fruits have been practically free from frost damage. Estimated crop:

Plums, 100 per cent.
Peaches, 95 per cent.
Prunes, 50 per cent.
Almonds, 50 per cent
Apricots, 35 per cent.

Estimated damage to grapes as follows: Wine grapes, 60 per cent; raisin grapes, 35 per cent.

The two chief factors lessening the frost damage have been water and windbreaks. Of these two, water has been the greater. It has been generally thought in the past that weeds protected the vineyards, but this year in this community it has proved to be the opposite.

I have not had any report from the mountain district about the apples, and the pears and cherries are not grown in this county excepting a few trees in family orchards.

D. D. Sharp, Horticultural Commissioner, Riverside County

The delay in answering your letter was occasioned by the difficulty in estimating the extent of the frost damage at first; we may be low at the present time but we feel in giving the estimates below we can raise later if necessary which is better than having to come down.

Almonds: 106 per cent.
Apples: 90 per cent.
Apricots: 50 per cent.
Cherries: 65 per cent.
Peaches: 40 per cent.
Pears: 85 per cent.
Prunes: 80 per cent.
Grapes: 75 per cent.

Oregon Growers Cooperative Association

Reporting conditions in Eastern fruit growing sections—

Apples: Arkansas and Missouri, almost total loss, with all fruits damaged. New Jersey, severe damage. New York and New England states, fully 50 per cent loss. Michigan, heavy loss.

Pears: Missouri, heavy damage. New Jersey, 80 per cent loss. Michigan, 25 per cent loss. General damage to commercial crop.

Cherries: New Jersey, 95 per cent loss. Michigan, 25 per cent loss. New York, 75 per cent loss. New England states, 75 per cent loss. General loss of commercial crop throughout middle western states.

Peaches: Missouri, crop gone. New Jersey, New York and Atlantic seaboard, heavy loss to commercial crop. Michigan, loss 85 per cent. General loss in Middle West.

A. Hancock, Bakersfield, Kern County

Almonds: 80 per cent.
Apples: 90 per cent.
Apricots: 95 per cent.
Peaches: 90 per cent.
Pears: Kern Valley, 90 per cent.
Prunes: 90 per cent.
Grapes: 100 per cent.

I have waited till the weather settled so as to give a more definite idea of the prospective fruit crops in Kern county. The prospects are now good in all except the Tehachapi country where reports say pears are gone and apples hurt, but have nothing more definite. In the valley district here we had no frosts to hurt, and the prospects are now excellent.

Ohio College of Agriculture

From observations reported to the Ohio College of Agriculture it appears that the recent injury from frosts on apple trees were more particularly marked on certain varieties than on others. The fruit on trees that were in blossom or past blossoming was entirely destroyed. The trees that were not so badly injured were the Rome Beauty, York Imperial, Grimes Golden, and to some extent the Yellow Transparent, Stayman Winesap and the Spy. The varieties that showed marked injury were the Baldwin, Ben Davis, Delicious, Greening and practically all of the summer and early fall apples.

PORTO RICO MANGOES

In the last annual report of the chief horticulturist of Porto Rico, the varieties of imported mangoes fruiting during the year are briefly discussed. The seedling trees of Cambodiana which have fruit show that, while no assurance can be had of securing fruit true to type, the chances are good for securing either such fruit, or, if different, fruit with a pleasing flavor.

The Byron Jackson Deepwell Turbine

In big business

Great public service corporations are possible only because their operations are scientifically carried on.

Economy—that is the economy of a long period of time—is the basis of every move.

Which accounts for the general preference given to Byron Jackson pumps by such corporations.

Whether the pump is to deliver 50 or 200,000 gallons per minute, true economy and dependability are the governing factors in Byron Jackson construction.

Use a Trailer—

Statistics show that the farmer uses his automobile for transporting goods more than for "pleasure." Making your auto a business aid is wise. But the same utility can be gained and all possible damage to your car avoided by the use of a light, durable, easy-pulling, properly-balanced, 2-wheel Reliance Trailer.

Your hauling capacity is greatly increased with no additional investment in motive power. Your car is saved from wear and tear. The small-haulage problem is solved.

Reliance Trailers are built by experts who thoroughly understand trailer requirements. Easily fitted with any type body and quickly detachable. Guaranteed. Write for catalogs and name of our nearest dealer.

Interest on Deferred Payments

I made a contract for the purchase of land upon installment payments. The contract provided for six per cent upon deferred payments and contained the clause that if I should be unable to make any of the payments strictly on time that I could have from one to six months extension of time. Can the vendor charge me ten per cent interest on this extension?—Subscriber, Hanford.

Apparently the only provision is for six per cent upon deferred payments. That would be the measure of the interest in any event. There is no possible ground for requiring ten per cent as even if no interest is prescribed the legal rate is seven per cent.

Wages Docked

A ranch laborer hired by the month, who lays off a day, is docked at the rate of 26 days. Is this legal? If not, what can be done?—Subscriber, Perris.

It would seem that the proper measure would be to divide the monthly wage by the number of working days and then multiply this by the number of days laid off. That would be the extreme to which an employer should go. The usual method would be to divide the wage by the number of days in the month and multiply this by the number of days laid off.

Homestead—Mineral Claim

I have filed on a section of land under the homestead act. If an oil company starts to drill on the property and gets oil am I entitled to any of the output?—Subscriber, Exeter.

The claim under the homestead act is for agricultural land and that of the oil company would be on the ground that the land is mineral. If oil is discovered the company could probably contest the homestead claim and claim that it is mineral land. If this was decided in favor of the oil company the homestead claim would probably be refused to patent.

Bought Liberty Bond

I agreed to purchase a Liberty Bond through a bank and made all payments. Before delivery of the bond the bank failed. I have been unable to obtain either the bond or any satisfaction. Am I obliged to take the percentage that depositors take or am I entitled to my bond?—Subscriber, Newman.

Unquestionably this was a trust transaction. The bank simply acted as agent of the government and took your moneys in trust for payment to the government for this bond. Such being the case, you would be entitled to receive the bond which you purchased without deduction.

Pasture Bill Not Paid

Horses were placed in my pasture and left there for some three months. The owner's agent, who came to get the horses, not having money to pay the pasture bill, arranged with the owner to leave two saddles as security. The owner now claims that I should turn over the saddles as the horses were only rented. What should I do?—Subscriber, Castaic.

You had a lien on the horses for the value of their pasturage, but this lien is dependent upon possession. As you gave the lien up on the horses and took in lieu thereof the saddles, your lien rests on the saddles. If they did not pay the pasture bill, your action would be to foreclose the lien.

Age of Majority

Real estate in Kansas has been given to a girl who is now 18. Can she legally deed this property? If not, what is required of her legal guardian in the selling thereof?—Subscriber, Hemet.

Under the law of California a girl obtains her majority at the age of 18. In many of the Eastern states she does not become of age until 21. If, in the particular state in which this land is located, she does not attain her majority until 21, it would be necessary for the guardian to present a petition to the court wherein she was appointed guardian and procure an order permitting the guardian to sell property. Then, as such guardian, she can make the deed and forward it with the order of court.

Exempt from Execution

A head of a family places a homestead on his ranch and claims exemption on his farm implements and stock in accordance with the law of Californit, exempting property from execution. Can this homestead and exempt property be claimed by his creditors?—Subscriber, Yuma.

A homstead up to the value of $5000, together with such property as is exempt from execution by law, is in a bankruptcy court set aside to the bankrupt and none of it is applied to the payment of creditors.

Resurveyed Line

A buys land, improves it with a pumping plant, reservoir and ditch along the east side. He then sells the land to B, who sells to C, stating that the property line is five feet east of the reservoir and ditch. C makes further improvements. Thereafter, D, who all of the time has owned adjoining property on the east side has a new survey made and claims that the line is to the west of the ditch and reservoir. D thereupon demands the removal of C's improvements. Can C demand that A or B pay him for the loss or damage?—Subscriber, Earlimart.

It is quite probable that D having stood by all this time and seen these improvements made would be estopped by law from making claim to the property which he now claims by reason of this survey, which he claims to be correct. Merely because one surveyor makes a survey is no reason that the land should be turned over to the adjoining owner. The last survey may be as incorrect as the other. Then again, when the original line was located, there was undoubtedly some reason for locating it there. If it was so located by mutual consent or agreement, D could not go contrary to that agreement, so that the best thing for C to do would be to notify the former owners of the claim of D and in the meantime refuse to permit D to enter the land he claims and require him to bring suitable action by way of ejectment proceedings wherein the matter may be tried out and the evidence of B and A taken as to the original situation.

Wife's Property

A woman marries a widower with three children. Each has real estate which they later sell and invest in a ranch, which is taken in the name of the husband. There is a joint checking account. If the husband dies intestate what share of the property could the wife claim?—Subscriber, Burbank.

The best method to arrange this would be for a joint homestead to be declared and recorded upon the property. In that event the property would go to the survivor in case of the death

of either. These cases where the parties mingle their separate property and the joint earnings of each constitute some of the knottiest problems in the settlement of an estate. It really would be rather difficult to state just what proportion of the property any one of the parties concerned would have upon the death of the other. It is not necessarily the case where property stands in the name of the husband that it is his separate property. In a case such as this where he had separate property it might be that the claim would be made that the majority of it was his separate property. It certainly would be highly desirable for the wife to obtain some written statement by him of the exact standing of the parties, that is to say, to have some accounting made of her interest in the property even though such document may not be recorded but may be between them signed and witnessed. Unless there is such clear evidence of the interest of the parties there would very probably be litigation after death.

Land Bought on Contract

I purchased 40 acres of land on contract, under which I agreed to care for the orchard of the purchaser, one-half of my labor to apply on my land contract and one half payment in cash. I now understand that the entire tract is encumbered with a mortgage although my contract calls for a clear title. If the owner cannot convey to me by clear title, how am I to receive pay for my work? The land is laid off in subdivision map and sold as such, but I understand this map has never been recorded.—Subscriber, Arbuckle.

A party may in this state sell land which he does not even own on the theory that before the time for conveyance of title he will purchase or acquire title thereto, and convey such title. The only recourse of the buyer is an action against the seller for the money which he has paid together with interest. The case mentioned in question, however, is not as bad as that. The mere fact that a person has the whole of the tract mortgaged by no means is any indication of bad faith, as frequently mortgages for large tracts contain provisions that partial releases thereof may be made upon the payment of certain amounts. If the land was sold under a subdivision map which has not been recorded the parties so selling the property may be held guilty of a misdemeanor under an act for recording of maps of subdivision, of date March 15, 1907.

Wife and Son Share Equally

A man who has one son by former wife desires his second wife, who has no children, to share equally in his estate with his son. The property was inherited recently. Does the second wife receive one-half or one-third?—Subscriber, Petaluma.

The property is undoubtedly the separate property of the husband and if he dies leaving the wife and one child, such property would go in equal shares to the wife and child, or issue of such child, the half-blood inheriting equally with the whole blood. By making a will, the expense of probate would be materially reduced, however.

Estate in Three States

A husband, who owns property in three different states, dies without making a will. He leaves a wife and one son. Would his wife and son share equally in distribution of the property or will other relatives get any part of the property?—Subscriber.

As to any property located in California, the wife and son would inherit equally and no part thereof go to the relatives. As the laws of succession vary considerably in different states, no statement could be made as to what would hold in the case of other states.

Legal Will

Is a will wholly written in the handwriting of the testator and dated, legal without the signature of any other party?—Subscriber, Puente.

In this state such a will is legal and will convey both real and personal property. There are states that require witnesses and require that the will be executed with the formalities of publication and declaration which are essential to a will which is not in the handwriting of the testator.

Minor's Marriage

A girl 15 years of age, but giving her age as 18, secured a license and was married. She left her husband ten months before she reached the age of 18. Could the marriage be annulled?—Subscriber, Chowchilla.

The age of consent to marriage in this state for a girl is 15 years or over. There is a provision requiring the county clerk to procure a consent in writing of the parents or guardian of a girl under the age of 18, but it has been held in a number of cases that this latter provision is merely directory and that if by any reason the license is issued and the marriage solemnized, it is in all cases of minors of the age of consent or over an absolutely valid marriage which is not subject to annulment either at the instance of the minor or parents or guardian of the minor.

TENANT GROWERS' DIFFICULTIES

The newly organized growers co. operative marketing associations in the Imperial and Coachella Valleys are experiencing the usual difficulties encountered by such organizations in districts where the farmers have become accustomed to the practice of being financed by the shippers. Local banks are always loath to extend accommodation to renters and the proportion of farmers who own and farm their own lands is rather small. There are many problems encountered by co-operative associations made up of members growing an annual crop, who have in the past relied upon advances made by the shippers to defray the cost of planting and cultivating their crops. It is not so smooth sailing as where the members own orchard properties and are more independent financially.—H. H. W.

TAMARIX AND ELEAGNUS

In 1910 the United States bureau of plant industry imported cuttings of a plant known as Eleagnus, said to be wonderfully drouth resistant and well suited to desert regions and sections of extreme heat. The Cultivator recently wrote to Washington to ascertain if this tree had been introduced to the Imperial and Coachella Valleys. Peter Bisset, plant introducer in charge of foreign plant introduction, answers as follows:

"The Eleagnus angustifolia is a very hardy plant and therefore we confined our distributions of this plant to the colder northern regions, where it is used as a windbreak and for hedge purposes. There are no plants that I know of anywhere in the Coachella Valley, nor do we at the present time have any young plants available. It roots very readily from cuttings, however, and we can have a number of cuttings sent you if you would care to have them. The Tamarix aphylla (also known as T. articulata.—Ed), which is doing so well in the Coachella Valley, especially around Indio, deserves all that you have said about it. It is a magnificent plant and being evergreen is well worthy of further propagation and dissemination."

A&M reliable SEEDS

A & M Selected Strain Dwarf Milo Maize

is the produce of the same fields located in the same section where our seed has been grown for a number of years.

Each season previous to harvest our own representative inspects the fields and every precaution is exercised in order that there may be no off-type seed in the stock which we select for seed purposes.

We are Proud

of the reputation we have gained on Dwarf Milo Maize seed and it is very gratifying to have the many unsolicited favorable expressions from our customers each season in which they state that the seed was all we claimed for it and more.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Winter Potatoes

Please tell me what is the best potato to plant for winter use.—Subscriber, San Luis Obispo.

Fall planting is merely a question of time necessary to mature; the shorter season potato is the best, therefore White Rose is recommended for its average time from planting to harvest is about 60 days.

Ropy Milk

I have a cow that seems all right but when her milk gets sour it gets ropy and slick. Would you use it?—Subscriber.

See that all utensils, strainer, cloths or any appliances that come in contact with the milk are thoroughly washed in strong warm suds, after which the cloths and, if possible, the utensils, should be thoroughly boiled. The trouble often comes from scalding milk utensils with only lukewarm water. If it is actually boiling the ordinary rinsing may answer, but the safest way is to submerge the utensils and continue the boiling for a few minutes. Likewise, if water has been used for cooling, empty the tank from which it is drawn and thoroughly scald it with boiling water. If this does not prevent the trouble set the milk as soon as strained on stove and raise to a temperature of 150 degrees. Keep standing for 20 minutes at this temperature, after which cool as quickly as possible. Stringy milk is usually not caused by condition of cow or feed but by the bacteria which enter the milk after it is drawn. We think the milk if handled in this way will be entirely satisfactory for table use.

Barley for Cow

Is rolled barley good feed for a cow? Will it hurt her any? Is burr clover good cow feed? Will it make the milk taste? I have a cow that doesn't like ground feed but likes rolled barley. She will eat it some, but not very much.—Subscriber, Puente.

Yes, barley is a good feed for cow providing alfalfa or other feed rich in protein is fed with it. If, on the other hand, silage, beets, corn stover or milo stalks are fed one should have more protein supplied and instead of rolled barley, bran or oil cake should be used. Alfalfa is especially rich in protein and barley added to it would aid in balancing the ration.

Measuring Hay in Stack

Will you please give method of computing the tonnage of a stack of hay?—Subscriber, Nevada.

We reprint answer to a similar question given in a former Cultivator:

From the "over" subtract the width and divide the remainder by two, which will give the height that the stack would be were it flattened down so as to be shaped like a brick. This is always true, no matter how tall the stack nor how wide. Having ascertained the height, width and length of the stack, it only remains to multiply together the three dimensions and divide by the number of cubic feet in a ton. For example: Suppose you have a stack 20 feet wide, 60 feet over and 50 feet long. 60—20 equals 40 divided by 2 equals 20. You have now a stack shaped like a brick. Multiplying its dimensions, we have 20x20x50 equals 20,000 cubic feet; 20,000 divided by 512 equals 39.14 tons.—Henry Nelson.

Federal Farm Loan

Can you give me any information in regard to the federal farm loan; whether loans are made in this county and the time it takes to get loan. Also how do they get to appraised value of property? — Subscriber, Los Angeles County.

The federal land bank has been doing business during the past year but in a most restricted way because of lack of funds due to the tie-up of the mortgage companies suit. As announced some weeks ago in the Cultivator the supreme court has held "that these banks were legally created as part of the banking system of the United States, and that the bonds issued by the banks are instrumentalities of the United States government and are exempt from federal, state, municipal and local taxation." Since that time the efforts of the bank officials have been toward issuing and disposing of $40,000,000 in bonds. These bonds bear five per cent interest and are absolutely tax exempt. Applications are now being received for loans under the amortization plan. These applications are being forwarded to Berkeley, though it is announced that the first loans to be issued will be those for which applications were made before the tie-up. Yes, there is an association in Los Angeles County, and in any case the federal farm loan enters every county of the United States. The appraisal is by your own local association first and then by expert sent from the bank at Berkeley. The appraisal may be anywhere from nothing to $750, or possibly $800 for highest quality of land with thoroughly established water right. This high valuation, however, is only in case of valuable producing orchard property; $300 or $400 is usually about the limit for strictly agricultural land.

Fruit Trees Near Line

We bought our ranch a year ago and afterwards found that our neighbor has trees planted two feet from line. We cannot irrigate at same time, so had trouble working up our ground, all last summer, as we couldn't turn on account of his irrigation water. He has owned his place four years and always irrigated his last row of trees and also turned on our line, though the previous owner of our place had asked him repeatedly to stay off. The trees are eight year old orange trees and most of the branches hang over from two to three feet on our line. Would we be allowed to pick the fruit hanging over on our place? Could we put up a fence on the line to keep him off? Could we keep him from running water on our place?—Subscriber, Tustin.

You are entitled to the fruit which grows over your line and you may gather and market or you may trench and cut roots or you may remove as much of the top of the tree as projects over the line providing it interferes in any way with your own operations. Of course it goes without saying that you may construct fence up to the boundary line. On the other hand, if the trees were directly on the line then you could not cut or injure without the consent of the neighbor as he would be a half owner. Neither could he interfere with the trees without your consent.

Twelve Spotted Pest

Can you give some spray, of either liquid or dust, that will control the 12 spotted squash bug in an orchard? Have hand picked until the last few days when they appeared in such large numbers that it is impossible to continue fighting them in this way. They have attacked the peaches, plums, prunes, nectarine, figs, pears, apples and the foliage on almonds. So far the quinces and apricots are not bothered. They are not only eating the foliage but the small green fruit is being destroyed. There will not be any fruit in our orchard if some method of control is not found. A neighbor says that they are as thick as a swarm of bees on his orange trees.—Subscriber, Oceanside.

The only spray which is of value with this pest is one containing Paris green or other arsenical poison. Perhaps the cheapest and most effective way would be to use neutral lead arsenate, six or eight pounds of the paste or moist form to each 100 gallons of water. If dry or powdered neutral lead arsenate is used it should be taken in only about half the weight as it is practically twice as strong.

This Month in the Ornamental Garden

Southern California

By Ernest Braunton

MAY is a month of care in the garden, rather than of planting, for if you have no established garden by now you are not a gardener in any sense of the word. It may be hot throughout May or it may be cool, but it always is a growing month and at no season is the demand for soil moisture greater or more constant. All vegetable life is "full of juice" and the supply must be sustained.

If possible water or irrigate in the evening during hot weather for the plants have then all night in which to drink and recuperate. If watering cannot be done at night it should be as early in the morning as possible. If very hot, water at night and give a very light but forceful spraying before sunrise. This proves a good "constitutional" to invigorate the plant for the desiccative pull on plant vitality the livelong day. For it often happens that at the precise period when plants are growing fastest and need most water hot weather is also in fierce competition for that water.

It should hardly be necessary to say that this is also the season when plants need the greatest amount of food. Therefore give them food in available form if convenient. A little nitrate of soda is a good start for it is immediately available. This should be supplemented, in special cases where plants are to be hurried, by liquid manure. This soluble form of food is quickly available, quickly absorbed by feeding roots and can be more equably distributed than dry manures. Fill a sack with rich stable manure, put it in a tub, barrel or other receptacle filled with water, and after a few hours the water in the vessel will become well colored and ready to apply to the soil. As the solution becomes weaker from use of much water, punch the sack with the end of a blunt stick. This will cause an exchange of water within the sack with that without. Use water, through constant refilling, until it no longer is well colored. Then empty contents of sack in garden and refill with fresh manure. This plan will allow you to feed heavily tender plants that would be injured through contact with manure fresh from the stable.

There still is time for the sowing of many seeds, and plants of still more kinds may be put out. Sow candytuft, centaurea, coreopsis, cosmos, daisies, forget-me-not, gaillardia, marigold, nasturtium, petunia, phlox, pinks, poppies, salpiglossis and scabiosa. Chinese and other primroses for shaded places will do well if seeds are sown in boxes and young plants afterward put where they are to grow. Bulbs of many sorts, if they are fairly well preserved, will give excellent results. They should be planted deeper and supplied with more water than would be advisable in early spring. Some of this class are: amaryllis, allium, canna, cyclamen, dahlia, Gladiolus, iris (Spanish and English), scilla, tigridia, tuberose and tuberous begonia. Plant the last named in the shade in rich, well drained soil, and the result will be the most delicate of flowers during the hottest weather.

Northern California

By A. R. Gould

THIS is the month when the roses bloom and many other flowers are in their full glory. Flowering shrubs have been making a wonderful show. If you failed to apply the commercial fertilizer to the lawns last month do it now if you wish to have them looking green for the summer, and the sprinkler should be applied immediately after the grass has been cut. Continue to plant lippia or wild strawberry. As a ground cover or for banks they are the most satisfactory.

Planting Schemes

Some people like blue effects in their garden, other pink, and others like a color combination. There are all kinds of tastes and we are also glad to say that there are all shades and types of flowers. To attempt to lay out a plan to please everybody would be impossible.

Dahlias

Secure the best varieties and plant out three feet apart. See that the eyes are well sprouted. Plant in deeply manured soil and water moderately at first.

Roses

Keep them well mulched with manure to secure fine blooms and remove side buds leaving the terminal. Spray with Black Leaf 40 for aphis and dust with dry sulphur for mildew, which is usually very troublesome.

Carnations

Tie up these plants and disbud to secure good blooms. Feed with liquid manure.

Chrysanthemums

Secure plants of all types of these, especially single and pompoms, and plant out this month in groups for the perennial border or in rows for cut flowers in the fall. Prepare the soil carefully for best results.

Begonias

No garden should be without a few of these as they are the most satisfactory for shady places, and associated with ferns they look charming. There are both fibrous and tuberous, the latter having a wide range of color and types, being frilled, crested single and double in orange, scarlet, pink, yellow, white and dark red. The fibrous are usually in pink and red, and some of the species are rather tall growing. They delight in leaf soil and peat. Plant these now and fill up that bare spot under the trees.

Southern Arizona

By M. E. Bemis

It is not too late to plant seeds of many of the wonderfully quick growing vines that produce shade so badly needed. The Balsam apple and morning glory are among those that may be planted in early May and will make shade for porches and windows or hide unsightly fences or buildings.

The old fashioned zinnias grow readily from successive plantings and make odd corners, borders of walks or any otherwise vacant nooks attractive.

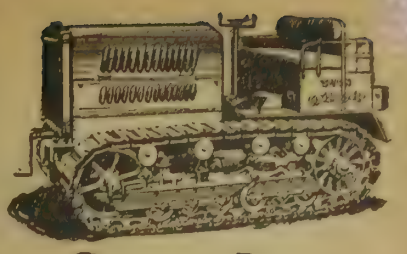
Cosmos may also be planted this month, and this is another flower that might well be cultivated more and adds to the attractiveness of home surroundings.

CITRUS INSTITUTE IN JUNE

The summer meeting of the Citrus Institute will be held at Whittier. The date for the meeting has not been set as yet but will be some time in the latter part of June. Citrus growers would do well to bear this in mind.

FARM BUREAU CONFERENCE

The annual farm bureau conference excursion will be held the last week in May, 23-28 inclusive, leaving Berkeley at 8 o'clock Monday morning, the 23rd, and ending at Bakersfield Saturday evening, the 28th.



Compact Power

All the standards of Holt design and construction are reproduced in this "Caterpillar" 5-Ton Tractor. It is small in size but big in reputation and performance. "Caterpillar" 5-Ton Tractor is narrow, low-down, lightweight, versatile, dependable, long lived and has three speeds. It completely fills the need for small power jobs just as the "Caterpillar" 45 and 75 do for bigger jobs. Get complete information from the nearest Holt Branch or agency.

Enjoy Sun Heated Water

Day and Night the sun will give you plenty of hot water—

For bathroom, kitchen or laundry.

No waiting for water to heat—just turn the faucet, and quick as a wink, the fresh sun heated water is steaming in the tub.

The DAY & NIGHT SOLAR HEATER concentrates and stores the heat of the sun's rays.

Over four thousand successful installations provide actual proof of DAY & NIGHT'S success.

Installed in new or old homes.

Write now for illustrated folder giving detailed description. A post card will bring it.

Address: Dept. E.

Los Angeles, Cal.

What He Means to You

THE Watkins Man who calls at your home makes buying easy—convenient. He saves you time and trouble. He saves you money, too. Watkins products, as you know, are sold *direct to the user* through authorized Watkins Retailers. It costs less to sell that way—and you gain as a result.

Important as these things are, however, there is one thing *even more important* about the Watkins Man. It is the products he sells. Watkins products have been household stand-bys for more than fifty years. Their quality, in all that time, has never varied It has always been the highest.

Twenty million satisfied users swear by Watkins products today. More than 4,000 Watkins Men are kept busy supplying the demand.

It pays to hold your orders till your Watkins Man makes his regular calls. If one has not called recently, write to us—we'll gladly see that you are supplied.

137 Quality Products

are brought to your home by the Watkins store at your door. Among the 137 Watkins products are: Livestock and Poultry Preparations; Household Medicines, Liniments, Balsams; Spices Extracts, Coffee, Baking Powder, Washing Compound, Tube Flavors, Soaps, Shaving Cream, Perfumes Toilet Waters, Face Creams, Powders, Tooth Paste, Tooth Brushes; Automobile Supplies, Tires, Tubes, Spark Plugs, etc.

Fresno, Bakersfield, Taft

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

Household Department

A HILL SONG

Oh, towns were made for listless folk,
who tread an ordered round,
Who fence their petty lives about with
mark and mete and bound.
But hills were made for virile folk, who
dare to walk alone,
With all the world beneath their feet,
and all the sky their own.

Oh, streets were made for feeble feet that
keep a mincing pace,
That beat a treadmill path across the
city's hampered space.
But trails were made for sturdy feet, that
love to do and dare,
And ask no pleasure but a road that leads
them anywhere.

Oh, roofs were made for timid heads,
that guard their eyes from fright,
With lofty beams and rafters strong
above them day and night.
But hills enfold a sounder sleep, warm
in a blanket bed,
With aspens laughing in the wind, and
star-fire overhead.

And city folk may have their town, and
walk their ordered way;
And live their close and sheltered lives,
day by eventless day.
But we who are the hill folk will ask
God this grace—
A winding trail beneath our feet, the
hill wind in our face.

—Ted Olson in Sunset.

WITH PUP'S ASSISTANCE

"MARTHA, do you think it would be possible for us to buy the Peters grove?"

"No, Phil, no; I do not. What made you think of such a thing?"

"Well, they are wanting to sell, and he has offered it to me at a bargain."

"Oh, dear. It's dreadful to be hard up," from Martha. "It seems a good chance to make some money, but I don't see how we could possibly handle it. We can think it over, but it looks impossible. But, my goodness!" looking at the clock, "where's Billy? We'll surely be late for the parade. Billy!" she called, "nearly ready?"

"Yes, Aunt Martha," from somewhere out of doors, accompanied by vigorous whistling. Then "Aunt Martha, I can't find Pup."

"Does Pup have to go, Billy?"

"Oh, Aunt Martha," eloquently from Billy. "Well, I don't think grandpa'd enjoy it much without him."

Aunt Martha laughed.

"What about Billy boy?" she asked.

"Well, I know I wouldn't enjoy it without him." More vigorous whistling. Then from Aunt Martha:

"Billy, we can't wait any longer. I'm afraid we'll be late anyway; and grandpa simply must not miss the parade. You know this is his special day. We'll just have to leave Pup at home."

"But maybe he's lost."

"No such good luck, Billy. He's after a gopher somewhere in the grove, and he'll probably work at it all day. Come, we must be going or we'll surely be late for the parade."

"Maybe Mr. Peters' folks will come by for us if we wait."

"No, they're going to stay at home today. They don't celebrate Memorial Day. And Baxters have gone to the beach. I guess we'll have to walk, and I'm afraid grandpa'll be tired."

"Now, Martha. Do I look as if I were likely to faint by the wayside? All I'm worrying about is, I wish Phil could go too."

"Yes, so do I. I wanted to stay at home and attend to the irrigation, but he wouldn't hear to it. But of course I'm glad we are to get the water today, for the grove certainly needs it."

The three of them were on the way by this time, grandpa and Aunt Martha still discussing the little grove which contained practically all their worldly possessions. Grandpa Brown's widowed daughter, Martha Gray, was his housekeeper and general business adviser. Phil, her youngest brother, had lost his health several years ago following the death of his wife, and they had all sold their modest possessions and come to California, hoping he would be benefited by the change. They had sufficient funds to buy this little five-acre orange grove, but with no surplus to speak of. They had succeeded in keeping the grove in good condition, and had managed to live, with most of the necessities of life but none of its luxuries, until this winter when their entire crop had frozen and been carted off to the dump. It had left rather a discouraging outlook for the little family of four. Phil's health, though improved, was not yet sufficiently rugged that he could do hard work of any kind. And they were working on the principle that it pays to keep up an orange grove. They had put back into the grove practically everything they had taken off in the way of crops, and just how they were to tide over until another crop would be ready for the market was their problem.

Grandpa and Martha were discussing these things on the way to the Memorial Day celebration. Grandpa, at 75, was still hale and hearty and often walked the two miles to the little town.

As they left the grove, Billy kept his eyes open for Pup. Usually nothing pleased Pup more than a trip to town with Billy and grandpa, but today he was engaged in the fascinating pursuit of digging out a gopher, the dirt flying out in showers from under his frantically digging feet, while little short, low barks proclaimed his excitement. To be sure, he never had dug out a gopher, and he had worked at it many a time long and faithfully, with enthusiasm worthy of a better cause; but he was still hopeful.

Billy whistled, and whistled, and whistled. Farther and farther away it sounded to Pup, who gave a final longing look at the hole he was digging—such a nice, deep, cool hole—and decided it could wait, while evidently Billy and Grandpa couldn't, and went tearing after them, flinging himself at them with every indication of frantic joy at the prospect of accompanying them; then making wide detours to be sure he didn't miss anything interesting by the way.

Suddenly the warning toot of an automobile horn close behind them sent them all scrambling for safety to the side of the road, as a comfortable looking automobile glided slowly past and came to a stop a few feet ahead of them, while the pleasant-faced, middle-aged man in the driver's seat called back, "Can I give you a lift?"

"We are just going into town to the celebration," explained grandpa. "But we'd be glad of a ride. We were a little late getting started. Pup, here, had a previous engagement with a gopher, and delayed our start."

The interested glances of the two occupants of the car proclaimed them dog lovers, and the pretty lady on the back seat said, "We've a place here that will just fit Pup," as she opened a gate on the car step that spoke of previous dog occupancy. Grandpa was getting into the front seat, while the lady on the back seat made room for Aunt Martha and Billy beside her, and Pup sprang into his place, entirely at home apparently, and enormously pleased with the arrangement, barking his delight as the car started up.

And then grandpa was telling the man about the celebration; how the "boys of '61" were to head the parade, and there were to be a number of bands from near-by towns, all of whom were celebrating together, with an orator from Los Angeles. Afterward they were to separate and decorate the graves of their dead comrades in all the different cemeteries. And as the man listened to grandpa's enthusiastic recital of the plans for the day's celebration, he turned to the young woman on the back seat:

"How would you like to spend the day here, Frances, and take our friends home afterward?"

"Fine, Father. I would like to see the celebration," and so it was arranged, the man explaining that they were tousists, sight-seeing in a leisurely way, with nothing to hurry them back to Los Angeles. Then he produced a business card which read: "George E. Burnham, Denver. Securities." Grandpa passed the card back to Martha, who having read it said "So you still live in Denver, do you?" Mr. Burnham turned a startled face toward her. "Yes, I have lived there practically all my life. And of course I should remember you. There has seemed something familiar about you ever since I first saw you, but you see, there in the back seat you have the advantage of me. I've not had a good look at you." He turned and scrutinized her closely and a smile proclaimed his recognition. "U-huh, Martha Brown, of course. And you haven't changed much. How are you?" shaking hands warmly. After general in-

troductions were acknowledged he continued: "It's a long time since I heard of you. Then it was in Texas, wasn't it, or Arizona?"

"Yes, we've drifted around quite a lot. First my husband's ill health, then my brother Phil's, Billy's father. And what about you?"

"Oh, I've stayed right on the job in Denver. My wife died ten years ago. Since then Frances and I have traveled a good deal, but we always return to Denver. This year we thought maybe we might find some place we would like better. We happen to be almost entirely foot-loose, so we thought it a good time to make a change. We came to California with no very definite idea in mind, but sort of hoping we might find an orange grove that would suit us.

(To be continued.)

HINTS FROM HOUSEKEEPERS

To Remove Calla Lily Stain

Obtain a bottle of Clorox from any grocer. Pour a little in a saucer. Rub stain in cold water, then wet it thoroughly in Clorox, rub between fingers and rinse in cold water before boiling. This applies only to white clothes. Clorox will also remove all fruit stains. (In reply to query in Cultivator of April 16.)—Mrs. N. J. Mitchell, King City.

Nuttose

Here is a splendid spread for sandwiches, or may be cut like cheese and eaten: 1 cup nut butter (peanut), 1 cup water, 1 cup tomato juice, 1 teaspoon salt and sage, 1/3 cup flour. Mix and steam for two hours.—Mrs. R. E. Tong, Modesto.

Calla Lily Stain

Calla lily stain can be removed by using Sanford's Ink Eraser. Comes in liquid form. May have to use it more than once, but it will remove calla lily stain. (For Riverside Subscriber.)—Mrs. F. Stites, Escondido.

Here Is Poem Requested

Am enclosing the poem, "There's but One Pair of Stockings to Mend Tonight," that some subscriber asked for. Am glad that I had it to send. Surely do enjoy the Cultivator, especially the "Household Department."—Cora L. Ferrell, Banning.

THERE'S BUT ONE PAIR OF STOCKINGS TO MEND TONIGHT

An old wife sat by her bright fireside,
Swaying thoughtfully to and fro
In an easy chair, whose creaky craw
Told a tale of long ago;
While down by her side, on the kitchen floor,
Stood a basket of worsted balls—a score.

The good man dozed o'er the latest news
Till the light in his pipe went out;
And, unheeded, the kitten with cunning paws
Rolled and tangled the balls about;
Yet still sat the wife in the ancient chair,
Swaying to and fro in the firelight glare.

But anon, a misty tear drop came
In her eyes of faded blue,
Then trickled down in a furrow deep
Like a single drop of dew;
So deep was the channel—so silent the stream—
That the good man saw naught but the dimmed eye beam.

Yet marveled he much that the cheerful light
Of her eye had heavy grown,
And marveled he more at the tangled balls,
So he said in a gentle tone:
"I have shared thy joys since our marriage vow,
Conceal not from me thy sorrows now."

Then she spoke of the time when the basket there
Was filled to the very brim;
And now, there remained of the goodly pile
But a single pair—for him;
Then wonder not at the dimmed eyelight,
There's but one pair of stockings to mend tonight.

I cannot but think of the busy feet,
Whose wrappings were wont to lay
In the basket, awaiting the needle's time—
Now wandering so far away;
Now the sprightly steps to a mother dear,
Unheeded fell on the careless ear.

For each empty nook in the basket old
By the hearth there's a vacant seat;
And I miss the shadows from off the wall,
And the patter of many feet;
'Tis for this that a tear gathered over my sight,
At the one pair of stockings to mend tonight.

'Twas said that far through the forest wild,
And over the mountains bold,
Was a land whose rivers and darkening caves
Were gemmed with the rarest gold;
Then my first born turned from the oaken door—
And I knew the shadows were only four.

"Another went forth on the foaming wave,
And diminished the basket's store;
But his feet grew cold—so weary and cold,
They'll never be warm any more.
And this nook, in its emptiness, seemeth to me
To give forth no voice but the moan of the sea.

"Two others have gone toward the setting sun,
And made them a home in its light,
And fairy fingers have taken their share
To mend by the fireside bright;
Some other basket their garments will fill—
But mine, ah, mine is emptier still.

"Another—the dearest, the fairest, the best—
Was taken by angels away,
And clad in a garment that waxeth not old,
In a land of continual day;
Oh! wonder no more at the dimmed eyelight,
When I mend the one pair of stockings tonight."

Mrs. Howles—I've decided that Edith shall have her voice trained in Europe.

Howles—Certainly; but isn't there some place in Asia?—Boston Transcript.

TIMELY MEMORY JOGS

With the coming of warm days the popularity of the bathroom increases. If you haven't yet installed the new tub or tank you promised yourself last summer, now is the time.

A very satisfactory shower bath may be enjoyed in the ordinary bathtub by purchasing short length of hose with spray nozzle for attaching to the bathtub faucet. These shower sprays are a quickly acquired habit, especially by the boys and men of the family. They are very inexpensive.

After a hot, dusty drive or a hot, dirty day in the field or garden, the one most refreshing and restful thing is the hot bath or the cold shower—or both. Appliances from the simplest to the most luxurious are available for supplying this comfort to every home in the land. The Cultivator will be glad to furnish suggestions for installing water system or appliances to fit your individual needs. What are they?

Hot water tanks can be supplied with heat from kitchen range, from separate gas, gasoline or oil stove or from the sun's heat—no reason why anybody should go without.

Canning time is almost upon us. Are you supplied with all things needful? Look over your shelves—cans, tops, rubbers, funnel filler, preserving kettle, pressure canner—whatever you intend to use.

Manufacturers have been busy perfecting small canners for home or small business use. There has been a great demand for the small canners from all parts of the country.

Also there are a number of small household or commercial fruit evaporators now in the market. The use of these has increased so rapidly that the manufacturers are just beginning to catch up with the demand.

Last—and least in size—have you fruit knives that will cut? A few cents will secure a knife of good steel that can be kept sharp. It is small economy that makes much labor to have in the family one (maybe) good sharp fruit knife and an odd one or two that is kept because "it's too good to throw away"—but no good to cut with.

The *No. 2C Autographic*
KODAK, Junior

equipped with
Kodak Anastigmat
f.7.7 lens and Kodak
Ball Bearing shutter

$25.00

This Camera fits into a niche, all its own. The size of the picture it makes, 2⅞ x 4⅞ inches, is particularly pleasing; is almost up to the full post card size—and yet the camera itself is small, light, convenient.

The Kodak Anastigmat lenses are made to exactly fit Kodak requirements. They are not merely an adaptation of a lens to the Kodak. They are a Kodak product designed to fit Kodaks, and in each case designed with particular reference to the size and type of Kodak and Kodak shutter that they are to be used with. The *f*.7.7 lens used on the *2C* Kodak has more speed than the best of the rectilinear lenses and is at least equal to the best anastigmats in depth, sharpness and flatness of field.

The Kodak Ball Bearing shutter has speeds of 1/25, 1/50 and 1/100 of a second for "snapshots", has the usual time and "bulb" actions for prolonged exposures. It is an unusually reliable shutter, works smoothly and is quiet in its action.

The No. 2C Junior is covered with genuine grain leather, is finely finished in every detail, is extremely simple in operation, is "autographic", of course and, with the Kodak Anastigmat lens, produces negatives having that crispness and sharpness that are characteristic of the true anastigmat.

The price, $25.00, includes the excise war tax.

SETTLING CHILDREN'S DISPUTES

It happened one day between the little folk in the kindergarten room, but it set the older folk to thinking.

Kindergarten had not yet started, and Tim, a little fellow of three and a half, walked over and took the oak chair that Clifton, aged five and a half, had placed beside the table for work. When Clifton realized what had happened, a tug of war began, and the two children were soon joined by others, most of them to aid little Tim.

The kindergarten teacher stopped what she was doing and gave her attention to the group and, although she might have stepped over and put an end to the struggle, she only stood by and watched.

It looked as though the trouble would never end, and as though some one might be hurt, but still she did not interfere; she only looked on, ready, however, to take a hand if it became necessary.

At last one of the older boys was called to help. He studied the situation, observed that the fuss was over an oak chair, and that there was one more oak chair in the room; he solved the problem by offering the vacant chair to little Tim, and all was settled to everyone's satisfaction. The teacher heaved a sigh of relief, and gave a smile of approval; it was a step in the children's development, one well worth while.

Why can't children settle more of their own disputes? Isn't it because we interfere too often instead of giving them a chance to work out their problems for themselves?

IT PAYS TO TEST RUBBER RINGS

The United States department of agriculture gives a number of tests which may be used to determine whether a rubber ring has the requirements that it should have or not. One is the stretching test.

A six inch piece is cut out of a ring; take hold of the end so there are four inches between the fingers. Stretch the piece along a ruler until the fingers are ten inches apart. The sample should not break and should return to its original length. The tensile strength test is as follows: Fill a light weight pail with one gallon and seven pints of water (total weight approximately 17 pounds). Place the jar ring around an empty spool; pass a wire through the center of the spool and fasten to handle of the pail; then pass the round handle of a wooden spoon or broom through the ring and lift. The ring should not break. If rings will stand these two tests, they are not likely to give trouble in canning.

CLEANING CLOTHING

People were just beginning to learn that ether was very useful in removing grease spots from clothing and other textiles when the war created a shortage of it and gasoline again had to be resorted to, notwithstanding it had doubled in price and left a residual odor on the goods that wasn't pleasant.

For a long time ether has been used in cotton and woolen mills for removing spots from new cloth. It can be purchased in drug stores in half pound cans. It is not expensive, but is very volatile. After taking the required amount from the can, the container must be tightly closed as soon as possible, otherwise our cleaner dissolves into thin air.

Ether is inflammable and should not be used anywhere near open flame or open fire, nor in a closed room where the ventilation is not good. The same care should be exercised in its use as in the use of gasoline, benzine and like products.

BEEMAN Multi-Service Tractor

Cheapest to buy
Cheapest to operate

You can not only buy a BEEMAN Tractor for less money, but it costs less to operate this powerful small tractor. It is compact and easy to control. Runs exactly where you want it and travels at the proper speed, cultivates narrow rows and is always "on the job."

It is a 4 h. p. stationary power plant besides. Operates for 8 cents per hour in field and 4 cents per hour belt work.

The new improved BEEMAN is the best tractor buy on the market.

PETALUMA COW TESTING PROGRESS

C. B. Wiborg, tester, makes the following interesting report of the Petaluma unit of the Sonoma County Cow Testing Association:

During the month of March there were 1,365 cows tested, 426 making 40 pounds fat or more.

The average for the entire 1,365 cows was 874 pounds milk and 35.9 pounds fat.

Five herds in which the entire herd averaged over 40 pounds of fat are given in the table below, also the record of the best cow, as follows:

A. Purvine—Jersey 37	49.6	83.4
M. Mordecai—Jersey 40	44.0	77.5
D. McClure—Jersey 35	42.2	64.2
U. Martinelli—Holstein 62	40.9	58.6
A. Volkers—Holstein 42	40.3	82.8

Note.—The first column of figures indicates the number of cows in the herd, second column the herd average, and third the high cow of the herd.

A cow is simply a machine for converting feed into milk, and it is just as expensive and wasteful to keep two cows where one could produce as much, as it would be to keep four horses where only two were needed, or two trucks where one could do the work. The cow testing association is the easy way for dairymen to select the best machines for producing milk.

There is a big improvement noticeable in most of the herds in the cow testing association compared to three and four years ago. Unfortunately, some dairymen do not use the information obtained and are making no progress.

The cow tester simply furnishes the information. It is up to the owner of the herd to use it.

E. E. Greenough of Merced sends records of some of the Jerseys of his Sunshine Farm: Patsy of Sunshine Farm 438169, age 21 months; lost one quarter of udder soon after start of test; milk 5,072.5 pounds, fat 252.46 pounds; days in milk 362. Beauty of Sunshine Farm, 409731, age one year 11 months; milk 7,934.2 pounds, fat 430.33 pounds; carried calf 247 days. Goldie of Sunshine Farm, age senior two year old; milk 6,825.1, fat 323.27; carried calf 240 days; days in milk 363. Edna of Venadera's Birdie, 373694, age four years nine months; milk 8,701.5, fat 510.66; carried calf 285 days; days in milk 338. Lorna of Venadera's Brownie, 373693; age four years nine months; milk 8,079.5, fat 485.53; days in milk 305; carried calf 235 days.

Grow Shorthorn Cattle

With all grain and hay markets demoralized and an acknowledged shortage of beef cattle in this state and throughout the West, your best chance for profit is to grow good livestock. The better the livestock the greater the profit. Shorthorn cattle acknowledge no superior. The business is sound and the men engaged in it are prosperous. There is a wide market in this state for Shorthorn breeding stock.

Here Is Your Profit

A Shorthorn steer will have much greater weight and much better quality than a common steer and sell for more dollars per hundred. Is it not good business to raise the sort that weigh 1500 pounds at three years old instead of 1000 or 1200—and do it on the same feed and care?

Why Not Purebreds?

A registered Shorthorn cow will return from two to four times as much as a grade. Raising Shorthorns does not require heavy investment in equipment or labor and is not confining. There never was a better time to enter the business than right now and the opportunity is provided in the

Third Public Sale
Caledonia Farms Shorthorns
West Sacramento, Cal.
Wednesday, May 25
50 Bulls and Females

40 Cows The female end of the offering contains many individuals that we would like to keep in the herd. About half are Scotch including Acanthus, Orange Blossom, Roan Lady, Mina, Rosa Hope, Ury and other good tribes. The balance are strong American sorts. All are either bred to or sell with calves by:

Imp. Caledonia
Gainford Matchless
Pine Grove King

10 Bulls Among the bulls, six are Scotch. All are well grown and excellent type. Several are herd bull prospects. Here is a rare chance for the small breeder or the range man.

All are guaranteed breeders. Each lot sells tuberculin tested.

The catalog is ready.

Palo Alto Stock Farm, Holsteins: Alta Pappoose, 2929 pounds milk, 118.93 pounds butterfat; Alta Joh Princess, 2523, 107.72; Thelma Hart Sunl. DeK. 4th, 3036, 97.83; Irene Segis Pont., 2795, 84.41.

F. F. Pellissier, Holsteins and grades: Princess Tolia W., 2365 pounds milk, 80.41 pounds butterfat; 2423, 2223, 77.81; 862, 1578, 77.32; 2416, 2189, 76.62; 2403, 2111, 73.89; Mamie Pont. 2083, 72.91; 1899, 1968, 72.85; 1917, 2158, 71.71; Brudorin, 2018, 68.61; 1943 1618, 59.87; 1681, 907, 59.12; 2373 1299, 57.16; 2065, 56.49; 1946, 1473 55.97; 2479, 2006, 54.16; 921, 1386 52.67; 1989, 1609, 51.49.

Olga Saxer, Holsteins: Moorland Col. Rose, 3301 pounds milk, 95.05 pounds butterfat.

University of California: Ramona grade Holstein, 1661 pounds milk 57.45 pounds butterfat; Cal. Questa Queen, Guernsey, 1079, 52.66.

J. E. Thorp, Jerseys: Silver Tips 1314 pounds milk, 55.84 pounds butterfat; Sonny's Benedita, 1089, 51.49.

H. L. Wakeham, grade Jerseys: Jap 1308 pounds milk, 61.49 pounds butterfat; Wild Cow, 921, 60.77.

R. H. Walrath, grades: Minnie 1448 pounds milk, 65.16 pounds butterfat; Pansy, 1603, 59.31.

G. W. Walters, grade: Gaylord 1110 pounds milk, 63.27 pounds butterfat.

Warne & Sons, Holsteins: Bessie Abbek. Col. 2d, 2039 pounds milk, 70.1 pounds butterfat; Bertha Pont. J. 3d 1994, 67.01; Miss Flora Jul., 2074, 62.42

The reports for March so far received show that 372 cows in milk during the full month produced an average of 1,233 pounds milk and 49.8 pounds butterfat during the month. (Average number of days in milk at beginning of month, 110.)

Two cows produced over 100 pounds of butterfat during the month, both Holsteins and owned by Palo Alto Stock Farm., viz., Alta Pappoose 118.93 pounds, and Alta Johanna Princess 107.72 pounds. The former yield is equivalent to nearly 4½ pounds of commercial butter for each day of the month, a very remarkable production. Four cows produced between 90 and 100 pounds butterfat during the month, 14 between 80 and 90 pounds and 23 between 70 and 80 pounds.

The California Cultivator prize for March was won by F. F. Pellissier of Whittier for an average production in five grades of 75.70 pounds fat (ranging 72.9 to 77.8 pounds). This is the sixth time since the competition commenced last September that this prize has been awarded to Los Angeles County dairy farmers. During the past month grades in 18 different herds in the state competed for the prize, ranging in average production from 75.7 to 26.7 pounds. These herds were located in nine different counties, Humboldt County being represented by seven herds and Los A

geles County by four herds, with single representatives in seven other counties.

Entries in the state dairy cow competition closed on March 31 with a total enrollment of 1,308 cows, of which 761 were entered in competition for monthly or ten month records, and 647 for yearly cow testing association records. Among the former, 261 were pure breds and 500 grades or common cows, while the latter included 24 pure breds and 523 grades. The different breeds were represented as follows, among the pure breds: Ayrshires 6, Guernseys 36, Holsteins 130, Jerseys 98 and Shorthorns 15; and among the grades, Ayrshires 6, Guernseys 62, Holsteins 224, Jerseys 536, Shorthorns 10, and common or scrub cows 186. The cows were owned by 64 dairy farmers located in 21 widely scattered counties, from Del Norte in the north to San Diego and Imperial Counties in the south. So far as distribution and scope are concerned, the competition is therefore all that could be desired and bids fair to become of the greatest value to the dairy industry of the state.

As previously announced, the competition will be continued until January 31, 1922; it is planned to make the announcement of records of production by cows in the competition and of the award of prizes at the Dairy Farmers Day during the Stockmen's Week at university farm in February next year.

THE SILO IS THE SOLUTION

By Ernest Braunton

The dairymen have accepted the silo.

It is essential to economical dairying.

It does away with the necessity of expensive root crops.

It makes it possible to have a uniformly balanced ration all the year 'round.

It renders the food succulent, palatable and digestible.

The silo properly located economizes labor.

It economizes forage by converting waste roughage into palatable and nutritious food.

It condenses great bulk into small space.

The silo simplifies the farm end of the dairy business to corn and sorghum and sunflower for the silo and alfalfa for the best and most palatable dry roughage.

Economical Crops for Silo

Our farm colleges have decreed that Indian corn is best, but something with more sugar content is desired, therefore saccharine sorghums may be used to blend with the corn. But these alone have too much sugar content which may cause acid fermentation. Non-saccharine or grain sorghums are used largely on ranches where the soil is not suitable for growing Indian corn.

A good sorghum to grow for the silo is the recently introduced Wonder Forage Plant; there are many attributes in its favor. It is believed to be a hybrid between Sudan grass and amber cane. It is semi-saccharine; grows tall, having seed and heads like amber cane, but stools and grows as rapidly as Sudan. More than 150 seed heads were counted on one plant from one seed which would indicate how enormously it stools and branches.

Tonnage per Acre

Paul Greening of Norwalk stated that a field average of 20 tons per acre was going some, yet it is obtainable. One grower reports a yield of 105 tons off three acres of Orange County Prolific corn. Eureka Ensilage, Mexican June or Branching corn will do as well. Many growers report 15 to 20 tons from Red Top, Honey and Silver Tip Sorghum. No one has yet reported actual tonnage from the Wonder Forage plant but Mr. McClellan of Lankershim says that from his ten acre field he cut two full grown crops the first season and that it grew all winter from the stubble. When the frost destroyed the young growth it required only a few warm days to recover and he pastured it all winter. Mr. McClellan cut it with an alfalfa mower.

With the conservative estimate of 20 tons per acre each cutting it would be easy to believe that this plant is destined to lead all others for the silo.

Sunflower

Owing to the large content of potash in sunflower and its adaptability to soil that will not grow corn or sorghum, and because it is a good blend to make up a balanced ration in the silo, it should be planted more extensively. It is recommended by the California department of agriculture and by Prof. P. B. Kennedy, grass and forage plant investigations, University of California.

Storing Up Wealth

Silo on the ranch of Paul Greening near Norwalk, Los Angeles County.

WINS CALIFORNIA CULTIVATOR PRIZE

Five grade cows owned by F. F. Pellissier of Whittier had the highest average production of butter fat for grades in the state dairy cow competition during the month of March and the California Cultivator prize for this month was therefore awarded to Mr. Pellissier.

The production of the individual grades for the month was as follows:

	Days in Milk	Milk Lbs.	Butter Fat Percent	Butter Fat Lbs.
	25	2,223	3.5	77.81
	12	1,578	4.9	77.32
	24	2,189	3.5	76.62
	45	2,111	3.5	73.89
	86	1,969	3.7	72.85
Average	38	2,014	3.76	75.70

Grade cows in seventeen other dairy herds were eligible to compete for this prize during the past month. The average production of butter fat for these herds was as follows: Arden Dairy, El Monte, 67.52 pounds; Adohr Stock Farms, Van Nuys, 65.14 pounds;

This photograph of Pabst Virginia Johanna was taken while she was dry.

PABST VIRGINIA JOHANNA

Pabst Virginia Johanna, Junior two year old daughter of King Pontiac Champion has just completed a 305 days' record of 15229.5 lbs. of milk and 770.0 lbs. of butter, a *world's record* in this class.

This promising heifer is one of over 117 daughters of the noted Century Sire in the splendid herd at Pabst Stock Farm. Mr. Fred Pabst's 1350 acre farm at Oconomowoc, Wisconsin is a model of dairy farms, both in buildings and equipment—and in the magnificent herd of high producing cows, developed under the personal management of owner, Mr. Fred Pabst.

A WORLD'S RECORD *this time*

A Junior 2 Year Old World's Record Made on Pabst Stock Farm With a Pine Tree Milker

ONE after another come reports of new records made by cows milked by the Pine Tree.

State records, county records, now a WORLD'S record, and a 10-month record at that. A long trying test which called for every ounce of skill in feeding and milking—the acid test of a milking machine!

Great breeders, who formerly entrusted their test milking only to the most skilled herdsman, now put implicit faith in Pine Tree.

Nearly 50 high producing Holsteins are milked 4 times daily by the Pine Tree in the great test barns at Pabst Stock Farm. For over two years, in 4-time-a-day service, Pine Tree has never failed. Read Mr. Pabst's letter at the right.

Think it over, Mr. Dairyman! What does the Pine Tree's success in test milking mean to you? Maybe you're not after records. But you *are* after more milk. Breeders like Mr. Pabst are taking no chances in milking for production records. Their is no guessing in their work. When they use Pine Tree in their test milking you can bet they are getting more milk or they wouldn't be doing so.

The fact that the cost of machine milking is only one-half of that of hand milking is recognized by every dairyman. These records are the final proof that Pine Tree also increases production.

Send today for our booklet on Pabst Stock Farm and their recent records. Learn how great breeders save money in test work and make greater records with Pine Tree. Your copy is Free—write for it TODAY!

Pine Tree Milking Machine Company

Dept. 3025, 2843 West 19th Street, Chicago, Ill.

Oconomowoc, Wis., Jan. 21, 1921.

Pine Tree Milking Machine Co.
2843 W. 19th St., Chicago, Ill.

Gentlemen:—

I take great pleasure in stating that the Pine Tree has been in use here for about two years. It has given us absolutely no trouble, and has helped to do work which we could not have done at the time labor was scarce.

We are using your machine on many of our test cows. Pabst Virginia Johanna, as a Junior 2-year old, made 15229.5 lbs. of milk and 770 lbs. of butter in 305 days, which so far is the world's record. Pabst Pontiac Aaggie made 25915.8 lbs. of milk and 1178 lbs. of butter in 365 days, being milked on your machine. Yours very truly,

PABST STOCK FARM
Fred Pabst

PINE TREE MILKER

Napa State Hospital, Imola, 64.32 pounds; W. F. Early, Grizzly Bluff, 60.75 pounds; R. H. Walrath, El Centro, 52.33 pounds; Peter Iversen, Grizzly Bluff, 50.38 pounds; J. M. Christen, Pacheco, 49.18 pounds; C. E. Fisher, Hughson, 48.75 pounds; S. G. Gambonini, Petaluma, 47.77 pounds; C. L. Mitchell, El Monte, 41.76 pounds; University Dairy, Berkeley, 40.21 pounds; C. F. Holman, Stockton, 27.66 pounds.

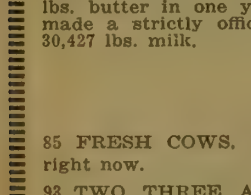
Five other herds had grades eligible to compete for this prize which were not however in milk during the entire month. These herds were: Peter Iversen, Grizzly Bluff, average production 50.38 pounds (24 days only); J. B. Harbers, Waddington, 42.41 pounds (27 days); Leo Christen, Waddington, 41.51 pounds (21 days); W. Terkelsen, Ferndale, 40.83 pounds (24 days); and Giacomini & Pedrotti, Waddington, 39.52 pounds (27 days).

Italian Vineyard Company
Big Type Berkshires

Some dandy young boars for herd headers. The choicest breeding and ready for service.

Every one tuberculin tested and cholera immune.

Alex. M. Wilson, Supt. **Guasti, Cal.**



This one and three other daughters of MYRA'S MISSIONARY are a part of 40 head of R. of M. Jerseys to be offered by Mr. Warren Gray of Jefferson, Oregon, at Public Sale at the farm in June. A splendid lot of high producing females. For catalogue and further information, address,

Chas. M. Talmadge, Sale Manager, Box M, Salem, Oregon

THE LARGEST COW TESTING ASSOCIATION IN THE WORLD

By C. V. Castle

The Ferndale cow testing association in Humboldt County is not only the largest but one of the oldest in the United States to continue in successful operation. J. W. Coppini, a successful Jersey breeder, is secretary-manager, and to his good management no little credit is due. The association has now started on its 13th year. Mr. Coppini states: "To the efficient work of the testers is due in a great measure the success of the association." The testers are C. A. Casanova, now on his eighth year with the association; Bruno Kaehler, now on his sixth year, and Carl Helgested, now on his fourth year.

This association tested as many as 4,546 cows last year, and 106 members, owning from two to 150 cows, finished the year's work. Twenty herds comprising 532 cows were either sold during the year or discontinued testing; 4,014 cows finished their year's work with an average lactation period of 9½ months and with an average butterfat production of 334.03 pounds per cow. There are but very few associations anywhere that can equal this average production, and none that can both approach it in number of cows and height of production.

The large majority of the cows considered in the association are grade cows and their high production is directly traceable to the high class pure bred sires that have been in use in Humboldt County for many years, and to the raising of heifers from the good cows found by the testing association work.

Of considerable interest is a comparison of the report of 1909 with that of 1920. In 1909, 581 cows finished their year in the association with an average production of 251 pounds of fat. This year the average of 4,014 cows was 334 pounds, a difference of 83 pounds of fat per cow. Based on the number of cows finishing this year that difference means a total of 333,162 pounds of fat, which, at the price of 70 cents per pound, the average price paid Humboldt County dairymen in 1920, amounts to $233,213. Even at present prices of 40 cents per pound for butterfat, this increase in average production means $133,264 per year to the 106 dairymen in the association, or an average of over $1,250 per year per man, as a direct result of cow testing association work.

Moneymakers For Dairymen

With an abundance of cheap feed on hand, the time is particularly favorable for the establishment of new herds of registered Holsteins. The great demand and consequent shortage of good grade Holstein cows has advanced the price to a point where many practical dairymen may well consider the purchase of registered purebreds, even though the initial investment may be larger per head.

In the public sale outlined below there will be a wonderful opportunity not only to secure splendidly bred registered Holstein cows, but to buy the sort that are just right to start paying for themselves right away, for the offering contains an unusual number of fresh cows and heavy springers. In addition to this especial attention is here directed to the fact that the owner is prepared to extend more liberal terms than found in the usual sale, and such arrangements should be made with him well in advance of sale day.

177--Registered Holsteins--177

167 Cows 10 Bulls

Willowmead Herd Owned by James McGillivray **Sacramento, Cal.**

Wednesday and Thursday, May 18-19, 1921

WILLOWMEAD HERD now contains over 500 registered Holsteins of which number approximately 475 are females. This sale will positively include every cow in the herd that is in salable condition, and every one of the 167 females to be sold is either milking or a heavy springer.

Consider also that in addition to the fact that the females in this herd represent some of the very greatest producing families of the breed, a very large percentage of them are bred to one or the other of the two Willowmead herd sires, both of which are backed by world's record production. These are the two bulls to which more than half of the females are bred:

COLONY ZARILDA NEWMAN, sired by Aaggie Cornucopia Newman, son of the former world's record milk producer, Margie Newman, and out of the famous Canadian cow Zarilda Clothilde 3d De Kol, 33,153.6 lbs. milk and 1,194.18 lbs. butter in one year, and at a previous freshening she made a strictly official record of 1,070.23 lbs. butter from 30,427 lbs. milk.

PRINCE ECHO SYLVIA SEGIS, sired by Champion Echo Sylvia Pontiac, son of May Echo Sylvia, the only cow that ever made over 1,000 lbs. milk in 7 days. His dam is a 29.89 lb. 4 year old daughter of King Pieter, second dam a 31.70 lb. daughter of King Segis. He is a beautiful individual, and his service adds value to every cow in calf to him.

Among the Females in the Offering Are:

85 FRESH COWS, splendidly bred and producing heavily right now.

93 TWO, THREE, AND FOUR YEAR OLD HEIFERS, out of the best foundation cows in the herd and sired by bulls of splendid breeding.

28 DAUGHTERS OF DUTCHLAND SIR KORNDYKE COLANTHA, a proven grandson of Colantha Johanna Lad.

18 DAUGHTERS OF KING PONTIAC RUBY BURKE, a proven son of King of the Pontiacs.

17 DAUGHTERS OF PRINCE BUTTER BOY WALKER, a proven yearly record son of Prince Gelsche Walker.

14 DAUGHTERS OF KORNDYKE COLANTHA PARTHENEA, son of Dutchland Sir Korndyke Colantha and the great foundation cow Minnewawa Louise.

10 DAUGHTERS OF KING MEAD OF RIVERSIDE, the famous sire of yearly record producers.

COWS AND HEIFERS with records up to over 32 lbs. butter in 7 days.

DAUGHTERS of cows with up to over 32 lbs. butter in 7 days and up to over 1,000 lbs. butter in one year.

THIS OFFERING CONTAINS THE LARGEST NUMBER OF REGISTERED HOLSTEIN FEMALES OF MILKING AGE THAT HAS EVER APPEARED IN A WESTERN SALE. IT IS A WONDERFUL OPPORTUNITY TO PURCHASE FEMALES THAT START TO PAY FOR THEMSELVES THE DAY YOU GET THEM HOME.

The owner is prepared to extend liberal terms to responsible parties. Applications for credit may now be made either in person or by letter to JAMES McGILLIVRAY, R. 1, Sacramento, California.

Every animal positively guaranteed to be a breeder. No tuberculin test certificates.

FEEDING GRAIN TO COWS ON PASTURE

Does it pay to feed grain to cows on pasture? The answer is that it depends largely upon how much milk the cow gives and how good the pasture is.

If a cow is producing less than a pound of butterfat each day the necessary food can be obtained from a good pasture. If she produces more than this some grain can be fed with profit. This means that a Holstein should be able to get food enough from grass alone to make 25 to 30 pounds of milk daily and a Guernsey or Jersey about 20 pounds. It will pay to feed grain to all giving above this amount as it is impossible for the animal to gather sufficient feed in the form of grass.

To produce a pound of butterfat daily requires at least 25 pounds of dry material. Fresh pasture grass contains only ten to 12 pounds of dry matter in a hundred pounds, making it necessary for a cow to gather and digest from 200 to 250 pounds of grass to produce from 20 to 30 pounds of milk. It is clear from this that it is impossible for a really high producing cow giving 40 to 50 pounds daily to do so long on grass alone.

A cow yielding a pound and a half of fat daily should receive about five pounds of grain, and about seven or eight pounds of grain for two pounds of fat. When not more than five pounds of grain is needed, it may be corn, barley, oats, or any combination of grain that is cheapest. The grass supplies a good amount of protein so the danger of a shortage of this necessary material is not serious. With a high producing cow requiring more than five pounds of grain daily, a small amount of bran, linseed meal, or other high protein feed should be added.

These recommendations hold good only when pastures are good. In midsummer it will often be necessary to feed more grain to high producing cows or to give some silage or green feeds to help out the pastures.—C. H. Eckles, University of Minnesota.

J. I. Thompson, manager of C. Harold Hopkins' Straloch Farm, Davis, attended the Braywood Shorthorn dispersal sale in Iowa and secured the imported bull calf, Braywood Collynie. This youngster, a roan, was sired by the Duthie bred bull, Collynie Violet Star, and his dam is Imp. Victoria Regina from the Gordon-Oswald herd

Holsteins
May 11, Victory Herd, Carruthers.
May 18-19, James McGillivray, Sacramento.
June 9, Burr Farm and Agee Bros., Burr Farm, Los Angeles.

Shorthorns
May 25, Caledonia Farms, West Sacramento.
May 26, Howard Vaughn, Dixon.

Herefords
May 27, Finnell Stock Farms, Galt.

Ormondale Ranch, Redwood City, was represented at several of the recent Eastern Shorthorn sales and as a result a number of high class females were added to that already good collection. At the Braywood dispersal Imp. Luxury 42d, sired by the Gordon bull, Count Crystal, and with a white heifer calf at side, was purchased for $1,300. Queen's Violet and Mildred's Beauty were selected at $500 each.

W. M. Caruthers of Live Oak is now able to answer the question "How long is a brood sow profitable?" Recently two of his Berkshire brood sows, each nine years old, farrowed and are raising litters of six pigs each. The two sows are daughters of the famous old boar, Rival's Champion, and the pigs are by a grandson of Rival's Champion. Mr. Carruthers is rapidly increasing the size of his Berkshire herd and plans to retain the sow pigs of these two litters as the blood lines are extremely popular.

Poppy's Dorothea, the world's record three year old Jersey, recently died at the home of her owner, Frank Lynn, Percyvale, Oregon. Dorothea's milk record was 17,800 pounds.

The 1921 Dairy Congress will be held at Waterloo, Iowa, September 26 to October 2.

Alec. D. McCarty, former president of the California Swine Breeders Association, has returned from an extended trip to the Hawaiian Islands, and his friends will be greatly pleased to learn that he has practically regained his health. Mr. McCarty has been an influential factor in the development of the swine industry in this state and it is hoped that he will again interest himself in the breeding of Poland Chinas.

The animal husbandry department of the college of agriculture has made arrangements with government officials to care for and stand at public service the Thoroughbred stallion, Gun Rock. Gun Rock is a son of the noted Rock Sand. The services of this horse are now available to those interested in the production of light horses.

Ferlotte of Paicines, a registered Percheron mare owned by the college of agriculture, died recently from blood poisoning that developed shortly after foaling.

Professor Gordon H. True, head of the animal husbandry division, University of California, who has been on a year's leave of absence, is expected to return July 1.

E. S. Reed, a former breeder of Hampshires and Durocs in the Eastern states, has just received at his Artois ranch two exceptionally fine Hampshire sows from the East by express. These sows are bred to High Victor, combining the blood of Blythedale Jim and DeKalb King 100th.

In alfalfa mowing time, during the past year, visitors to the Johnson Dairy Ranch near Hains Station have been surprised at the work of a Midwest Utilitor. Hooked to a 36-foot field mower, the little tractor was almost lost to sight in the heavy stand of alfalfa. But it easily pulled the mower, and cut more than an acre per hour; afterward it handled an 8-foot field rake to gather the crop. Special hitches permitted the driver to ride on this implement. A gallon of gas furnished power for eight hours work.

During the past year the Utilitor has been extensively introduced in California, and today happy owners may be seen using the machine for practically every kind of work formerly done with a horse. It is apparently as well at home on the big ranches as on the small farms of half an acre.

Bridgford Holstein Company's
Records 1920-21

	Butter 365 days	Milk 365 days
Adirondac Wietske Dairy Maid	1,295.11	31,900.0
Fairmont Pauline De Kol 2d, at 4 yr. 2 mo., 7 days Butter 39.15; Milk 711.9	1,108.69	26,117.9

Miss Konigen Pontiac, at 3½ yr.	966.1	23,363.9
Spring Farm Pontiac Maid 2d, in 297 days 918.1 lbs. Butter; Milk 20,532.6	918.1	20,532.6
Average	1,045.44	25,635.3
Karlray Ormsby Alcartra, 2 yr.	915.77	22,950.1
Mercedes Hengerveld Abbekerk, 2 yr.	908.27	18.160.2
Miss Korndyke Mercedes Abbekerk, 2 yr.	758.27	18,900.8
Modesto Korndyke Abbekerk, 2 yr.	772.12	16,215.4
Susie Segis Alcartra Abbekerk, 2½ yr.	781.2	15,921.3
Average for year	827.13	18,415.6

All daughters of our herd sire, King Segis Alcartra Abbekerk.

Following are some of the daughters of King Segis Alcartra Prilly; his first to freshen, all first calf two-year-olds:

	Butter 7 days	Milk 7 days
Bessie Veeman Alcartra Prilly	24.27	460.5
Louise Alcartra Prilly	23.88	547.4
Jessie Fobes Segis Prilly	23.02	456.8

These heifers now on Semi-official test, have averaged for first four months 72.2 lbs. milk per day each.

The above are a portion of the records completed in our herd during the fiscal year ending April 30, 1921.

Our first year of yearly testing.

A majority of the yearly records were made under ordinary dairy conditions, on three time milking running out in corral.

BRIDGFORD HOLSTEIN CO.,
Patterson, California.

Sun flower silage a proved stock food

"Sun flower silage compares favorably with corn silage . . . . . It is palatable to cattle, sheep and swine. No objectionable odor is observed in milk of dairy cows fed sun flower silage. All beef cattle did well on it."—From University of Montana Bulletin No. 121.

Heavy Yields

From 10 to 22 tons per acre of sun flower silage were obtained by the Montana Experimental Farm. Nevada Experimental Farm got 23 tons of sun flower silage per acre and under the same conditions only 14 tons of corn silage per acre. The Mammoth Russian Sunflower has generally proved the best variety. We will gladly send you a list of the latest government and state bulletins telling of this cheap, nutritious, easily-handled, new stock food.

The Highest Price Ever Paid in California

for ownership of a Holstein sire was for a son of Miss Valley Mead De Kol Walker, 36.80 lbs. butter in 7 days at 3 years of age, 1113.57 lbs. butter in 365 days. She held the world's records in three different classes for production and is without doubt one of the greatest individuals ever bred in the state.

The Highest Price Ever Paid for a Half Interest

in a Holstein sire in California was for another son of the same cow.

Of the six leading herds in Southern California headed by sons and grandsons of this great cow, only one has HER GRANDSON, HER BROTHER FROM THE SAME WORLD RECORD DAM, AND A BROTHER OF THAT DAM.

Los Angeles County Farm
Hondo, California

For Profitable Durocs

As we have sold out of bred sows and gilts, we are now offering big growthy fall pigs, either sex, at attractive prices.

Route 1 Visalia, Cal.

Live Oak Stock Farm

"Live Oak Stock Farm" is a comparatively new name among California Holstein breeders. but the farm is making rapid progress toward one of the best. Great care has been exercised in the selection of the foundation stock. The owners have been two years in getting together a herd which is a credit to the state and a recompense to the efforts and hard work on the part of A. B. Spooner and his right hand man, H. A. Smith.

On Live Oak Stock Farm

In the background is shown part of the milking herd in pasture. In foreground is shown the junior herd sire, Karlray Pontiac Tola Joe, owned by A. B. Spooner.

The pride of the farm is the junior herd sire, Karlray Pontiac Tola Joe. He was purchased when only six weeks old for $5,000, and is a double cross of the only double century sire, King of Pontiacs. His sire is the well known King Korndyke Pontiac 20th. The dam, K P Tola-Joe, was the state champion at two years with 27.148 pounds butter and 459.1 pounds milk in seven days. She is by King of the Pontiacs out of Tola Joe Gelsche.

All the young heifers were bred to Tola last year and the calves are beginning to arrive, showing exceptional quality and vitality.

There are some 50 head of young heifers, ranging from calves to coming two year olds. All are of uniform type and in excellent condition. Besides all the milk the calves can handle they get ground barley and oats and plenty of grass or hay. Most of these heifers are from the senior herd sire. Segis Skylark Karlray, the herd sire, is by King Segis Pontiac Jannek, formerly the Jeffries herd bull, famous through the show records of his daughters. The dam, Sir Skylark Ormsby Hengerveld Pet 2d, has twice made over 30 pounds butter in seven days and is now on yearly test with a good start. Though mostly black, the calves from this good bull are uniformly marked and exceptionally strong, vigorous calves.

The herd now consists of about 150 head. The foundation cows were carefully selected from some of Wisconsin's best herds. Fifty-four milking cows make up the present dairy herd.

The building and equipment are just reaching the stage where maximum results can be obtained and not long hence the Live Oak Stock Farm will be heard from. The farm proper consists of 750 acres located in San Luis Obispo County. All the labor is done by machinery, if possible, which helps to reduce running expenses and increases the efficiency. Practically all the feed is raised on the place.

The Live Oak Stock Farm is a pioneer in better dairy stock around San Luis Obispo, but through the efforts and backing of Messrs. A. B. and A. B. Spooner, Jr., with their assistant, Smith, success should be their reward.

The Stability of Pure Bred Livestock

By Frank D. Tomson

It is remarkable how many there are, lacking contact with the pure bred livestock business, who raise their voices when a decline in values is indicated as a charge against the industry. Strange as it may seem, there are countless numbers—but happily these numbers are being proportionately reduced—who should be producing pure breds of some breed, or at least using pure bred sires, who seem to take delight whenever a pure bred animal shows a shrinkage in value. I attribute this attitude chiefly to the inertia which has hold of such people and to the natural inclination which they evidently possess to desire to hold other people to their own level of activity and enterprise.

Then there come here and there publications setting forth a part of the truth, using for illustrations the practices of a few individuals and applying them to the fraternity as a whole, assuming that they are rendering a useful service.

Fortunately, in the main, people do their own thinking. A farmer ships a load of livestock to the market. He gets a low price. His commission man addresses him perhaps in this wise: "Jim, you think you got a low price for your cattle because this load across the alley sold for a higher price. But, look here, Jim; look at the kind of cattle this man has; look at their quality; see how uniform they run in type. Do you know, Jim, that if you brought the same kind of cattle here you would get the prices that this man does? The secret of the whole thing, Jim, is pure bred sires and good care."

So "Jim" gets a lot of education in that little talk. He observes that it is dollars and cents to him and he decides to make a change in his class of livestock. He gets a better bull and in looking around he becomes interested in good females also. He has taken an important step. Gradually he pays more attention to the individuality of his cattle. Perhaps he invests in some pure bred females for practical purposes. The next time he goes to market he has a different experience. He has found through actual experience that there is an actual advantage in the use of the better standards represented by the pure breds.

"Jim" is one of many thousands of farmers and all of the published propaganda and all of the adverse comment has no avail. It is a matter of profit or loss with "Jim" and his millions of contemporaries.

The way to produce extra pounds and improve the quality of those pounds is limited to the one channel of better standards of breeding animals. There is no other way. No amount of feed, no amount of care will avail more than a little if the first requisite—good breeding—is not provided. The livestock growers of this or any other country know now from observation and experience that the pure bred has a closer relation to farm profits than ever before. It has become practically indispensable. Values may rule high or low. There may be speculation or the lack of it, but the need for pure bred livestock on the millions of farms in the United States is as definite as the need of fertility in the soil.

There should be just as careful discrimination among pure breds as there is among animals of common breeding. It is the standard of individuality and responsiveness that is desired. Combine this with pure breeding and we have the best possible investment for any man engaged in

Enlarged view of Porcelain Lined—Easy to Clean—Bowl Chamber, open. Shows Self-Balancing Bowl hanging free from single bearing.

Self-Balancing Bowl

The Secret of Perfect Skimming

The Belgium Melotte is the only single-bearing-bowl ever made. This patented bowl hangs from one frictionless ball bearing and spins like a top. It is self-balancing. It skims as perfectly after 15 years' use as when new. Positively cannot ever get out of balance and vibrate, thus causing cross currents which waste cream by remixing with the milk. Six hundred pound Melotte turns as easily as 300 pound Separator of other makes. Spins for 25 minutes unless brake is applied. No other Separator has or needs a brake.

Belgium Melotte
Imported—Duty FREE

Invented by Jules Melotte — the Edison of Europe, stands first in Europe where every penny must be saved. Used on 90% of the Belgium dairy farms. Holds 268 international prizes. Admitted duty free by special act of Congress to save money for American farmers. The world's greatest Separator at a bargain price.

No Money Down

We don't want anyone to send us any money on the Melotte. We want to prove to you first that it is the best separator made. There are no papers to sign—no deposits or promises—no formalities. You are under no obligations. We take this liberal offer because we know a test of the Melotte will convince you.

$7.50 After 30 Days Free Trial

To convince you that the Belgium Imported Melotte is the best cream separator possible to buy anywhere in the world we will send one direct to your farm on a 30 day, absolutely unconditional free trial. Use it as if it were your own. Compare it with others—put it to every test. You alone are the judge. When the Melotte has sold itself on merit alone, send your $7.50 as first payment and make small monthly payments of $7.50 until the Separator is paid for.

Send for Free Book!

Don't buy any Separator until you have found out all about the Melotte, its 15 year guarantee and our 30 day free trial offer. Get our free book containing full description of this wonderful cream separator and the story of Jules Melotte, the inventor. Don't hesitate—don't do another thing until you write us.

mixed husbandry. The exacting requirements on the farms and as related to markets render imperative the production of the best types of farm animals obtainable regardless of the breed. The pure bred offers very much the safest investment. It will come nearer assuring adequate and permanent profits than any other of lesser worth.

The day of the pure bred is here and the millions of farmers are aware of it. The argument is all on the one side. Nor is it necessary that pure breds should soar to high prices in order to draw attention to their actual worth nor in the hope of encouraging further patronage. The chief concern of the breeder of pure breds is in my judgment the production of types that will meet all of the practical requirements and make the largest possible return on that basis.

REDUCTION IN DAIRY PRODUCTS

S. H. Greene of the California Dairy Council has been making investigations as to dairy production exports of various countries, using, to make more forceful, charts supplied by the department of agriculture. We have asked Mr. Greene regarding the figures which he is using and he writes:

"The United States ranks sixth in the consumption of whole milk, fifth in the consumption of butter and ninth in the consumption of cheese. In 1913 the bulk of the butter that was exported was sent from the following countries, in the proportions indicated: Denmark, 27.9 per cent; Russia, 23.8 per cent; Netherlands, 11.3 per cent; Australia, 10.6 per cent; Sweden, 6.5 per cent; France, 6 per cent; New Zealand, 5.8 per cent; Finland 3.9 per cent; Argentina, 1.1 per cent; other countries, 3.10 per cent. This butter was purchased by the following countries, in the proportions: United Kingdom, 64.4 per cent; Germany, 17 per cent; Belgium, 2.1 per cent; Austria-Hungary, 2.1 per cent; France, 1.9 per cent; Switzerland, 1.6 per cent; Canada, 1.1 per cent; other countries, 9.8 per cent.

"The situation in 1919 was quite different. Denmark exported 11.2 per cent, New Zealand 6.7 per cent, Australia 5.7 per cent, Argentina 4.7 per cent, Netherlands 4.2 per cent, France 0.2 per cent; other countries 3.10 per cent. This butter was purchased by the following countries, in the proportions indicated: United Kingdom, 24.7 per cent; Germany, 7.8 per cent; France, 1.8 per cent; Belgium, 1.6 per cent; Canada, 0.2 per cent; Switzerland, .007 per cent; all other countries, 9.8 per cent.

"It will be noted that the United Kingdom (England) purchased only 24.7 per cent of the world's surplus butter in 1919, whereas she purchased 64.4 per cent of it in 1913. Germany bought only 7.8 per cent of the world's surplus in 1919 as against 17 per cent before the war. The purchases of other countries show practically no change, but the total decrease of purchases is 54 per cent in 1919 of the purchases in 1913.

"When comparing the exports very important changes are noticeable. Denmark fell from 27.9 to 11.2 per cent, Russia is wiped out entirely, while Australia exported about 50 per cent less, her percentage of the total world surplus having been 10.6 per cent in 1913 and only 5.7 in 1919. The exports of New Zealand increased a little, as also did those of Argentina. The Netherlands, however, had very little butter to export in 1919, her shipments amounting to only 4.2 per cent of the total, whereas it was 11.3 in 1913. The decrease in exportable surplus is 67.3 per cent.

"Many countries are ordinarily able to produce butter enough for their own consumption, and these charts and figures show in graphic style that there is really a shortage of butter in the world. If the purchasing ability of consumers can be maintained at the usual level it would seem that dairymen need have no fear for the future."

WATCH FOR STOMACH WORMS

With the approach of warm weather sheep raisers are warned by specialists of the United States department of agriculture to watch for stomach worms and put into practice every known preventive measure. The stomach worm is one of the most serious parasites of sheep, occurring over almost the entire world where there are sheep, cattle and other suitable host animals. In the United States it is most plentiful in the South where it is favored by abundance of warmth and moisture, but it is also quite common and serious in the Middle West and in low, wet areas throughout the entire country. It is present in smaller numbers and does less damage in the high, dry and cool areas of the Rocky Mountain States.

The first things noticed about sheep infested with stomach worms are dullness and lack of thrift. Later the skin becomes pale, as do the linings of the mouth and eyelids, which is due to impoverishment of the blood from the bloodsucking habit of the worms. Infested sheep also may have a swelling under the jaw, known as "bottle jaw."

Stomach worms are spread by the droppings of infested sheep. The eggs of the parasites in the droppings hatch out, and the young worms, which are microscopic in size, crawl up grass blades and are swallowed by sheep as they graze. In the stomach the worms become mature in about three weeks. If the fourth stomach, or rennet, of an infested sheep or lamb be examined soon after death, the stomach worms can be seen squirming about, slender, reddish in color, about an inch long.

Simple and Effective Remedy

A satisfactory remedy for this disease, if used in time, is a one per cent solution of copper sulphate in water. A dose which has been found satisfactory is 100 mils (about three ounces) for yearling and older sheep, and half as much for lambs three months old or older. To make this solution, dissolve one-fourth pound of copper sulphate in one pint of boiling water, then add cold water to make a total of three gallons of the solution. This amount is sufficient to treat 100 adult sheep. The use of this remedy once a month during the grazing season will prevent or greatly reduce losses from stomach worms.

Young animals and uninfested sheep should be separated from older or infested animals. Pastures which have been used by infested animals are dangerous to young animals and uninfested ones. The first essential in preventive measures is to protect young animals, for they are more susceptible to parasitic infestation than older ones. Consequently, the safest pasture should be furnished to the lambs, the older sheep taking the more dangerous land, where it is necessary for sheep to go back to old pasture within a year.

In a plan of rotating pastures to keep down stomach worms, the sheep may be moved over cornfields, hayfields and stubble of various sorts. When different kinds of stock are rotated on pastures, sheep may safely follow horses or swine, but not cattle or goats, as the latter may be infested with stomach worms and a number of other worms common to sheep, goats and cattle.

The state highway commission has advertised for bids on the paved road from Los Banos to the Madera County line, and it is announced that the Merced County supervisors have decided to continue the Merced County highway south three miles to connect with the state road.

TUBERCULOSIS IN GOATS

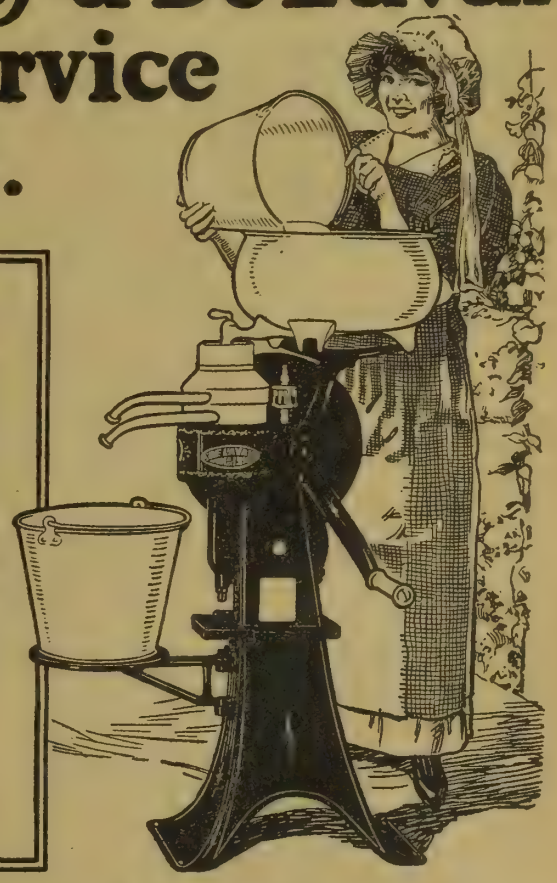
There is widespread opinion that the goat is absolutely immune to tuberculosis. The California department of agriculture calls attention to the following citation taken from an article prepared at the department of veterinary investigation of the Iowa state college at Ames:

"The goat has long been considered highly refractory to tuberculosis infection, a supposition based on limited observation and experimentation. On the basis of the assumption that the goat is rarely tuberculous the substitution of goat milk for cow milk has been extensively made as a prophylactic measure against human tuberculosis. The evidence at hand is that the disease is probably far less prevalent among goats than among cattle, nevertheless its occurrence must be recognized.

TELEGONY NOT PROVED

For a considerable period the opinion prevailed among many breeders of livestock that after a female has once borne young that the progeny by succeeding sires might present characteristics of the first one. This phase of livestock breeding and observation is known as telegony. Many who cling to the theory of telegony base their evidence on a case of the mating of a mare with a zebra producing a hybrid and later mating the mare with a horse, the offspring of which contained markings which resembled those of a zebra. The California department of agriculture notes that extensive experiments have been carried on for the purpose of ascribing certain unusual markings to telegony, but as yet sufficient evidence to prove the theory has not been obtained.

Divide the price of a De Laval by its years of service for its real cost.



THAT the best is the cheapest in the long run is doubly true of the De Laval Cream Separator.

Divide the price of a De Laval by the years of use you will receive — there are thousands in use from ten to twenty years, and even twenty to thirty years is not an unusual life for a De Laval — and you get a yearly cost that is much lower than that of any other separator you can buy.

Consider also that during all these years of use the De Laval will skim with the utmost efficiency; that it will save instead of waste cream; that it will pay for itself over and over and return you the greatest cash income; and you will readily see why it is the most economical separator to buy.

The De Laval serves the longest time and saves the most cream; that's why there are more than 2,500,000 in use the world over.

Furnished with hand, power or electric drives; sold only through agents; and if desired, on such terms that it will pay for itself.

DE LAVAL PACIFIC COMPANY

Some Choice registered Holstein heifers and bulls of serviceable age for sale. J. W. Scudder, Escalon, California.

SEEDS AND PLANTS

For Sale—Celery, Golden Self Blanching from seed bed $1.00 per 100; Stone tomato, 80 cents per 100; Anaheim, Pimento and Bell Peppers $1.50 per 100; Egg Plants $2.00 per 100; Dry Weather Cauliflower $1.00 per 100; Winningstadt Cabbage 70 cents per 100. Reduced prices in larger quantities. Strong and healthy stock. J. M. Chacon, 4431 Hawthorne Street, Los Angeles.

Reliable Seeds—Ask your dealer or write for our Reliable Seeds and instructive catalog. AGGELER & MUSSER SEED COMPANY, 620 S. Spring Street. Branch—767 S. Central Avenue, Los Angeles, Cal.

R*O*S*E*S—$1.50 per dozen. Ornamental and shade trees, shrubs, palms, vines, plants, etc. Write for catlogue. KAVAN NURSERIES, San Bernardino, California.

Free Sample (Hubam or) Annual Sweet Clover (scarified) Genuine Hughes strain. 2c postage. Jas. H. Kitchen, R. 5, Springfield, Ohio.

Napier Grass Rooted Plants postpaid. Second zone 35, third and fourth 30 $1.00. Tinel, Yucaipa, California.

Sweet Potato Plants—Yellow jersey $4.00 per thousand, f. o. b. W. E. Van Gorder, R. 5 Box 91, Santa Ana, California.

For Sale—Sweet potato plants, $4.00 a thousand f. o. b. Santa Ana. H. Beatty, Rd. 3, Santa Ana.

Pumpkin Seed — Mixed Pumpkin Seed. Good germination. 25c per lb. Aurora Seed Mill, Stockton, California.

DUROC-JERSEYS

Weanling Boars and Gilts by Pathfinder Wonder (Great Wonder I Am ex an 800 lb. Pathfinder sow) for $10 each. Bred sows and gilts. Derryfield Farm, Capital National Bank Bldg., Sacramento, California.

Boyanna Big Type Durocs — Breeding stock, priced right for sale. Inquiries invited. Satisfaction guaranteed. J. Boyd Harrold, Dixon, California.

High Class Durocs—Two fine early litters, 10 each. Dam 2nd in strong class, Owensmouth. See A. V. Austin, Van Nuys, California.

BERKSHIRES

ANCHORAGE FARM BERKSHIRES

Orland, California.

BRED GILTS FOR SALE.

Grape Wild Farm—Berkshires, Guernseys, Big Type Berkshire boars of serviceable age, sired by Big Leader, greatest son of Grand Leader 2nd, Panama Pacific Grand Champion. A. B. Humphrey, Prop., Escalon, California.

Lark Meadow Berkshires—Bred or open gilts. Bred sows. Prominent blood lines. Geo. A. Stingle, El Monte. BUY A BERKSHIRE BOAR.

Berkshire Gilts—Bred for late spring litters. Boar pigs of breeding age. Calac Orchards, Martinez, California.

POLAND-CHINAS

Registered Poland Chinas. 40 tried brood sows; 40 gilts. Some choice young boars all at reduced prices to move at once. These Polands are as good as can be had anywhere at any price. W. D. Trewhitt, Route B Box 47, Hanford, Calif.

Big Boned Poland Chinas—Bred gilts and young boars priced to sell at once. Young stock, either sex, for sale at all times, Bassett Bros., Hanford, California.

Bred Poland-China Gilts sired by California Gerstdale and bred to Some Price $75.00 and up. J. A. Crawshaw, Hanford, California.

Big Type Poland Chinas—Breeding stock of both sexes for sale at all times. Prices reasonable. J. N. Cook, Orland.

HAMPSHIRES

Buy Registered Hampshire Hogs for your breeding stock. Write the H. G. Ranch, Solvang, California, what you need and they will send prices.

TRACTORS

For Sale—Beeman Garden Tractor rig $350. For full description write to Albert H. Leavitt, Cloverdale, California.

SCHOOLS AND COLLEGES

ENGINEERING
Thorough, Complete and Practical courses in Civil, Electrical and Mechanical Engineering, Automobile Engineering and Machine Shop. One of the best equipped schools in the United States. No time wasted in non-essentials. Students do actual engineering work. Address Polytechnic College of Engineering, Oakland, California.

HORTICULTURAL PRINTING

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.

TREES

Avocados—I have a limited number of fine trees nicely balled and well established from two to six feet in height which I am offering for from two to three and a half dollars each. Fuerte, Linda, Puebla, Sharpless, Ganter and No. 2. Yearling Valencia trees 75c balled and guaranteed. A. R. Rideout, Rideout Heights, Whittier, California.

For Sale—Placentia Perfection and Eureka walnut trees, also orange, lemons, avocado, loquats and the leading varieties of fruit trees, berries, rhubarb, grape vines, etc., ornamentals and a fine assortment of rose bushes. Ketscher's Nursery, 1101 E 4th Street., Santa Ana, California. Phone 572W.

For Sale — Valencia, Navel, Eureka Lemon, Dancy Tangarine, Rangpur Lime; Supply Company and Tree Performance record buds. One and two years. Cyrus Wilhite Citrus Nurseries, Glendora, California. Phone 303.

For Sale—5000 A-1 Valencia Orange and Eureka Lemons; strong clean yearling buds on sour roots, prices right. Nursery at Montebello. A. R. Thurston, R. F. D. No. 6, Box 895, Los Angeles, California. Phone Boyle 3225.

5,000 Valencias; 2,000 Eureka lemons; 3,000 Mission olives; 100,000 Florida Sour orange seed-bed trees; 50,000 Sweet orange seed-bed trees. SOUTHLAND NURSERIES, 1941 E. Colorado St., Pasadena. Phone Colo. 6352.

For Sale—Navel and Valencia trees for spring and summer planting, exceptionally fine selected buds. Address: Paul Smith, Whittier, R. F. D. No. 1, Phone Whittier 1371.

It's Not Too Late for Planting Vines—4 kinds cheap. 5000 No. 1 Muscats, Trees, Plants, Farm and Garden Seeds. Sudan, Cane, Egyptian Seed Corn. Hay in carloads. Box 501, Fowler, California.

Avocado Trees—Get your orders in now. Mathers Avocado Nursery, Ventura and Rose Streets, Pasadena, P. O. Box 585. Phone Colorado 6044.

For Sale — Loganberry plants, 30,000 tips, 10,000 2 year old plants. Immediate delivery. W. E. Archambeau, Sutherlin, Oregon.

Budded Avocado Trees. Write for special prices for orchard planting. S. & S. AVOCADO NURSERY CO., 15 North Raymond Ave., Room 6, Pasadena, Calif.

400 Mission, 100 Manzanilla Olives, ¾ inch caliper. 2,000 young roses, choicest varieties. South St. Olive Yard, Cornus, California.

200 Late Valencia Orange Trees balled 35 buds—inspector's certificate — to close out at $75.00 per 100. Los Nietos Valley Nursery, Downey, California.

Florida Sour Seed Bed Trees, six to sixteen inches high, straight roots, stocky trees. L. A. Tuttle Nurseries, Route 1, Pasadena.

Florida Sour Seed bed stock. Paul B. Magee, 100 Ventura St., R. F. D. 2, Box 499, Pasadena, California.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale: inspection invited.

California Sweet Seed Bed Stock, 6 inches and upwards. Kloeckner & Lee, 51 N. Chester, Pasadena, California.

MACHINERY

Mr. Farmer Here's Your Chance For Cheap Implements. 1 new No. J. A. John Deere Disk or 6-shovel cultivator for $75.00. 5 No. J. A. John Deere second cultivators, disk or 6-shovels used one season, first class condition for each $60.00 1 No. 919 John Deere corn and bean planter, new $65.00. 1 No. 212 John Deere corn and bean planter, new $70.00. 3 No. 236 John Deere cotton and corn planters, new, each $70.00. Address, Wm. Mumby Hardware Company, Dos Palos, California.

For Sale 50 rebuilt windmills,
50 new and used tanks,
50 brass cylinders, rods, plunger pumps 1-in. to 30-in. capacity.
Why pay more? When you can save so much these times. Send for bargain sheet. Demmitt Co.'s. Office 120 North Main, Los Angeles. 15191.

For Sale—Pomona pump, 28 head, nearly new. Clarence Wagner, Terra Bella, California.

TURKEYS

Large Number of Choice Bronze Toms and hens, also geese and herding Collie Dogs. Shipped from St. Helena and San Miguel. John G. Mee, San Miguel.

"Goldbank" Strain — Giant Bronze turkey toms. Partridge Plymouth Rock chickens. Chicken and turkey eggs in season. M. M. Reiman, Planada, California.

Bourbon Red Turkeys, Buff Ducks, Buff Orpingtons. The Ferris Ranch, Reservoir St., Pomona, California.

SACCHARINE SORGHUMS

(Continued from Page 611.)

grow from eight to ten feet in height. The dwarf varieties also yield a finer quality of brush. Recently a superior type of dwarf broom corn called Acme has been developed by the United States department of agriculture, which produces a brush equal to that of standard broom corn in length. Broom corn requires the same climatic conditions as the other sorghum varieties and is cultivated in the same way in California. About one-half of the entire production is centered in Colusa County, but other parts of the state are equally well suited for its production. Considerable hand labor and technical skill are required in the production of high grade broom corn brush. The brush must be tabled or cut by hand while the seed is still soft and at a time when the brush is bright green in color from base to tip. Brush which is harvested too early is weak and of poor quality. California grown brush is somewhat coarser than eastern brush and is of slightly lower market value. In order to preserve the green color, strength and quality of the brush, it must be cured in the shade, but the seed is first stripped by means of special stripping machinery. It is then spread out in shallow layers on trays, in a drying shed, where it remains until it is thoroughly cured. Care must be taken not to expose the green freshly picked brush to the direct rays of the sun for more than an hour or two. Too much exposure will result in deterioration in both color and quality. After curing the brush must be graded in order to eliminate brush having twisted stems or a large rachis. It is only by careful grading that good market prices can be obtained. The brush is then baled and shipped to the market. Broom corn is not a highly remunerative crop. It costs an average of about $40 per ton to produce and is worth on an average of $75 to $100 per ton, with a top price of $250. Average yields range from 500 to 800 pounds of baled brush per acre, but under especially favorable conditions yields of 1500 to 1800 pounds per acre have been produced.

Broom corn seed has a very low feeding value and is comparable with the saccharine sorghums in this respect. The stover or fodder remaining after the brush has been harvested is coarse and of inferior feeding quality. The stalks are coarse and pithy and the leaves are small and harsh.

The broom corn is a very limited market and may be easily flooded. There is no export demand for this crop.

Sweet Sorghums

Sweet sorghum varieties are used in various parts of the United States in a small way for the production of sorghum syrup, and the varieties which have been most largely used are Honey, Orange, Texas Seeded Ribbon Cane, Sumac, Red Amber, Gooseneck, and Coleman. In California the variety Honey has been reported upon as being satisfactory for this use. The crop is grown essentially in the same way as when grown for forage production, but should be irrigated more frequently in order to keep up the moisture content of the stalks. It is also a desirable practice to plant progressively in blocks at different times in order to lengthen the manufacture period and allow the mill to run continuously through September and October. The crops should be harvested with a row corn binder when the seed is in the early dough and the leaves, heads and suckers stripped from the stalks immediately. The stripped stalks must then be milled within two days after cutting in order to avoid fermentation of the juice. This is done by passing them through heavy pressure rollers operated by horses, gas engines or electric motors. One ton of stalks should yield from 700 to 1,000 pounds of juice, which in turn should yield from 8 to 30 gallons of syrup, depending upon the sugar content. Under good conditions in California one acre of ground should yield from 100 to 300 gallons of syrup. Refining is done by the process of straining through a fine screen, settling and filtering through cloth. Full directions for this process may be found in California Circular No. 198, entitled, "Syrup From Sweet Sorghums," or in the U. S. D. A. Farmers' Bulletin No. 477, entitled, "Sorghum Syrup Manufacture." Any of these may be had from the Agronomy Division, University Farm. Sorghum syrup is used for cooking, canning, preserving fruit and making jellies, and also as a table syrup.

Johnson Grass

Johnson grass resembles Sudan grass very closely in appearance and it is very difficult to distinguish between the two from an examination of the plant above the ground. Johnson grass differs from Sudan grass in having a perennial root system, composed of fleshy jointed underground root stalks. When once Johnson grass has become established in the land it becomes one of the most difficult weed pests to eradicate. Like Sudan grass the tops are destroyed by frost in the early fall, but the fleshy roots remain vigorous and send up a new growth in the late spring or early summer. These grow with such vigor that summer cultivated crops are choked out and cannot be successfully grown. This grass has become a serious pest in several parts of California and every precaution should be taken to avoid introducing it into regions which are at present free from it. It is more widely distributed in Arizona and parts of the Southwest than it is in California and Sudan grass coming from these regions is apt to contain Johnson grass in mixture. The seed of the two grasses are so nearly similar that even an expert analyst cannot always distinguish between them. For these reasons Sudan grass seed from Johnson grass infested areas should not be sown, moreover there is a California law prohibiting the sowing of Johnson grass.

Sorghum Poisoning

All varieties of the sorghum family, including Johnson grass, may become poisonous under certain conditions which are not thoroughly understood. When the plants have been stunted by frosts or severe drouth they are liable to become poisonous and should be pastured with caution. Losses of livestock from eating poisonous sorghums have been most frequent from Johnson grass, but very few authentic cases of poison have been reported from other members of the sorghum family. The poisonous principle which develops in these plants is commonly called prussic acid and is the same as exists in wild cherry, casavas and kernels of the peach, plum and bitter almond. Plants which are known to contain this poison lose it entirely upon curing, and cured fodder may be fed with safety even though it has been known to be poisonous while green in the field. The symptoms of stock having eaten poisonous plants are staggering or falling, the eyes become motionless or dilated, the heart action is slow, respiration becomes convulsive and death usually follows within a few minutes after the animal has taken the poison. If the animal lives for thirty minutes after taking the poison into the stomach there are chances for its recovery. An analysis of the stomach of animals killed by sorghum poisoning is of no value for the reason that prussic acid is a glucoside which is rapidly absorbed and disappears. An animal suffering from prussic acid should be placed in the shade with its head above the level of its body and if bloating occurs the pouch should be punctured. It has also been recommended that ammonia be inhaled to start heart action, and a drench consisting of equal parts of hydrogen peroxide and water has been recommended as an antidote. A further remedy which is recommended in sorghum poisoning is found in California Leaflet No. 9, entitled, "Precautions Against Poisoning by Johnson Grass and Other Sorghums," as follows:

Dissolve one ounce of sodium carbonate in one pint of water, place it in a quart bottle and cork well. Secondly, dissolve one-half ounce iron sulphate in one pint of water and place in a second quart bottle and cork well. Mix the contents of the two bottles, shake well and administer as a drench.

BORDEAUX SPRAY FOR POTATOES

The Minnesota agricultural experiment station has compiled the results of spraying experiments carried on at the station for a number of years, from which it appears that the average increase in yield from spraying in the absence of late blight has been more than 30 bushels per acre for late varieties and about 27 bushels for early varieties. The most satisfactory formula for use is said to be the 5:5:50 Bordeaux mixture. Equally satisfactory results were reported from several substations as well as from cooperative tests under farm conditions.

HOLT ANNOUNCES NEW TRACTOR

The Holt Manufacturing Company announces its new Western ten ton "Caterpillar," designed along the same lines as the ten ton Holt used by the government during the war, but particularly adapted to meet the severe conditions of power farming on the Coast. Its motor develops more than 60 horsepower and its drawbar rating is 38 horsepower.

Long life and low upkeep cost have always been features of the Holt product. These qualities are emphasized in the Western. The Holt metallurgical laboratories have developed stronger, longer wearing steels and alloys. Common sense engineering has developed features of design that minimize friction and wear. The improved motor, for example, has pressure oil feed to the crankshaft bearings, providing a positive oil film in which the shaft floats, preventing metal to metal contact. And not only is the oil compelled by the new pressure feed system to do full lubricating duty, but all possibility of pollution by dirt and dust is eliminated. The new motor is perfectly protected against the entrance of dust and dirt — valve push rods are enclosed, the cylinder heads are completely covered, there are new dust proof and dirt proof types of breather and oil filler, a new and perfected air cleaner is standard equipment. The transmission has big bearings, cut steel gears, both gears and bearings perfectly lubricated. Throughout the tractor, both in the making of parts and the assembling of the complete machine, the most exacting standards of accuracy are rigidly maintained, a factor of utmost importance in contributing to long tractor life.

It gains its wide adaptability by means of its flexible power, that gives it ample power capacity for big jobs, together with operating economy for light jobs. Then there are its features of compact construction and short turning ability, that make this tractor invaluable for high power orchard work, logging and road work, as well as general farm work of all sorts.

Full spring mounting is an especially attractive and valuable feature. The spring mounting relieves the strains and jerks and jars of the more or less continual rough ground travel that every tractor encounters, greatly increasing the life and service of this tractor.

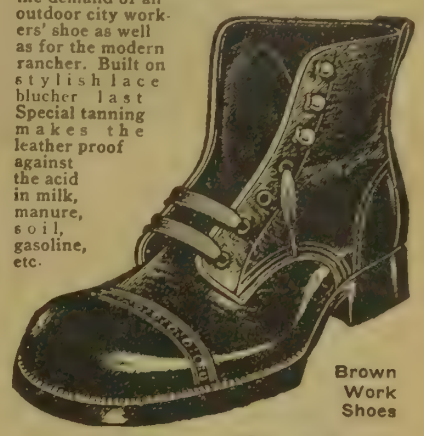
Another exclusive feature is the split truck construction that makes perfect flexibility of the track—an advantage in all work and a feature that adapts this tractor to extreme rough ground work.

It is exceptionally easy to operate and convenient for the operator. The steering column carries spark and throttle control and the two armed clutch control that releases the drive to either track. Hand levers control the master clutch and gear shift. A geared hand starter is operated from the driver's deck. The fuel tank is filled from the deck and the flow of oil to the tracks controlled from the deck.

The Western is notable for its accessibility. By the removal of the hood the motor is made completely accessible and the interior of the crankcase can easily be reached by taking off large removable side plates. By making care and operation a simple matter, insurance is provided that the machine will be given the necessary attention to keep it in best condition.

Dont Send a Penny

These Work and Outdoor Shoes are such wonderful values that we will gladly send them to you by mail, no money down. You will find them so well made and such a big money-saving bargain that you will surely keep them. No need to pay higher prices when you can buy direct from us. Why pay $6.00 or $7.00 for shoes not near so good? This shoe is built to meet the demand of an outdoor city workers' shoe as well as for the modern rancher. Built on stylish lace blucher last. Special tanning makes the leather proof against the acid in milk, manure, soil, gasoline, etc.



Brown Work Shoes

Double leather soles and heels. Dirt and waterproof tongue. Heavy chrome leather tops. Just slip them on and see if they are not the most comfortable, most wonderful shoes you ever wore. Pay only $2.98 for shoes on arrival. If, after careful examination, you don't find them all you expect, send them back and we will return your money. SEND your name and address, and be sure to state size and width you want.

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote — "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa.—"Not a case of white diarrhoea in three years." C. O. Petrain, Moline, Ill.—"I never had a sick chick all last season." Mrs. Wm. Christiana, Olive Ridge, N. Y.—"Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, sniffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and $1.50 pkgs. Baby Chick Book FREE.

Turkeys and How to Raise Them

By Jean A. Koethen

SOME weeks ago a letter from a Cultivator subscriber asked for an article on this topic, and I am glad enough to comply, but the question of how to raise them is not the easiest in the world to answer. I have interviewed a good many turkey breeders the last few years and read all the literature I could get hold of, to say nothing of doing a little experimenting on my own account, and the more I hear and read and experiment the less I know. Everybody has a different method, and the Rhode Island Station, which is a leading investigator, says, "If you have found a method of feeding which gives fair results, do not change it," so we are forced to conclude that the secret of raising every turkey hatched, or even 90 per cent of them, has not been discvered.

In the hope of getting new light I wrote the Rhode Island station for any publication they might have issued since 1916, but received no answer. Then I went to see Mrs. Middleton.

Six years ago Mr. and Mrs. T. T. Middleton bought a little place at Lankershim, named it "Lone Star Ranch," and started raising turkeys. Mr. Middleton spends his days carrying mail for the city of Los Angeles and his nights studying turkey probems. Mrs. Middleton mothers the little turkeys along with her own two husky youngsters, and she has worked out a pretty satisfactory system for both turkeys and children, if one may judge by the rosy cheeks of the latter and the glossy plumage and bright heads of the former. "I have not found the secret yet," she declares modestly, "for raising every turkey, but last year I raised 75 per cent, and this year I am bound to do better. One year I raised only one turkey."

Last year the Middletons raised 150 turkeys, and all but those reserved for breeding were sold alive to customers who came to the ranch for them for 50 cents a pound, a result which fully justifies their six years of effort and study.

Breeding Stock

Fifty breeding turkey hens are kept on Lone Star Ranch. For the most part they are yearling hens, not because two-year-old hens are not preferred, but because thy are not available. The young hens, however, selected for vigor and early maturity, and mated to two year old toms, ten hens to a tom, have laid eggs with strong fertility and excellent hatchability. In the pens where older hens are used they are mated to young toms. Twenty hens last year laid 1600 eggs. Several extra toms are kept, but except in case of sickness it is not often necessary to change the matings.

The breeders receive a laying mash with extra beef scrap added, two handfuls to a large pail of the mash. This is kept before them constantly, and they have milo maize at night, with all the greens they will consume at noon. They are kept confined, and—rain or shine—roost on uncovered roosts in their runs.

Artificial Brooding

Every poult is hatched in an incubator and raised in the brooder house around a big brooder stove. Neither turkey nor chicken hens are to be trusted as mothers, in Mrs. Middleton's opinion A brooder stove does not uncover the poults and let them get chilled in the early morning, neither does it drag them out into the fog nor overfeed them. Even a stove, however, needs managing, and Mrs. Middleton has worked out quite a nice little system of brooding.

As soon as the poults are dry they are removed from the incubator to the brooder house. This is usually the morning after the hatch is completed, and it is important that they be moved in the morning rather than at night. The stove has been lighted for 48 hours in preparation for the poults, and the temperature is kept steadily at 85 degrees. "Keep them comfortable, but not too warm," is Mrs. Middleton's rule, and she lowers the temperature just as rapidly as she can and still keep the poults comfortable.

On warm days the heat can be turned very low or perhaps turned off altogether, but the birds are given some heat at night till they have learned to roost, at about two months of age.

POULTRYMAN'S CALENDAR—MAY, THE TURKEY MONTH

May is not exclusively the turkey month. The big turkey breeders began to get out their birds in March. But it is the time when the backlotter and farmer aim to begin to raise their Thanksgiving birds and is perhaps as good a time as any.

May is also fattening time for the early cockerels. They should be penned in small yards when they are separated from the pullets and given a ration rich in corn and ground oats with as much milk as possible. The Cornell ration for fattening with milk consists of 50 pounds corn meal, 20 pounds wheat middlings and 10 pounds ground heavy oats. This is mixed to a batter for each feeding with buttermilk or skim milk. If milk is not available 20 pounds meat scrap is added to the ground grain, and the mash is mixed to a batter with water. The fattening ration used at Purdue consists of 2 pounds corn meal, 1 pound each of shorts and ground oats and 8 pounds buttermilk. These rations are not given a ration rich in corn and ground oaths, with as much milk as posmay have cracked corn, barley, and a moist mash once or twice a day.

No rule can be given for temperature with turkeys. They must be watched and kept comfortable just like children. If they are allowed out in the sun that first day—and there is no reason why they should not go out if the sun is warm—they must be brought in at the first signs of huddling.

But the most interesting part of the Lone Star brooding system is the way the poults are put to bed at night. They are not allowed to huddle around the stove. Little wire boxes about two feet square are provided, a box for every 25 poults, and on each box is a hover with long pieces of felt or flannel to lie on the poults' backs, just like those used in fireless brooders. As night approaches the poults are tucked away in these brooders, which have been warmly lined with straw or hay. The hovers, which are hung from the ceilings by pulleys, are lowered so that they almost rest on the tops of the boxes, but not quite, for there must be a crack for ventilation. A piece of galvanized iron as wide as the stove is high is put around it to shut off as much as possible of the heat, and the temperature is run as low as can be

This seems to me a very carefully worked out brooding plan. The poults which are so easily chilled, are kept warm in their snug brooders, yet are in no danger of piling up on top of one another, which has been the main objection to brooders. In the morning the heat is run up before the poults are let out, and when the room is warm they may go where they please Little gates let them into the runs outside if the weather is suitable. As many as 500 poults can be brooded at once by this method, and everyone kept warm and comfortable.

Feeding the Babies

Water and grit are placed before the poults as soon as they are in the brooder house, but they are not fed till the morning of the second day when they are about 48 hours old.

Hardboiled egg, stale bread or rolled oats, and onion tops or fresh alfalfa cut fine, all chopped together, are the nursery feed. I tried to make Mrs Middleton say in just what proportion she mixed these three ingredients, but

she would not for fear she might not remember exactly. The green feed, she thought, was about one-fourth the whole—as for the egg and bread, she just mixed them till they looked right. Then I tried to get her to remember how many eggs she used for 50 poults, but that she did not dare to say, as she could spare. Whatever the proportion, this mixture is fed at first four times a day, with a single change in omitting that it depended on how many the evening meal, the last before they go into their brooders. At this meal one large onion for about 50 poults is chopped fine and added to the egg and bread and green mixture.

Then I tried to pin her down again. How much did she feed at this first meal and the subsequent feedings that first week? How many teaspoons to 50 poults, say, but she didn't measure it that way. The mixture is spread on a clean flat board and left there, Mrs. Middleton was sure, not more than a minute, for the only rule for feeding is, "Keep them hungry." The time of feeding is lengthened a little as the poults grow, but always the food is taken away while they are still hungry.

As the poults approach three weeks in age a change is commenced in their ration. In place of part of the bread and egg they get rolled breakfast oats moistened with sweet or sour milk. The change must be gradual, but by the time they are four weeks old they are off the bread and egg and on the rolled oats. At about three weeks the four meals a day are diminished to three, and at six weeks the three meals are changed to two. A little grit and some greens, preferably onion tops, are mixed in every meal the first three weeks, and the alfalfa is mixed with the oats till the end of the six weeks.

When the poults are three weeks old growing chick mash is placed before them, at first just for a short time, but later for the whole day.

At the end of the sixth week this ration is changed to soaked rolled barley morning and night and mash before them all day with cut alfalfa at noon. The rolled barley is soaked 12 hours, then the water is poured off, charcoal added, and the whole dried with bran till it is crumbly. This is their ration from the sixth week till they are ready to fatten in the fall.

Fattening

Corn meal moistened with boiling water till crumbly, is the main dependence for fattening. This is at first added gradually to the soaked barley and bran, beginning about the middle of October. The last week before the birds go to market this corn meal mush is kept before them constantly. Some whole corn is given, but the birds do not eat it readily.

Poultry Queries

Conducted by Jean A. Koethen

Rolley Barley

Is rolled barley good for chickens? —Subscriber, Puente.

Rolled barley is one of the standard poultry feeds, but it should not be fed to the exclusion of other grains. Barley alone puts too much fat on the body of the average hen, and the fiber is apt to make trouble sooner or later. Fed with wheat or milo or both it is a very satisfactory feed.

Corns

Can you tell me the cause of corns on the feet of my year old pullets? They roosted at first on 1 by 4 roosts, but now have 2 by 2, rounded on top. Our soil is coarse sand.—Subscriber.

I think what you call corns must be bruises on the bottoms of the feet, due probably to jumping from a too high roost. You should examine them carefully to make sure there is no pus. Should you find pus, open the swellings, wash with carbolized water and paint the entire surface of the cavity with a solution of nitrate of silver, ten grains to an ounce of boiled water. The foot should then be poulticed and wrapped to prevent filth and dirt from getting into the opening. This is commonly called bumblefoot. It hardly seems as if the narrow, rounding roosts could be harmful to the feet, but there is no object whatever in having them rounding. A hen can keep her place on a wide flat roost without effort, and is more comfortable.

Leg Weakness

What is the cause and cure for leg weakness in chicks a few weeks old? —Subscriber.

Overfeeding, which makes the body put on weight too fast, and lack of the exercise necessary to keep the strength of the leg muscles proportionate to the weight they have to carry are the main causes of leg weakness. Sometimes chicks that have been overheated in a brooder develop leg weakness without other apparent cause. The remedy is, of course, as much exercise as can possibly be given and a ration containing more protein and ash and less carbohydrates. Sprouted oats, rolled oats, sour or skim milk, five per cent bone meal added to the mash, will all help muscle development, but exercise is the main thing.

Breed From the Best

My 20 hens have done splendid laying this year. Shall I get a good rooster and breed from them next winter or buy baby chicks again — Subscriber, Mrs. S., Madera.

If you wish to build up a strain of your own select from the 20 the five or six hens which you know are your best layers, then purchase the best cockerel you can afford. If he is the son of a hen that made a record of 200 eggs or better in her pullet year you will have a worth while foundation on which to build. If your only aim is market eggs it may be less trouble to buy the chicks.

EGG BREAKAGE

The California Poultry Association has for years been urging greater care in the handling of eggs, especially to reduce the cracks, on poultry ranches in hauling to shipper and shipping to market. The department of agriculture has entered into the campaign and we now have from an express company a four page paper, "The Eggspress Agent," aiding in the campaign for better packing and better handling. One cracked egg isn't much, but many gathered together are quite some. The "Eggspress" says:

"The egg production of the United States in 1920 was said to be 67,000,000 standard cases, with an estimated value of $1,206,000,000. As the standard case contains 30 dozen, the annual egg output last year amounted to 2,010,000,000 dozens, or 24,012,000,000 eggs.

"The value of these billions of eggs seems like a part of the national debt. And while the loss of $1,267,000 seems a comparatively small figure beside it, our loss and damage claims on eggs made a big dent in the company's revenue. And no one profited by it—neither the shippers, the carrier or the expressman."

After eggs have been laid four days their likelihood of hatching depreciates at the rate of four per cent a day, according to the observation of Ohio chick hatchery managers. And if eggs are set after the twentieth day they are found to be practically worthless for hatching.

Baby Chicks

Largest assortment of baby chicks in the West. Hatched in the RIGHT way. Can ship Express or Parcel Post. We carry a complete line of poultry supplies. Fireless brooders that are made to care for chicks properly. Chicks shipped safely in these brooders. Breeding and Pet stock of all kinds. Write us your wants. Send for price list. Dogs, cats and rabbits.

Stock Raising in WESTERN CANADA

is as profitable as grain growing. Successes as wonderful as those from growing wheat, oats, barley, and flax have been made in **raising Horses, Cattle, Sheep and Hogs.** Bright, sunny climate, nutritious grasses, good water, enormous fodder crops—these spell success to the farmer and stock raiser. And remember, you can **buy on easy terms**

Farm Land at $15 to $30 An Acre

—land equal to that which through many years has yielded from **20 to 45 bushels of wheat to the acre**—grazing land convenient to good grain farms at proportionately low prices. These lands have every rural convenience; good schools, churches, roads, telephones, etc., close to live towns and good markets.

If you want to get back to the farm, or to farm on a larger scale than is possible under your present conditions, **investigate what Western Canada has to offer you.**

For illustrated literature with maps and particulars regarding reduced railway rates, location of land, etc., apply to Department of Immigration, Ottawa, Canada, or

Dry flint hides—No. 1 hides, 16 lbs. and up, 9 per lb.; No. 1 kips, 6 to 16 lbs., 9 per lb.; No. 1 calf skins, under 6 lbs., 10 per lb.; No. 2 hides and skins, 6 lbs., 10 per lb.; No. 2 hides and skins, 2 less; glue hides and skins, 2 per lb.

Pelts: Large, long wool, 40@70 each; medium, 20@40 each; short wool and shearlings, 10@20.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock May 3, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies liberal, market firm. Idahos: Russets mostly 2.25@2.50, Rurals 1.90 @ 2.00. Oregons: Burbanks, 2.25@2.35; few 2.50. New potatoes: Supplies liberal, market steady, best 1.90@2.10, small 90@1.10 per lug; jobbing sales best 1.80@2.00. Sweet potatoes: Supplies liberal, market firm. Mostly 2.25@2.50 per lug. Oklahomas: 6@7½ per lb.; jobbing sales 7 per lb.

Onions: Supplies heavy, market dull. Stocktons: White Globes and Browns, cold storage stock best 1.00, poorer 60@75 per cwt. Local: Per bunch green mostly 12½. Coachella Valley: Practically no sales. Imperial Valley: Bushel crate, Yellows 1.20, Wax 1.40.

Garlic: Supplies liberal, market dull. Wide range in quality and condition. Best mostly 10@13, poorer 7@9 per lb. New 12@15 lb.; few higher.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock May 3, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Supplies heavy, market weak, 50@75; few fancy 1.00 doz.

Asparagus: Market steady, supplies liberal: Local: Mostly 14@16 per lb. Northern, 9@12 per lb.; jobbing sales 9@11 per lb.

Beans: Supplies liberal. Per lb., Green Kentucky Wonders 21@23 per lb., green pods 15@17 per lb., Wax 15@16 per lb.

Beets: Doz., 30@40.

Cabbage: Field crate best mostly 1.35@1.50.

Carrots: Doz., 35@40.

Cucumbers: Hothouse, best, 3.00 doz.; poorer 2.50@2.75.

Lettuce: Local field crate quality poor, 75@1.00; best mostly 1.20@1.30.

Peas: Local: 7@8 per lb.; jobbing sales 6½@7½ per lb.

Radishes: 25@30 doz.

Rhubarb: Local strawberry 1.00@1.19 bx.; jobbing 90@1.00.

Spinach: Mostly 20@25 doz.

Squash: Summer, 1.50@1.65; Italian per flat 1.25.

Tomatoes: Mexican, per lug, best repacked 3.00@3.50; Imperial Valley crates small to large 1.20@2.00; jobbing 1.60.@1.85.

Turnips: Doz., 40@45.

FRESH FRUITS

Cherries: Lb., 30.

Strawberries: Supplies moderate, market weaker. Per crate, 30 pints, best 3.50@4.00; poorer 2.00@3.00.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.50, special packed brands 2.75@3.00.

Lemons: Supplies heavy, market dull, wide range in prices. Local: packed box 1.50@2.25, few high as 2.75, loose 75@1.00 per box, per lug mostly 40@50.

Oranges: Supplies firm, market firm. Navels, market pack, large sizes 3.00@3.50, small low as 1.75, special brands, large sizes 4.00@4.75, small sizes 3.00@3.50. Valencias, best brands, all sizes 3.75@4.00, packing house culls 50@75, few best 1.00@1.75 per box. Tangerines: Supplies liberal, market steady, best 6@7½ per lb., small 4 per lb.

HONEY

Supplies of honey are still generally heavy, but old crop is cleaning up in some sections. Poor wire inquiry. Movement slow, market weak. Carloads f. o. b. usual terms: Per pound, few sales of White Orange Blossom 12½@13; White Sage 12@12½; light Amber Alfalfa 6@6½; Light Amber Sage 7½@8½; White Alfalfa 7½@8; Hawaiian White 7; Light Amber 6; Honey Dew 4½. Producers are reported as offering contracts for new crop. White Orange Blossom 10 per lb., but buyers are holding off. Prospects for the honey crop are generally favorable throughout the state, except in the San Diego district and Salinas Valley, where rainfall has been very light. Darker grades of honey are now on cheap price basis and competing with sugar for commercial use. The outlook is for a continued downward trend in prices for the darker colored stock.

GRAIN AND FEEDS

Grain Exch. price bid May 3:
Wheat: Mixed feed 34.25.
Corn: Bulk, No. 2, Yellow 1.63¾; No. 2, White 1.62 1/3.
Bran: Kansas, 31.00.
Kaffir: Eastern, 1.58¾.
Milo: Carlots, 1.56¼.
Barley: 1.32½.

HAY

Alfalfa Growers of California report under date of May 2:

There were 330 tons received on the Los Angeles tracks the week ending April 30 with 100 tons held over as against 260 tons the week before.

Rabbit Alfalfa	25.00
No. 1 Dairy	21.00
Standard	18.00
Stock	15.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	20.00@30.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	20.00
Standard	14.00@16.00
Straw	10.00@13.00

Special Offer!
Midwest Utilitor

The Utilitor has proven its ability and economy in farm work. Plows, harrows, cultivates orchards, vines or row crops. Four horse power for belt driven work of all kinds.

Easily pulls a field mower or rake in alfalfa or grain. Ease of handling and positive control are distinctive Utilitor features. One gallon of gas provides power for 6 to 8 hours.

We have a special offer on a Utilitor to one person in each locality. Only one can be placed special in each neighborhood. If you have use for a small tractor write for particulars. If successful it means money saved and additional profit for you.
